Whereas, the interruption of air traffic for any specified period of time will undoubtedly cause negative economic impact; and

Whereas, wind development and any other types of tower development may be stymied by the expansion of the Powder River Training Complex; and

Whereas, our larger sister cities of Spearfish, Rapid City, Sturgis, Belle Fourche and larger cities lying outside of South Dakota including Dickinson, Bismarck, Miles City and Gillette will not be included in the Powder River Complex Expansion and unfairly targeting lower population areas to carry the brunt of this training area; and

Whereas, the City of Lemmon derives its economic base and existence from agriculture, including the production of livestock and management of thousands of acres of grassland that could be endangered by the increase risk of fire; and

Whereas, agricultural producer's property values will likely suffer from the military activity that will take place in many cases five hundred fifty feet above their property, cause noise, inconvenience and a breach of quiet enjoyment of their property; and

Whereas, the private property rights of area landowners will be infringed upon by the expansion of the Powder River Complex Expansion; and

Whereas, other private property owners are compensated when the government devalues property and are deemed a taking; and

Whereas, the Air Force has alternatives for training exercises and the expansion of the Powder River Complex is not necessary; and

estimated that a bundle of the new chaff will cost about 40 percent more than it does currently.

NO SYSTEMATIC FOLLOW-UP ON
OPEN QUESTIONS

---------- Letter :5.5

Studies by DOD and others, including some carried out years ago, continue to create questions in the public's mind about the health and environmental effects of chaff. Department records indicate that DOD has not systematically followed up on these reports to determine the merits of any outstanding question or the costs and benefits of addressing them.

While none of the studies we reviewed demonstrated significant operational or environmental effects of chaff, 9 of the 10 reports cited gaps in information on potential effects. Six of the nine made no recommendations but cited missing data, suggested additional studies or long-term monitoring, or cited possible long-term chronic effects. Three reports recommended additional studies covering chaff toxicity, long-term exposure, weathering, or other study areas. However, DOD has not reviewed the recommendations and information gaps cited in the reports in a comprehensive and systematic way to assess their merits for further actions. For example, the Army's January 1992 report cites data gaps and recommends that the long-term risk and chronic exposure of inhaled fibers be evaluated. Specifically, it recommends

-- future research on the resuspension rates of uncoated and coated fibers;

-- studies to establish the weathering rates and chemical fate of metal coatings in soils, fresh water, and marine waters;

-- a comprehensive review of threshold metal toxicity values for humans, animals, and important fresh water and marine organisms;

-- a series of experiments to evaluate the potential impacts of fibers;

-- an examination of the respirability of fibrous particles in avian species;

-- aquatic and marine studies to establish the potential impacts of fibers; and

-- future research on the pathology of inhaled fibers.

The second and third of the above recommendations were partially addressed in the Army's September 1992 report. Two other reports also partially addressed the second recommendation.\13 We found limited evidence of follow-up on the other five recommendations.

The 1997 Air Force study and its technical reports also cite the need for data and further research, including long-term studies. Two of the three technical reports recommend further research. One suggests long-term studies to monitor chaff accumulation on water bodies in high-use areas and the effects on animals using those water bodies. Another states that consideration could be given to monitoring programs for highly sensitive environments subjected to repeated chaff releases and conducting bioassay tests to further assess the toxicity of chaff to aquatic organisms. The final report noted that in some cases it might be appropriate to analyze the potential for impacts to highly sensitive aquatic habitats that support threatened

CONCLUSIONS

---------- Letter :6

1039

DOD and the services have developed ongoing initiatives to address certain concerns raised by the military's use of chaff. These initiatives include plans for increased liaison with agencies such as BLM, FWS, and NWS. Nevertheless, the public, DOD studies, and other federal agencies continue to raise questions about the potential adverse effects of chaff. DOD has not systematically followed up to determine whether these questions merit further action. Further, the Navy has initiated a degradable chaff research and development program but has not yet completely analyzed the operational and environmental benefits it expects to achieve. Lastly, although lead-based chaff has not been produced since 1987 and is no longer reported used, it is still retained in DOD's inventory.

November 6, 2010

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms DeVine:

As a former Commander of the 5th Bomb Wing at Minot AFB, ND (1998-2000), I am keenly interested in our flight crews continuing to have the opportunity for quality training. The downtown community, over the last number of years, proposed an expanded MOA in North Dakota for the exact type of training exercises that are envisioned to occur within the expanded Powder River Training Complex.

Having reviewed the Draft EIS, I support the preferred Alternative identified in the process for a number of reasons. First, the range offers the opportunity to "train like we fight." Additionally, the proximity to the training complex saves jet fuel in a time where we have constrained budgets. Finally, the proximity to the training complex would also mean a higher quality of life for the airmen and their families because of less time away from home for a TDY. I know first-hand the impact deployments and contingency operations have on our Air Force family members. GE-1

I noted a number of concerns identified by landowner groups located in and around the complex. We believe that those concerns can be met or mitigated by identifying avoidance zones similar to areas called out for avoidance because of Native American sacred grounds. Conceivably this could include round-up areas, birthing areas, watering holes and the like. We encourage the Air Force to pursue these types of arrangements with the affected landowners. NO-10 GE-11

Again, I support the preferred alternative identified in the draft EIS for the expanded Powder River Training Complex. GE-1

Very Respectfully,

Greg Power

My concern is for the safety of both local pilots in the training area and the military pilots. Both need reliable information when actual training is in progress to avoid midair collisions. I am a pilot and I would like to have a transponder we could place in our planes that you could detect and see us. Should this not be feasible a phone number we could call before we fly to see if the training area is, or soon will be in use would be helpful. Whatever the method we need to know when the military is training so we can avoid each other. SA-1 AM-3 AM-12

WRITTEN COMMENT SHEET
PUBLIC HEARING FOR THE
PROPOSED POWDER RIVER TRAINING COMPLEX

The following statement is my public comment on the EIS for the Powder River Training Complex, put out in August 2010. I live in the Northeast corner of Wyoming, and I am not in favor of Alternatives A, B, or C. Our county's economy relies on ranching, tourism, revenue from hunters, and home and land resale; all of which will be negatively affected by these alternatives. These alternatives also will be detrimental to the environment, livestock, wildlife, and to our quality of life. GE-2 SO-9 SO-1 LU-1

I do not feel that the Air Force has submitted a true and honest EIS as the impacts for the proposed areas will have wide spread negative impacts on our area. The EIS seems to be swayed towards the needs of the Air Force not for the concern of the public and environment. NP-11

Noise

The EIS states that there will be environmental impacts from an increase in ambient noise levels, low-level startle effects, and sonic booms. This will definitely have negative impacts on the way of life and on wildlife in our area. We have already had our horses run through a fence due to the noise from a low level flight were we could actually see the pilot. LU-2

Some of the noise levels stated in the EIS are beyond EPA recommended levels for people to be exposed to for more than a couple of minutes with out causing hearing damage. Sonic booms it was stated will produce about 4 pounds of pressure per square foot. That relates to 139 db which is way beyond what the human ear should safely be exposed to. How can this effect be minimal? NO-5

The increased noise level will destroy a way of life for many persons living in the proposed area. We may not have a large population but we do have a population. LU-2

These increased noise levels also present a huge safety issue for the ranchers, cowboys, and recreational riders who work closely with livestock; doctoring them, shoeing them, riding them to round up cattle or for enjoyment, and all other forms of interaction. There is a great deal of chance of putting the people and animals in harm's way, due to animals' reactions to these sudden loud noises. A person working with a horse, or riding a horse when a sonic boom occurs could be thrown off, kicked, and even trampled. Serious injuries could easily occur around any livestock in this event; far more serious than being "annoyed". SA-9

Safety:

The dropping of chaff is not proven to be safe to humans and the environment and should not be performed were there is a population of people. We do not wish to be part of an experiment to find out what effects of dropping chaff on a population are. I do not agree that there will be no impact from the dropping of chaff. SA-14

1045

Dropping of flares is a safety issue that should be addressed. Dropping of flares in a populated area with high fire danger is not what I would call low impact. We do not need dudes or parts of flares dropping on our properties.
The biggest problem from the flares is that there is a high probability that these could cause a devastating wildfire. SA-5

In conclusion, I feel that the EIS has not addressed the full potential of the negative impacts to the areas that stand to be affected by this proposal. Just because there is a smaller population in these areas, does not mean that there should be less concern for our safety, our livelihoods, or our quality of life. It would be a huge disservice to those who have chosen to make our living and establish our homes in these areas, to allow this proposal to so negatively affect our lives. AS A VETERAN I UNDERSTAND THE IMPORTANCE OF GOOD TRAINING FOR OUR MILITARY BUT IT SHOULD NOT COME AT SUCH A HIGH COST TO OUR WAY OF LIFE THAT THEY FIGHT TO DEFEND. There are many remote areas without populations such as ours that they could perform these maneuvers and obtain the skills they need. Please do not rune our way of life do not change the current MOA or mode of operation. EJ-2 LU-1 PN-2 GE-2

1046

January 6, 2011

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews St., Room 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine,

I am writing in protest of the expansion of the PRTC special-use air space. GE-2

Since the Air Force has made no plans to fully utilize the training value of the Hays MOA, why is this expansion even being considered? PN-2

The environmental damage as well as the disruption of ranching and farming in this area surely should be of greater consideration as well as the threat to commercial and private aviation jobs in the affected area. LU-2 SO-7

The deployment of flares and metallic chaff would be a serious hazard to non-participating VFR aircraft. SA-26

My husband and I live near the Ellsworth Air Force Base in air space that would be affected by this expansion. My husband is retired Air Force who spent 50 years serving his country. We are staunch supporters of the U.S. military, but both the human, commercial and environmental impact of this project is unnecessary and unconscionable. GE-3

Sincerely,

Jean Rosenkranz

Good morning. The Draft EIS details the potential environmental consequences to air quality in Chapter 4.4 (page 4-61). Details regarding the aircraft emission factors used to quantify the potential impacts can be found in Appendix J. Appendix J, Table 1 provides the fuel flow rate in Lb/HR (JP-8--6.8 lb/gallon) and can be used to estimate fuel consumption when used in concert with Table 2-16 which estimates time spent in each airspace unit (DEIS pg 2-63).

An electronic copy of the DEIS and its appendices can be found and downloaded at http://www.accplanning.org/open_for_comment.html#PRTC. Please let me know if you have difficulty downloading the document or if you would like me to mail you an electronic copy.

Thank you for your interest in this proposed action.

RE: Powder River Training Complex DRAFT EIS

Dear Ms. DeVine;

I would urge the United States Air Force to select the **no action alternative in the Powder River Training Complex DRAFT EIS.** Expanding the activities into additional areas is unnecessary. The United States Air Force has other areas where the described training activities can be conducted. GE-2 PN-2

The proposed activities will cause pollution from employment of chaff and flares, increase the potential of fires, cause noise pollution, and destroy the solitude of this remote area. AQ-3 SA-6

The Muller Ranch is a historic ranch located within and adjacent to the proposed PR-1BMOA in Wyoming and Montana. One of the true values of this remote ranch is the solitude. This proposal would destroy that value with increased ambient noises levels, sonic booms, and low-level startle noise effects. LU-2

The Muller Ranch makes a concerted effort to not have trash and pollutants on the ranch. This proposal will allow chaff and flares to fall to the ground as pollution. Since the chaff fibers may be dispersed by the wind and altitude, they may spread over a large area. The flares likewise leave debris on the ground as well as some live flares (1<%) on the ground as a hazard. There is the potential for harm to local residents from these duds. SA-27

This is a remote area and range fires are hard to contain due to rough terrain and distance to fire fighting equipment. The landowners in Sheridan County have been urged to join fire districts to combat this hazard. The Muller Ranch has joined such a fire district and is paying an additional assessment on its county taxes to cover this cost. It is unfair and economic burden to expect the local community to pick up this additional service burden for Ellsworth and Minot Air Force Bases. SA-5

It is projected that 8,300 bundles of chaff and 820 flares could be dropped annually in the area that the Muller Ranch lies in. This means that about 8 un-ignited flares (~1%) will be lying on the ground. Each flare will burn at approximately 1,202 degrees Fahrenheit. Each chaff bundle consists of about 5 million chaff fibers. Each year in the area around the ranch that would be 6.8 billion pieces of SA-27

1050

angel hair chaff would be release. The impact of the chaff on wildlife, air quality and general quality of the environment is unknown. Because it is fine texture, it has the potential to be ingested by wildlife such as sage grouse. These potential impacts along with the considerable noise and loss of solitude make this an undesirable and potentially environmentally harmful project. SA-27 SA-14

I would urge the United States Air Force to select the **no action alternative in the Powder River Training Complex DRAFT EIS.** GE-2

Sincerely,

Kathy Muller Ogle

Joshua Simmers

[redacted]

[redacted]

Ms. DeVine,

Please accept my comments to the United States Air Force in opposition to the Powder River MOA expansion into the state of North Dakota. I do not believe that the benefit to the USAF equals the cost to the people of North Dakota. GE-2

It is my belief that the negative impacts on local aviation, commercial aviation, agriculture aviation, the difficulty of coexisting in active MOAs, adverse effects on ranching, establishing our state's FBOs as transcontinental stops, land values, increasing traffic due to our flourishing economy, etc, make this something we should all oppose. SO-7 SO-1 SO-6

Additionally, I think that it is important to highlight that the people of North Dakota have learned from experience to not trust the Air Force due to their *denial* of negative impacts in the past – environmental contamination, low flight, etc., and their over-complicated and under-compensation for reimbursements related to cattle stampeding, etc. GE-5

I ask you to take serious heed of the well laid out arguments put forth by other entities and know that although I support the military, this expansion is not necessary.

October 5, 2010

Dear Ms. DeVine,

I am writing in response to the proposed expansion of training air space and implementation of new flight training techniques. First of all, I appreciate our Air Force members and don't mind seeing the jet trails frequently crisscrossing the expansive blue sky above my home and community. However, the proposed changes concern me. GE-9

The occasional low flying aircraft we see can be disconcerting. They have at times spooked people, cattle, and horses. The occasional sonic booms can be alarming. As I mentioned, these are only "occasional" disturbances. The proposed numbers sound like these could become frequent disturbances. BI-4

In addition, wouldn't an enormous increase in flight training involving interaction between aircraft reenacting combat missions also increase the chance of crashes which would obviously be dangerous to the people below? SA-1

Another concern is the following information, "The planes would drop chaff – very fine strands of silica coated with aluminum that create a cloud-like decoy to hide planes from radar – and lit flares that would burn out before they reach the ground." Can the Air Force guarantee a lit flare will burn out before it reaches dry prairie grass? And what happens if these fine strands collect in areas where cattle or horses could ingest them? How will these decoys affect our birds or other wildlife? SA-5 SA-14

Here is another thought. Why is it military training tactics that would not be considered in, around, or above densely populated areas are considered benign in areas that lack large populations? Are rural residents' lives, environments, or livelihoods not just as important as those of urban Americans? Between the Army's attempts to expand Pinon Canyon and the Air Force's plans over the southwest, it sure seems that the U.S. military doesn't think so. EJ-2

Please report that the citizens of rural Southeast Colorado do not approve of these planned number increases or "drops". GE-2

Sincerely,

Lisa Y. Doherty

10/27/10

To: Linda Devine
Fr: Mike Parnell

Please accept these comments and include them in the formal statements that will be provided to the agencies regarding the PRTC determination.

I object to the PRTC proposal to expand the PRTC airspace and training area proposed during their hearing in Hardin Montana on Friday, Oct 22, 2010. I base this objection on the following and would appreciate your confirmation that these points were received and submitted as part of the Environmental Impact assessment that is to be done.] GE-2

The PRTC did not provide factual evidence for several material claims and in some cases provided false data to support their efforts to expand the PRTC airspace. Specifically:

a. Stated in their testimony and power point presentation that decibel levels would be at or below 100db. In contrast to the Air Forces own data that shows decibel levels of over 150 db at flights above 2000'.] NO-4

b. Stated that the LFE would not have an impact on property values but did not support this statement of fact with any data and in contrast to affected property values related to train tracks, industrial sites, blasting or mining operations and transportation corridors.] SO-1

c. In the PRTC power point and in all of their printed and on line data they describe LFE as only 10 days /year but in reality it can be up to 12 days per year. Based on 20 aircraft this is an impact of 240 sonic boom events if each flight were to only generate 1 complaint or impact per flight.] PN-5

d. Significant impact to penned and free range livestock and wildlife.] BI-4

e. Will not reduce fuel consumption as non military aircraft will have to divert hundreds of miles whenever these proposed areas may be in use.] SO-7

BIG HORN RIVER ◊ MONTANA

1056

f. Current 9,748 sq miles is sufficient! PN-2

g. No provision was provided to create non military corridors thru the vast proposed PRTC airspace, separated by alternate altitudes for different classes of aircraft use. AM-20

The boundaries of this proposed airspace will also affect commerce and quality of life along the Bighorn River, which is one of the most significant economic engines in this area. This fragile Blue Ribbon Trout stream would be affected and a decline in recreational use and investment in these communities would be incurred. SO-9 LU-2

We request that the "No Action" alternative be selected to protect these resources and rights of the residents and visitors that would be adversely affected under the proposed PRTC airspace. GE-2

Respectfully,

Mike Parnell

October 12, 2010

Ms. Linda DeVine
HQ ACC/A7PP
129 Andrews Street, Room 317
Langley AFB, VA 23665-2769

Dear Ms. DeVine

After reading the current version of the proposed expansion of the Powder River Military Operations Area and attending one listening meeting, I still have strong objections to the Air Force's plans to increase the size and use of the Powder River MOA. GE-2

My first objection is the mere size of the area and its effects on the use of the air space by civilian aviation. The capabilities of radar and radio coverage of the area mean that military flights would prohibit civilian aircraft from safely using the area most of the time. While finding out current activity in the area is easy for the average military aircraft, a small aircraft would have to climb far above its routine operating altitudes to be able to reach air traffic advisories by radio. That assumes that the plane would have radio capabilities. Since this is uncontrolled air space. Radios are not required. That would waste the aircraft's fuel at the expense of the privately owned airplane. AM-6 AM-3

The huge footprint of the proposed MOA means that civilian aircraft would, for example, need to deviate many miles out of the way when flying from Rapid City to Billings. That would place them closer to the Big Horn mountains in Wyoming, often a source of turbulence and poor visibility when compared with a direct route. It would also affect the business at civilian airports that are in or border the proposed expanded MOA area. For example, Black Hills Airport at Spearfish, SD would see a vastly diminished use of its airport because of its proximity to the area. In recent years they have aggressively sought to upgrade their facilities to meet the demands of general aviation. That would essentially be wasting the taxpayer money that led to airport's improvements. SA-3 SO-10

The presenters at the hearings claimed that "see and avoid" would be a solution to keeping aircraft separated. The use of night missions without the military using their position lighting immediately makes me think that "see and avoid" is pointless. Since the three air traffic control centers that cover this area cannot give position reports to the surface, a civilian plane would have no way of knowing what was out there. "See and avoid" also has limitations to its usefulness in daylight hours. The closing rate of a military jet with a civilian aircraft cruising at 100 KTS or less, means that the civilian pilot would not have time to react to get out of the way. SA-11 SA-7

The documents in the Environmental Impact Analysis points out that 75 percent of the area in the

1058

proposed area are privately owned land, and not government land. While it is sparsely populated compared with many areas of the United States, it still is used by its occupants for their livelihood. The disruption of their business by keeping the owners from using their aircraft to check on their cattle safely is arrogant by the government. The dropping of chaff and flares over this area creates hazards to those below. The argument that the Air Force would refrain from dropping burning flares during "extreme" fire conditions misses the point of the fire hazard posed by using the flares anytime. At least the new documents provided no longer claim that the Air Force could respond in a timely manner to the prairie and forest fires the flare activity could create.

SO-11
SA-27
SA-5

At the hearing in Rapid City several local business people, who do not own land in the expanded Powder River MOA, gave a business boosters' view of the Air Force's economic importance to the Rapid City economy. I would suggest that they welcome the Air Force to do their training in the air space over Rapid City instead of the Powder River MOA. If they think the Air Force's training mission is so important, they should welcome it being done in the immediate Rapid City area. The planes would not need to spend any fuel to get to their practice area, therefore saving the taxpayers millions of dollars in operational expenses.

SO-24
PN-2

Colonel Taliaferro spent a good deal of his time explaining the use of the B-1 bomber in missions in Afghanistan in which it is used as an aerial platform to observe the enemy and respond to the threats they pose to ground troops. The B-1 was designed as a bomber, not as an observation aircraft. By the time the B-1 came into service at the end of the Cold War it was an aircraft looking for a way to fit into a new paradigm of warfare. I question the economics of using this large, expensive aircraft in its current role. Smaller aircraft, either manned or unmanned, could do the job for a whole lot less expense to the American taxpayer. The military has never been known for its economical use of resources. To me, this is another shining example of abusing the American taxpayer.

PN-6
SO-14

I grew up as the child of an Air Force officer. I have observed the group think of the military for my whole life. The people serving in our services are dedicated to protecting the best interests of America as long as they can keep their job. Historically, Americans have been unwilling to acknowledge the need for a strong military. However, the military and the politicians that send them on their missions, fail to look at the larger view of the needs of America to use it resources wisely. The expansion of the Powder River MOA is a poor choice of using our national resources. The harm this could create is greater than the benefits espoused by the proponents.

PN-3

The citizens of the proposed impacted areas are not the enemy. They need to be treated with respect for their life style and contributions to the well-being of the United States. To question their patriotism because they do not want their life changed dramatically is arrogant on the part of the government and the outside interests that would expand the Powder River MOA.

Sincerely,

Norma J. Kraemer

1059

Nov. 13, 2010

The sudden, unexpected noise will be the biggest negative factor impacting our ranching operation in southeast Big Horn County, Montana. A reliable means of communicating and having the planes detour small areas for a few specified days would be helpful. I believe the biggest negative impact would be during sensitive cattle operations such as branding or shipping, which typically happen in spring or fall. LU-2 AM-12 BI-4

However, we also depend on our military for the protection of our country and the freedoms we enjoy to pursue our lifestyle. I would hate to think that young pilots will be sent on dangerous missions without the skills to attain the high level of expertise needed to execute low-flying combat missions. These skills can only be acquired through hands-on practice. PN-1

In 2008 when my husband was in the Wyoming state legislature, we had the opportunity to visit Elmendorf Air Force Base and learned that the Russians were constantly flying missions to test our air defense borders. The colonel who presented, also a pilot, made some very poignant statements. He emphasized the necessity for large land areas for low flight training so that the young pilots would be able to learn the skills needed to come back safely from missions. I especially remember his plea for this, as his son had volunteered for the Air Force and was currently in flight training.

Penny Ickel

1060

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews Street. Room 337
Langley AFB, VA 23665-2769

Ms. DeVine,

My name is Michael D. Rath. I am an active private pilot, a corporate pilot by profession, and a member of the Lawrence County Airport Board.

I am writing to express my dissatisfaction with the proposed Powder River MOA expansion. I will address how the proposed MOA will effect each of the areas listed above.

As a private pilot I have aircraft based at both Baker, MT (BHK) and Black Hills Airport (SPF). Both airports are located within the proposed MOA. I make the trip from Spearfish to Baker on a regular basis and my concern is that you have not done a impact statement on how this will effect VFR (Visual Flight Rules) traffic through the proposed MOA. The current Powder River MOA is restrictive but it is manageable. However, due to the huge proposed expansion of the MOA it will now be both economically and logistically impossible to circumnavigate the MOA when it is active on a route from Spearfish to Baker. A trip from SPF to BHK is approximately 125 miles. If you wanted to circumnavigate the proposed MOA the trip would increase to approximately 475 miles, making the trip impractical. I know that it is legal to transition the MOA but I feel it is at great risk to myself and my family considering military aircraft in the MOA could be in excess of 500 kts. At night they will be allowed to fly lights out. At those speeds, see and avoid is not an option, it is an accident waiting to happen. This proposed expansion does not give the average private pilot the safe alternative to avoid the proposed MOA.

AM-21

SA-7

As a professional pilot, I am a Captain on the Citation X. This proposed MOA will effect my company and our clients in many ways. First and foremost, the financial impact will be significant. As capable as the Citation X is, it will not be allowed to go under or over certain areas of the proposed MOA when active. Again, the only option will be to go around the MOA. The cost will be borne directly by the company. Next, is the ability to land at an airport that underlies the proposed MOA. If the weather is VFR it would be possible to cancel our IFR (Instrument Flight Rules) flight plan and continue to the airport under VFR flight rules. However, this again would be at great expense to the company. The Citation X burns approximately 300 gallons of fuel an hour at 41000 feet at a speed of 520 knots. In order to fly VFR in the MOA, the highest altitude allowed would be 17,500 feet MSL. At this altitude fuel burn increases to approximately 500 gallons an hour and speed would be significantly reduced. More importantly, we would be putting ourselves and our passengers at great risk because we would be required to see and avoid military traffic. The Citation X has a very capable traffic avoidance system but it would be useless because the military does not use the system. There is also a severe lack of radar coverage through out the proposed MOA. We would be back to see and

SO-7

SA-7

AM-3

1060

avoid but now we would be looking at a closing speed of up to 900+ knots. It is impossible to see and avoid at those speeds! If the weather is below VFR minimums or IFR, VFR would become impossible and there might be no other option but to avoid the airport that underlies the proposed MOA.

AM-3
SA-3

That brings me to my third and final point. As a member of the Lawrence County Airport Board, I can see the impact to the underling airports will be significant. Black Hills Airport with the backing of the FAA, State of South Dakota and Lawrence County will in the coming years invest approximately 17 million dollars into airport improvement. This alone shows the importance the Black Hills Airport has to Spearfish and the surrounding region. It is an insult to the community that Black Hills Airport is not even shown on your maps considering it was ranked #5 out of 34 public use airports in your study! During the time your data was compiled Black Hills Airport's primary runway was closed so it could be lengthened. This was at a cost of approximately 10 million dollars. Your data for the Black Hills Airport is not accurate and should be reevaluated.

SO-10

AM-4

Approximately 80% of our fuel sales are to transient aircraft. With the expansion of the MOA we will see a significant reduction in both VFR and IFR traffic. VFR pilots will avoid the underling airports whether the MOA is active or not because they are afraid of it. Due to the lack of radar coverage in the area, IFR traffic will be significantly impacted when the MOA is active. If pilots feel the Black Hills Airport is a hassle to use because it is located inside the MOA they will just learn to avoid it. The negative effects of the loss of traffic have in no way been accounted for in your impact study.

SO-10

This proposed Powder River MOA Expansion will have far reaching and detrimental effects to many individuals, companies and to the communities in our region. I do not believe that a thorough and comprehensive economic impact statement has been prepared to address these important issues.

SO-22

Sincerely,

Michael D. Rath

Michael D. Rath

1061

10/31/10

Linda Devine,
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB. VA 23665

Dear Sirs,

I would like to comment on the proposed expansion of the Powder River Complex for Air Force training flights out of Ellsworth Air Force Base in South Dakota. The proposed expansion of the training area would be in four states and in an area of southeast Montana which I am very familiar with.

I would like to express my support for these training flights in this remotely populated area as necessary for our pilots and staff in the Air Force and vital to our nation's security. GE-1

I know the low level flights will cause some temporary noise and may startle some livestock but I experienced these low level flights daily for 20 years. Our family ranch in west central North Dakota had daily flyovers by B-52's and small jets from Minot Air Force base. These began in the 1960's and lasted for 20 years. They were low and not without some noise but as kids we were interested to see these large planes flying that low. They came every day at the same time daily and we would wave at them. The small amount of foil they dropped was insignificant. Livestock might be startled and run a short distance but most times paid little attention. In those days jets breaking the sound barrier were a much larger issue and scared people but this will not be the case in this proposal. LU-7 BI-1

If these increased training flights are during the day and as few as proposed they should not be a significant issue. Also this area of SE Montana is being looked at for wind energy development. I do wind testing in this region and there are significant areas of Class 6 and 7 winds which lend themselves to future wind turbine placement. These wind farms would be on the high ridges and plateaus in this area. Future wind turbines would be less than 500 foot of height. This may be considered during this proposal's planning phase. CM-4

Thank you,

Mike Carlson

Langley AFB, VA 23665-2769

RE: Powder River Training Complex

The purpose of this letter is to support the expansion of the Powder River Training Complex. GE-1

Our place is within the current training area. When the training activities are occurring, occasionally planes fly over our place. There has been no observable negative impact on livestock, wildlife, or human occupants due to the noise or physical presence of the aircraft. I do not believe there will be any negative impact if the training area is expanded. LU-7

We also have a home in Rapid City, SD which is located west of Ellsworth Air Force Base about 6 or 7 miles. When the military is conducting training sessions at night we usually clearly hear the aircraft as it lifts off and flies NW of the Base. It is a comforting sound to know that the military personnel are honing their skills; thus, enabling them to be in a better position to protect and defend us in the times ahead. We have the same comforting feeling when the aircraft fly over our Wyoming place whether the aircraft is at low altitude or high altitude. GE-9

To date, I've heard nor read of any objections to the expansion of the Powder River Training Complex that I believe is credible. If the protection of our country will be enhanced by expanding the training area, expand it.

Sincerely,

Dwight F. Moose

Sincerely,

Kathleen N. Moose

WRITTEN COMMENT SHEET
Power River Training Complex

The air force says they need this new area for there training But at who's expense? The air force says lots of thing but most statements are for there benefit and what not to real life, and how it effects us living under the fly zone. SO-14 LV-1

We are worried and scared of what lies ahead of us that live under the fly zone. We have heard that they say one thing and lots of time they do different, and we that live here have to adjust to the situation. Oh they have gotten lots of comments and hearings on the matter, but attending the meetings and hearing you walk away with the feeling that they don't care and that they are going to get there way come high water. GE-5

We have been under the fly zones and they do scare cattle, and people. Especially in the middle of the night some flies over you are awaken out of a good sleep, then it takes for ever to go back to sleep, which is not good for the body. BI-4

The value of our property goes down and if we did want to sell, who would want to buy it {your property} if you lived under a fly zone. SO-1

The increase of the fire danger with them using the flares would increase greatly. They say they would monitor if in a drought area, mainly August. But we can have a drought season from June----September. SA-5

The speed the flares fall to the ground is unreal, up to 100 mph, and if they don't ignite and hit a person are any kind of livestock, or even wild life it would not be good. And this is acknowleded in the Air Force impact statement. SA-14

Even in there impact statement they say the dud flares are rare, but extremely dangerous. So why take a chance. Then they say if you fine a dud flare you have to call them and they will take care of it. Who has the time for all of this.

Also they can deploy chaff, and the inch long aluminum coated silica and these tiny fiber strands drift to earth and get into our stream, lakes,water tanks, in our grasses and our hay and we feed our livestock , .WE ALL KNOW THAT ALUMINUM CAUSES ALL TIMERS. AND THE TINY FIBERS COATED WITH SILICA CAUSES CANCER. We know what you folks think that it will not happen and it's not a danger to us, livetstock or the eviroment. We don't want to take the chance on this our life is important to us and our families. SA-14

What you folks are planning to do is destroying a way of life in the small rural towns and areas. and we don't like that, LV-1

Our airports will be in trouble, and there are comments that out of the area, state fliers will not come to here and have to cope with your low flying planes. Our medical air lift SO-10 SO-5

Pg 1

Nov 11 10 07:22p 1063 p.3

has said the same thing, so now you are endangering our lives, because we can not be air lifted out of here. I don't think we should be put in this kind of situation. SO-5 SA-19

Our little towns are having trouble staying afloat now, and this will just cause an other hardship upon us all.

There have been things that the EIS did not make any comment concerns on what the conception rate{rebreeding } of livestock and wild life would be, also the concern of the contamination of the sheep's wool by filaments{cancer causing agent in the chaff}. Again our lively hood is at stake. SO-13 SO-16

We that opposes this expansion is said to be non-patriotic which would not be the truth. We support our troops and there efforts, but not at our expense of our lively hood.
Facts we have learned: B-1 was developed as a long-range super-sonic bomber with low-level capabilities, but why does it have to tested at 500 ft.
The B-1 top speed is 830 mph,----13.84 miles per minute----1218 feet per second---4 seconds per mile.

THIS MOA BELONGS IN THE DESERTS OR OVER OPEN-WATER NOT WHERE THERE ARE PEOPLE, FARMES, RANCHES SMALL TOWN, AIRPLANES, AND VALUAVLE RRESOURCES. WE ARE IMPORTANT TO. PN-2

WE HAVE BECOME A TARGET FOR EVERYTHING THAT NOT GOOD
WE SUGGEST NO-ACTION ALTERNATIVE GE-2

November 8, 2010

Ms. Linda Devine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Ms. Devine,
I am writing to submit my comment on the proposed Powder River Training issue. Several years back, I submitted comment adamantly against this, as did several area residents of our state and neighboring states. I was disgusted that this went forward anyway. Virtually every person in the proposed area has voiced serious concerns over this issue, and it seems they have been largely ignored. Since this seems to be protocol, I will keep this short and not go into deep explanation as to why this should not and can not happen in this country to people who have so vehemently spoken out against it. Yes, we are fewer in numbers than some areas, but we are still citizens of this country. We have the undeniable right to protect our land, our health, our livelihoods, and our future generations from this kind of ridiculous experiment. NP-1

What you are proposing would be preposterous to people of any other area of the country, and it simply would not stand. I understand the need for training. I support our military. But we all know that future wars will not be fought in the air. They will be fought in and amongst the citizens. To train for this at the expense of United States citizens is appalling. An alternative to using real human "dummies" on the receiving end of this would perhaps to be using technology to simulate training. We can send astronauts to the moon, fly airplanes, and experience disasters via simulation. I find it hard to believe we cannot adequately train our fighter pilots to perform their duties through similar methods. If this is not possible, then go "train" where you are going to fight. There are adequate areas that are unpopulated and will give a more realistic picture of real-life scenarios in the landscape of your proposed war scenes. Leave us out of it. GE-3 PN-7 PN-2

Why should we have to risk our health, our safety, our lifestyle, and virtually every aspect that makes this area precious to us for your benefit? Does not the voice of the people outweigh the outcome? It most certainly should, and shame on whoever decides that we are not important enough to protect. We are feeding your country, Ma'am. Respect it. We are raising your future leaders. Respect it. We are contributing to the success of our country to sustain itself. Respect it. To do otherwise is the most horrendous insult to the very foundation of the United States of America. You have not heard one positive comment that would come as a result of this proposed air space usage. I strongly urge you to LISTEN. NP-1

Respectfully submitted,
Phillip + Lori Rusley

I STRONGLY OBJECT TO THE AIRFORCE GETTING THE AIRSPACE OVER BAKER MONTANA DESIGNATED MOA. SMALL COMMUNITIES IN MONTANA LIKE BAKER STRUGGL FOR ECONOMIC SURVIVAL THIS WOULD HAVE GREAT NEGATIVE IMPACT TO THAT ECONOMY. IF THIS ISSUE WERE PUT TO A VOTE BY THE CITIZENS OF MONTANA, IT WOULD NOT PASS. GE-2 SO-9

MOA'S NEED TO BE LOCATED OVER UNPOPULATED AREAS SUCH AS DESERTS OR OCEANS, NOT POPULATED AREAS, NOT EVEN SPARSELY POPULATED AREAS. PN-2

GENERAL AVIATION WOULD BE SEVERLY RESTRICTED. I WILL NOT FEEL AS SAFE FLYING VFR IN A MOA WHERE SUPERSONIC TRAINING IS TAKING PLACE. WE NEED TO CLOSE SOME OF OUR NON PRODUCTIVE MILITARY AIR BASES LIKE ELSWORTH, NOT EXPAND THEM. SA-7 GE-2

Subject: Powder River MOA Proposed Expansion

Dear Ms Levine, I am a private pilot and airplane owner based at Black Hills, Clyde Ice Field (SPF). I have recently become aware of the proposed expansion to the Powder River MOA and find it very disturbing for the following reasons:

- According to your Environmental Impact Statement (EIS) SPF will now be included in the Powder River MOA Gateway.
- According to your EIS, the MOA will be active four and one half days per week from 500ft to 60,000ft. PN-5
- According to your EIS, B1 Bombers will be flying low level sorties at 580 knots. "See and Avoid" does not work at those speeds and you have completely shut down my ability to fly when the MOA is "hot". SA-7
- Further more, IFR operations will be shut down when the MOA is "hot" over an area of 37,800 square miles. This seems unreasonable. AM-6
- Exemption #7960C indicates night operations will be conducted "lights off" for night vision goggle training. Again, this shuts down my ability to fly at night. SA-11

The proposed MOA expansion will severely limit my ability to fly. Please reconsider this expansion of the Powder River MOA.

Roy E Kimbell

1067

Sept. 10, 2010

Linda DeVine,
Program Manager ACC/A7PS,
129 Andrews St., Suite 337,
Langley AFB, VA 23665.

The published summaries of the proposed North Dakota Air Force Bombing range do not discuss or list all of the many alternative restricted air space already available for performing such operations.

AM-9

There is already way to much restricted airspace. Please use an existing restricting airspace for any practice bombing operations and stop trying to spread bombing practice along navigable airspace which restricts commerce; patently unlawful.

AM-11
PN-2

This unlawful proposal will only generate law suits if you persist with it.

Rec'd Sep 30, 2010

1068

Ms. Linda DeVine: 29 September 2010

I attended the Powder River hearing in Elgin, ND on September 23rd. I would like to submit the following comments.

(1) I was surprised that no questions were permitted. I believe they should have been, as they can or could have, provided answers and insight into the topic at hand. NP-2

(2) Regarding the use of "flares"; I remind you of the recent large fire in Utah, started at a military training facility by the National Guard during a live fire exercise. The "Commander" in charge, stated he did not know about the extreme fire hazard. Fire conditions in this part of the country, can and do change frequently. I would question the prudence of using "flares" and suggest that you remember "Murphy's Law"; if something can go wrong, it will. I would like to know, how the Air Force would do a better job of "Fire-Watch", if you will, than "ground based forces". I, for one, believe fires will/would be an issue. SA-5

(3) I see this expanded "Air Space", as one of convenience and not really needed. We already have the Nellis AFB and the Indian Springs AFB along with the large military restricted area, just NW of Las Vegas, Nevada. Our current President, The "Commander-in-Chief", has stated he will begin pulling troops out of Afghanistan by July of 2011. There was a comment made by one of the officers, that they need this added space for training as it relates to Afghanistan. The mountains in Nevada make this a better option and besides, the "missions" in a year, will be changing or diminished. We as a nation, cannot and should not, continue to engage in "un-funded" wars. This request for added/expanded space to train for bombing missions seems weak at best. PN-2

(4)It would have been nice to know who conducted the "studies" and where they were conducted, regarding information presented on safety, noise levels, physical and biological reactions, affects on structures, etc. Since no questions were permitted, those remain unanswered. I have lived through and experienced B-52 bombing missions and have no desire to go through that again. The noise and vibrations that the air craft produce are incredible. GE-13

(5) This much expanded airspace for training, would also affect the local air ports, crop dusters, pilots who seed clouds, live stock and our way of life. There are already two training spaces near Devils Lake and another I believe, scheduled for Grand Forks Air Base. SO-10 SO-2 PN-2

(6) Last but not least, do our comments carry any weight or has the decision to go ahead already been made; that is the question, one would like to have asked at the meeting. NP-1

Respectfully,

Upton F. Becker

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews St. Room 337
Langley AFB, VA 23665-2769

September 14, 2010

Dear Ms. DeVine:

I am an enthusiastic supporter of the proposed expansion of the Powder River Training Complex. GE-1

I spoke at the public meeting in Rapid City this evening. I am writing this letter to expand upon the remarks I made during the meeting.

I am a Veteran of the uniformed services. I served from 1970 to 1972.

I have been a property owner in this region for about 14 years. I have owned property in Keystone, Custer, and Rapid City, all of which are in South Dakota. I have lived here for seven years.

I live under the flight path of some of the aircraft that fly out of Ellsworth AFB. I do not find their noise to be disturbing. The deer, turkeys, horses, and other animals here seem to be able to live with the noise of the B1-B bombers. BI-1

I lived in France during the summer of 2010. In France, 60 million people are packed into a space the size of Texas. There are rural areas, like the small village where I lived. However, there are no "wide open spaces" like we have in the Great Plains of the US. But France wants to have a military. They need to train. So their jets fly over the rural areas. A couple of times a week, a fighter aircraft would fly over our village. The noise was a distraction, but not an inconvenience. People were accustomed to it. The chickens seemed to be able to lay eggs. The cows made milk that was made into superb cheese. In other words, the people and livestock were living with the occasional noise from the jet aircraft. BI-1

My professional training has been in environmental engineering and environmental law. I spent much of my career in work related to environmental impact assessment. I am not professionally

1069

involved in your project. Based on my professional background, it appears that the Air Force is doing a pretty good job of responding to people's concerns.

Several of the speakers at the public meeting expressed concerns about compensation. The format of the meeting did not provide an opportunity for the Air Force to respond, so I do not understand what the Air Force plans to do about the issue of compensation. Let me respond from my background as an environmental lawyer. I believe the expansion of the Training Complex constitutes a "partial taking" of people's land. Although the Air Force may need to use this air space for some years, this taking is not likely to be permanent. Therefore, on a temporary basis, I believe people will suffer reduced property valuations and reduced opportunities to make the best use of their land. In turn, the Air Force should compensate them on an annual basis, like an oil lease or easement. SO-1

Let me tell you a story about compensation which may shed some light on the challenges faced by land owners and the Air Force. I recall a situation from my youth when the Maryland State Roads Commission dramatically widened the road in front of our house. Aside from taking some of our land, they raised the level of the road. Our house became "buried" on two sides, so the noise level was much higher, the house was vibrating, and people in passing cars and trucks were looking down into our house. Moreover, our ability to enjoy the house was significantly reduced. The State of Maryland recognized this reality. Consequently, in addition to the $3000 that they paid us for the land that they took, they also paid us $3000 in "proximity damages." We felt that was a fair way to handle the situation. We continued to live there for two more years until we could pull together enough money to move to a house in a quieter neighborhood.

In conclusion, assuming the Air Force can create a satisfactory compensation scheme, I am an enthusiastic supporter of the proposal.

Sincerely,

1070

My concern with the Powder River Training Complex will be sharing airspace with large, low altitude, fast moving military aircraft. I own a ranch within the proposed complex and use a small relatively slow moving airplane for ranching operations. Most of my flying is done early in the morning, at low altitudes and VFR. Since VFR is see-and-avoid, my concern is see-and-avoid with high speed military aircraft at low altitudes.

SA-7

If I knew when the MOA was active, most of the time I could adjust my flying to avoid the MOA. The EIS in Table 2-10 lists the Time of Use Monday thru Thursday 7:30 – 12:00 L etc. and other times by NOTAM. What would benefit me the most would be a way to find out when military aircraft are actually scheduled to be in the MOA. A phone number or preferably a website that I could access before I flew that listed which MOA and the time military aircraft are actually scheduled to be flying. For example, if I knew that military aircraft were going to be in the PR-2 MOA from 8:30 – 11:30 on a particular day I wanted to fly, I could avoid the MOA at that time. This information would need to be updated daily several hours before the departure of the military aircraft. Sections 2.2.1.3.1 thru 2.2.1.3.4 indicate there is plenty of planning time before takeoff to do this.

A website could also be used to inform when the LFE's are scheduled. I don't know how the LFE's will affect my ranching operations, hopefully not. But if there is a negative aspect, I might be able to schedule some of my operations on a different day. The earlier I know about the LFE schedule, the better. And I am sure there is plenty of planning time to allow this.

AM-12

The more current information I have access to, the better I will be able to mitigate any adverse impacts the proposed training complex will have on my operation. Thank you

Glenn Gay

areas. The wind vortices from a B1 can extend to 900 feet when flying at 500 feet they can displace chemicals being applied. This could injure susceptible crops to injury and cause a liability issue. SO-2

The prime time for application is in the morning when temperature is low as well as calmer wind. Evening application is harder because of temperature inversions. AM-12

Calling Air Force personal to find out when they are flying is not an option.

3) Air Quality

Our air is not as good now as the Air Force would like us to believe because of [redacted] training now.

The increase in use of the expanded training area will greatly increase air pollution. The only sampling area used by the present training area that is located anywhere near is on the Crow Reservation in Montana. AQ-3

Increases in emission's as follows

Voc (fossil fuel)	1800%	increase
CO	721%	"
SOx	682%	"
NOx	692%	"
PM10-PM25	978%	"

These are increases in emissions, which is to say we are not being told about how much the area is going to be used over what it is now.

4) Land Values

Land values will be decreased by noise + air pollution as well. People will be not be interested in purchasing a house or property in this area. SO-1

This will put a tremendous burden on Local governments because of the decreased values SO-3

This expansion is not needed for the training for the simple reason all the other planes will have to use the fuel to get here. PN-2

If this is to proceed landowners + homeowners need to be compensated. I did not volunteer to give my land to the Air Force for any reason. SO-1

JF

September 20, 2010

Concerning the "Powder River Training Complex" expansion:

It seems your request for an expansion is the norm for all of our government these days. In this particular case it is an attack on where we live and goes to the heart of our only weakness -- low population. But, as you can see by the attendance at these hearings, these few people not yet relegated to the cities, possess a big voice and an even bigger reason to protest your expansion. We grow weary of attending meetings where we express our concerns to some faceless bureaucracy, only to hear later that our concerns were for naught and plans will go ahead. NP-1

We that remain here value highly these expanses of relative peace and solitude where we accept the howl of winter storms and the roar of summer gales. Now you come to tell us you want to introduce the roar of Bomber jet engines and the afterburners of your fighters. To this request we give a resounding "NO". The only shadows we want to see over our lands are those of clouds and soaring hawks and eagles. LU-2

We stand by our County resolutions and will consider any expansion of flights, at the very least, an intrusion of our autonomy as citizens of these said States and Counties. We wish to continue as our Forefathers -- raising our children and grand-children, calving and lambing in their seasons and working the land, free of any further encroachments. For if there was only one of us left in the whole area and hewas against this expansion, that would be cause enough for you to abandon your memorandums. We believe the freedom of our country and the preservation of our Constitution hinges on these principles alone. Not on the expansion of the "Powder River Training Complex." LU-3

I am Sincerely,

Dennis R. Drayton

September 23, 2010

Concerning the Powder River Training Complex Expansion:

After scoping the Air Force's in depth study of the environmental impacts, they have considered all the aspects and most of the time come to the conclusions, as we have, that the whole plan , if implemented, will damage fences and corrals, disband sheep, make riding horses more risky, startle us, shake our homes and contribute in-general to a more stressful life for all. This is all a given. But, let us be clear, there is much more than the environment at stake. As my good friend and neighbor, Shawn Weissaar, said after looking at the map, "this is nothing, if not a "taking", clear and simple.

Well, ladies and gentlemen, he has hit the nail on the head. We are all here because we are property owners. And, as American citizens, we are endowed with certain inalienable rights ,of life, liberty and the pursuit of happiness. That includes the rights to what happens on or over our land. Even to the point of who we allow to enter. The land and skys above are a gift from our Maker and we thank him for the bounty it provides and for the peace and tranquility it adds to the lives of our families.

LU-1

All of our lands are historically important, having been trod on by the earliest man and animals to the present time. None are more important than what we personally own regardless of the lists that have been made. Now the governmant has parlied with the various tribes and found that the representatives all voiced their opposition to their inclusion in an expanded training complex. The Air Force has seeminly agreed that on certain circumstances they would try to avoid tribal life and activities. All the time being mindful of the impoverished children thereon. In contrast we other citizens of these areas come in even greater numbers to voice our opposition, while those we elect to Congress abandon us and essentially offer up our lands as sacrifice in the interest of keeping the air bases open. It's as simple as that.

EJ-1

So, don't spend too much time conferring with these representatives because they are not here to offer sympathy nor do they owe us any allegience in this matter. We must focus our efforts in making our congressmen and women accountable to our wishes.

NP-2

2nd comment period:

Did you notice that these representatives of the Air Force and other entities have brought no goods to trade with us, no offers of compensation or recompension. Remember, all the trading was done before they arrived here by the cooperating agencies and those whom we trusted to act in our best interests. All the federal agencies arrayed against us play nice with each other and hard ball with us.

SO-1

If we cannot prevail in this issue, if our voices and desires are not heeded, a black curtain will have been dropped over the faces at Mount Rushmore. Will we, just as the Lakota the Crow and the Cheyene before us, be left to cry a trail of tears? We will see, we will see.

Public Hearing for Powder River MOA Expansion:

I will be attending the EIS hearing at Miles Community College on October 15, 2010 to oppose the expansion of the Powder River Military Operations Area for the same reasons expressed in the attached letter from Scott Newpower. I am a local pilot that frequently flies within the proposed area of expansion to do my work as an insurance adjuster. I am also the chairman of the Miles City Airport Commission and am opposed to the expansion on the grounds that this will greatly diminish the traffic and, therefore, revenue for the Miles City Airport. Thank you for any help you can provide in helping us preserve the air space we currently enjoy using. SO-10

Langley AFB, VA 23665-2769

Dear Ms. DeVine:

On Table3.7-4, Ghost Towns Under proposed PRTC Airspace, you list Whitewood, SD as a ghost town. Whitewood, SD is a thriving small town with over 800 citizens of the Sovereign State of South Dakota. The question I would liked answered is this a reflection of the accuracy, of the draft environmental statement for the proposed PRTC or a look into the future of what the USAF plans for the area? CV-1

President Ronald Reagan signed executive order 12630 which said even a partial loss of property rights was a taking that should be compensated for. Why does executive order 12630 not apply to the PRTC since private property owners will suffer economic loss, social loss and possible loss of health or life through the startle effect?? As you know scaring to death is a crime SO-1

President Obama signed an executive order giving diplomatic immunity to Interpol, since there are at least fifteen nations that have fighter planes stationed in the United States, if a foreign pilot shoots up a school, like a national guard pilot did in New Jersey or some other structure or citizen of one of the Sovereign States of South Dakota, North Dakota, Montana or Wyoming will the foreign pilot be given diplomatic immunity?? What will be the response of the USAF when one of their pilots does an unauthorized show of force against a rural citizen of any sovereign State, Commonwealth or Republic of the United States?? Reference is made to the 17,000 acre Warren Grove fire started by a flare in an unauthorized show of force by a plane of the DOD of the United States. SA-17 SA-5

Why are the sounds of the B1B bomber put into dbl DNL when the Air Forces' own litetiture state that the B-1 sounds are not in dbl?? By averaging the noise level and the frequency of the pollution from the training as this is, it like averaging the impact of a bullet from 50 caliber gun. If averaged over the probability of a USAF fighter shooting a citizen in the MOA, say once in every 500 years, then the bullet would harmlessly bounce off. Thus all noise levels and sonic booms should always be in the maximum exposure. How does the USAF propose to keep the sonic booms inside the MOA boundaries?? NO-4

The draft EIS does not address the fact that wind energy development in the proposed PRTC will come to a stop, because of a lack of liability insurance SO-17

1082

availability in a MOA. How does the USAF propose to compensate the counties for the loss of property tax revenue?? SO-3

In comparing the "Life Cycle of Chaff and Flares" presented at the scoping meetings it states "In rare cases of fire Ellsworth AFB and local agencies would rapidly respond." In the draft EIS the information has been changed to "The Life Cycle of Dispensing Chaff and Flares" but the very troubling change is " In extremely rare cases of fire, local agencies would respond and notify Ellsworth AFB PA." Does this mean that the AF is not a good neighbor, as a good neighbor would quickly go to the aid of a neighbor especially if they had started the fire. It appears that the AF sees itself above the very people it says it is going to protect. SA-6

George Stone, airspace manager at Ellsworth in a Rapid City Journal article acknowledges that more planes will likely be using the complex after it is expanded, while in another article Col. Jeff Taliaferro says "While the size of the air space is going to increase the amount of traffic isn't. Does this mean that there will be more different plans that fly less or does the left hand not know what the right hand is saying??? Living a quite life under the flight path to and from the proposed MOA I am very concerned about my health, livelihood and the survivability of the eggs of the wild birds. As I am sure the information was inadvertently omitted concerning the vibration that B-1has on the survival of fertilized eggs. AM-2 SA-22 BI-2

This draft does not address the impact the increase air traffic will have on the citizens of the Sovereign State of South Dakota that are in the path of the planes coming and going day and night in a LFE which the GAO has said are a waste of money and disorganized. What makes the AF smarter than the GAO?? LU-2

Best Regards
Allen Olson

September 28, 2010

Ms. Linda Devine
HQ ACC/A7PS,
129 Andrews St,
Langley AFB, VA 23665-2769

Dear Ms. Devine,

I am Anita Lee, I have lived on this farm with my husband Kenny for 41 years. I would like to explain what air space means to us.

We raise wheat, alfalfa, sunflowers, and millet. Starting the first of September, Kenny, and our son Rick, will spray all of the ground that is to be planted to winter wheat. They usually use ground sprayers with Roundup (name of chemical). Ground sprayers are self-propelled, or pulled by tractors and roll on the ground. Ground rigs are safer than spraying with air planes but they still have to watch weather conditions very carefully. The wind must be from the right direction to protect neighboring fields, trees and pastures, and not be over 20 miles per hour. The temperature must be between 50 and 85 degrees. In South Dakota, this is a challenge. The spraying is almost all done between 5 am and noon. By noon, the wind is usually too strong and sometimes the temperature is too high. Also, they must have several hours before a rain, so the chemical can be absorbed before it washes off. If the ground is muddy, they must hire a 'crop duster', which means a spray plane.

In this area, winter wheat should be planted between September 10th, and the end of October. The ground must be sprayed before the wheat is planted to kill the weeds. If it is not sprayed, the weeds will take all the moisture and the wheat will not come up. They can't spray the weeds after planting because Roundup will kill the little wheat plants. They plant about 2500 acres of winter wheat and it is always a grueling task to get it all done on time. Any day that they can't spray adds to the stress. Wheat must be planted by the end of October to qualify for crop insurance. Crop insurance is necessary for our financial security and peace of mind. Also, most lenders will not loan money to operate on if the farmer doesn't have insurance. (They want to be sure of getting their money back.) If wheat is planted earlier, there is more damage from grass hoppers and crop diseases. Since winter wheat is the biggest and best crop for this area, we need our air space from September 1st till October 31st.

Obviously a jet will not hit a ground rig and kill the pilot, but wing vortices can move the chemical to the neighboring field or trees. Since any spraying operation must avoid wind over 20 mph, a passing plane would disperse the chemical onto the wrong field and kill alfalfa, grass, etc. This would be like having a low flying jet pass over a car being painted. Suddenly, your beautiful red paint is all over your neighbors' cars, houses, windows, etc. Chemicals can't be 'removed' like paint.

SO-2

1083

September 28, 2010

International regulations require commercial airlines to be separated by 6 nautical miles to protect them from wing vortice interference. This is conservative since research has shown that wing vortices move about 90 knots per hour and remain about 10 miles behind the plane. **Small aircraft are supposed to stay at least 1000 feet below other aircraft.** Vortices stay longer in calm winds and dissipate faster in higher winds. Ag sprayers only work in calm to light wind conditions. Since the Air Force claims to be flying at 500 feet AGL, (and current residents of the Powder River MOA say it is more like 100 feet), clearly the wind vortices will be a problem for agricultural chemical application.

SA-7

From October till January the calves will be weaned and confined. Since the Air Force has already promised not to fly over us when these activities are taking place, we will not go into that. I think everyone understands the danger to humans and animals when they are confined and spooked by low-flying aircraft. Calving and lambing runs from January through June. Since the Air Force has promised not to fly over us then, I will not go into the even greater threat to animals and humans when animals are spooked at calving and lambing time.

BI-4

April brings us to the time when the winter wheat must be sprayed to kill the spring weeds. This is the most difficult spraying operation, and when many farmers who usually use ground rigs have to call crop dusters. This is the time when spring rains often make the fields too muddy to drive through. There is about a 2-week window when this has to be done. If it is sprayed too early, weeds will sprout up after spraying and choke out the wheat. If it is prayed too late, the wheat will be damaged. This time span is sometime in April through May. It varies with the maturity of each field. This varies because of planting time, weather, location, etc. If it is not done, the crop will be poor, or lost completely. We need our air space in April and May.

April through June brings us the completion of calving, and branding time. Branding takes a long time because each rancher picks his own days, reschedules for rain, days he helps his neighbors brand, etc. Since The Air Force has promised to avoid us during this time, we won't go into that.

April through June also brings the chemical application for the spring crops (spring wheat, corn, millet, sunflowers, safflower, oats, etc.) This is just like the fall spraying for winter wheat.

Some years, because of extra rainfall, the winter wheat must be sprayed again before harvest. This is usually done with a plane, so that the mature heads are not knocked off the wheat. This is done in July and August. Sunflowers are also sprayed in the late summer to kill insects. Sunflowers must be sprayed by air because they are too tall for a ground sprayer.

Alfalfa can be sprayed from April through September to kill insects. This brings us around to September again when we start spraying the winter wheat ground. Farmers spend as much time on their spray rigs as ranchers spend on their horses.

The north west corner of South Dakota raises 5 to 7 million bushels of winter wheat a year. This is a million loaves of bread a day. North Dakota raises more wheat than South Dakota. This doesn't count all the other crops. Cattle is the number one commodity to come from this corner of the state. The average farmer puts about $200,000 a year into the local economy and pays about $20,000 in state and local taxes. There are about 3,500 farms in this corner of South Dakota. My numbers only apply to the north west corner of South Dakota, covered by this training area. I do not have the Agricultural Statistics books from the other three states, so I left them out.

SO-2

This is a little idea of the number of people in the world who will go hungry if you take our air space. I hope you plan to reimburse us for our lost income and reimburse the state, counties and cities for the lost tax revenue and sales.

SO-12

1083

September 28, 2010

You may think this is more important than making 12 to 24 B-1s travel to Nevada to train, but I hope you understand that we DO NOT.

Another concern is the way damage claims are handled. I have spent some time studying how damage claims are handled in other MOAs and I have found they they are usually not handled. The EIS stated several times that claims would be handled out of the Ellsworth Public Affairs Office, and gives a phone number. I dialed that number to see what happened. I got an answering machine. I gave my home and cell phone number and requested a call back. That was 4 weeks ago and I have still not received my call. That is about the way other MOAs handle claims, according to the reports I have read. At the EIS meetings, the Air Force speakers talk about how few damage claims they receive. I can certainly believe that. They don't pay claims, so people just give up.

GE-8

Crop damage, like I described above is not covered by any type of private insurance. This is another reason that we **can not farm in a MOA**. A fair way to handle claims is to turn them over to local authorities. Whether it be the Sheriff, County Commission, or a special board, they should be accountable to an elected County official. If, as the Air Force claims, there will be no damage, this should not be a problem. If there is a problem, the fifth amendment says "*nor shall private property be taken without just compensation.*"

SO-12

Thank you!

Ms Linda DeVine
HQ ACC/A7PS
129 Andrews Street Room 337
Langley AFB VA 23665-2769

Dear Ms DeVine:

This letter is a follow up to my letter of July 31, 2008. I continue to be adamantly opposed to the Proposed Powder River Complex expansion. The Air Force may think this is desolate country but it is not! This area is one of the most productive areas in the State of Wyoming. GE-2

Having experienced low level fly overs, it would definitely affect my cow/calf operations, not to mention the huge abundance of wildlife in the area. Specifically, low flying aircraft, sonic boom disruptions, and the use of chaffs and flares will be a significant disruption/disturbance to my livestock, myself, and the wildlife on my ranch. Stress caused by this disruption from your training flights would decrease my breed back rate nearly 40% (documented by cases in Nevada). This would devastate my ranching livelihood! In addition, the wildlife and their reproduction would also suffer! SO-13

Chaffs and flares also being used during your night training will potentially cause large scale brush/grass fires. Your draft EIS might not have taken into account that in this portion of northwestern Wyoming we are not afforded the luxuries of fire equipment and personnel at every corner. We are ranchers and, therefore, depend on ourselves, our neighbors, and our local volunteer fire departments! In this area of Wyoming a small brush fire caused by one of your flares can get out of hand in a minutes time and devastate thousands of productive acres! SA-5 SA-6

I live and ranch in Crook County, Wyoming, which is within your proposed training expansion. This proposal would definitely and significantly devalue my property and livelihood. This would destroy any hope for future profits and retirement and, is certainly not the American Way! SO-1

1084

Perhaps the Air Force should use some land in a desert area or other non-productive land owned by the Government.] PN-2

Thanks for your consideration and understanding of the impact to our lives and our livelihood with this proposed expansion!

Sincerely,

Antone Swanda

12 Nov. 2010

TO WHOM IT MAY CONCERN:

This letter is to express my opposition to the Powder River MOA Expansion. My interest in this matter comes from my back ground as a cattle ranch owner, Pilot, Chairman of the Montana Community Airport Association and citizen of Montana. I testified in both of the hearings at Colstrip Montana and do to the constraints of the system it was impossible to make it clear on all the things that you are mis-representing with inaccurate assumptions. Your input of what you consider important without consideration for the view and needs of others is shocking. Your grasp for this huge amount of airspace is unjustified considering what you actually require. I have been following this expansion proposal for a number of years and there is no need to reiterate the issues that you continue to cast aside as unimportant or negligible from your view point. You do not seem to understand the tremendous impact that you are creating upon our environment and economic lively hood here in Montana. Your disregard of personal property rights concerns me. You have come here with a presentation that is bias in nature to request far more airspace than you need and then try to hood wink the American public into thinking they are less than patriotic if they disagree with you. This behavior is far less than the standard that I would expect from our Armed Forces and Government. I think you have forgotten who and what you represent. With your less than honest presentation I am confident that the people of Montana can demonstrate that your requests for this huge airspace grab is unjustified. I'm convinced that this much airspace is not required for the training of our military at the level that you are suggesting. Rest assured that if you do not reconsider down sizing the magnitude of this expansion that you will bring resistance from all of Montana that will certainly cause you grief in this or any future expansion that you might attempt to justify. You are damaging your credibility with these kinds of presentations. The American public is fed up with this kind of power policies and I suggest that you begin here by reconsidering to down size this Powder River MOA expansion.

Public Hearing for the Proposed Powder River Training Complex

Thank you for your input!

DATE: Nov 6, 2010

PLEASE PRINT

I attended the meeting on the Powder River training Complex held in Ekalaka in 2008 and 2010.
We are still not convinced this is a good idea.
I wrote you before the first EIS came out. We received a copy of it and could hardly get it all read, and understood!
My Son and husband both fly. Our airstrip is just down the valley from Ekalaka. We feel these air Force planes would hinder our flying to check livestock, fences and water.
According to the maps. your Planes would be Flying (over) SO-11

Over Ekalaka and our airstrip. It would be a great inconvenience to have to call the Air Force when we need to check livestock in a hurry.

There are many ranchers, and other people who fly in Carter County, I'm sure it would inconvenience them also. SA-5

We are also afraid of Fires From the flares and the chaff would Pollute the landscape. SA-27

We're also afraid the Sonic Booms would Scare the livestock. BI-4

Let it be noted: We are against this proposed expansion of the Powder River Military Operations area. GE-2

We feel this is another Government "Takings" !! SO-1

My comment regarding to the Air Force Environmental Impact Statement for the Powder River Training Complex that was held on Wednesday, September 15th, 2010 at Belle Fourche Area Community Center, Belle Fourche, SD:

The aircraft, such as the B1's and the B52's, the Air Force need to fly their missions to prepare protection for our country. We, Bill and Ruth Rosencranz are willing to let the Air Force fly over our land/ranch at anytime; we need them in the air, to protect us from foreign abroad.

GE-9

1087

SOARING THROUGH THE SKIES

The beautiful, clear, light blue southeastern Montana Skies
Grace the rolling and grassy plains below.
The animals roam with beauty,
And feed from the weathered prairies they know.

The gracious birds soar through the air,
And their companions come there to meet.
With the welcoming sight of the fast moving B-1 bomber,
Fulfilling this fresh air, with its greeting mission in flight.

Their whooshing sound that is often heard,
When quiet moments are greeting our mind.
Alerts us that our visitors have again returned,
And with a quick look, you might find.

One mid-September afternoon,
When area ranchers were involved in the basic fall chores.
A mushroom of smoke bellowed upon the sky,
And brought immediate fear into their eyes.

They rushed to their nearest equipment and phones,
And quickly, raced over the rolling plains.
To view this frightful and overwhelming event,
Of an unexpected B-1 bomber plane.

This devastating time in their lives,
Brought immediate and emergency attention to those near and far.
With love ones losing their main stay in life,
This day will never be forgotten where ever we are.

While the four men aboard perished into heaven above,
Leaving their love ones, and friends behind.
Our hearts with special and caring thoughts,
Honor these dedicated men who will never leave our minds.

Ruth Rosencranz

I am in favor of expanding the Powder River MOA. GE-1
As an active pilot I feel we deserve a method
of notification when the airspace is active. I would be AM-12
in favor of a web site that would be real time
and would give a fair advanced notification. A [redacted]tw
hour notification would be adequate. Another option
that could work would be a beacon that is AM-8
installed in an aircraft. The Military aircrafts could
have a reciever to pick up the signals. Just my
thoughts. Have a good day.

Langley AFB, VA 23665-2769

Dear Ms. DeVine,

The proposed Powder River Training Complex flight area over North Dakota will occupy airspace I use most often while I pilot my Cessna 172, N 171VA. I fly out of Mandan ND for pure enjoyment in 171VA which is a 1979 aircraft I learned to fly in when I turned 60 years of age. This vintage and many of the 60 aircraft home based at our Mandan airport, Y19 have concerns sharing the skies with a computer pilot in the left seat while we have only basic equipment in our aircraft.

The way I understand the situation a (PRTC) training mission maybe activated at a moments notice which may make one of us violate unknowingly the airspace we are so comfortable in at the present time. The additional activity of low very big very fast aircraft may put one of us in jeopardy of loosing life limb or license. Please find a neighborhood less interested in what is going on in their airspace than your friends in Mandan, ND that love our skies just the way it is today and want to keep it that way.

AM-12

a pilot since 1978 flying a Piper Cub. I can say I have been closer than I felt comfortable but never was close to a problem and have not decreased my flying time due to military air traffic. I was one of the first volunteer firefighters to respond to the one B1 wreck in this area but considering the number of hours + flights that the air force has flown the safety rating must be very high. I am all for the expansion and look forward to seeing some different aircraft. I only wish they could stop and give me a ride. I also glad it is our military flying over and not someone else. GE-1

Thank You for the opportunity to respond

1093

Ms. Linda DeVine
Program Manager ACC/A7PS

I oppose the expansion of the Powder River Airspace. Aside from interfering with aircraft in the area, the use of flairs and chaff will impact the environment as well as the livestock in the area.] GE-2

Reconsideration of this proposal is necessary. The Navy and Marine Corps have airspace stretching from California to Oregon, and the Air Force uses this space in Joint Training Operations. Continued militarization of the United States airspace is in conflict with the freedoms currently enjoyed in this nation.] PN-2

Citizens are watching the misapplication of the military while the military continues to push the edge of the envelop with respect to its limits under a Constitutional Government. Such expansion of the military, even into space, is discomforting to a populace currently experiencing what may well be an illegal war.] GE-3

Although war may be good business, it's bad policy. And a military constantly training to conduct war is bound to pursue warfare. The expansion of the Powder River Airspace for use by the military is a furtherance of continual warfare, aside from the interference civil aircraft and livestock producers will experience from the operations to be conducted in this airspace.] GE-6

I urge the rejection of this expansion.

Sincerely,

Edward A. DeCastro

Attention:
Ms. Linda Devine
HQ ACC/A7PS
129 Andrews St. Room 337
Langley AFB, Va. 23665-2769

They will take over 35,200 square miles of our space. When asked why you are taking our space? The answer back was "***You are a non populated area and a non producing area***." {Apparently we live out here and do nothing}.
Here are some points to think about. If they have all of our air space controlled by them.

1. How will The Oil Company's and Natural Gas Companies check there pipelines? Planes fly daily checking for leaks. SA-21
2. How will the crop dusters work? They fly when the wind does not blow. They would have to wait till the Air Force is done with practice runs. SO-2
3. Those of us who have the state trapper fly for predator control, He will no longer be able to fly. SO-15
4. Ranchers who check their cattle and sheep by flying over will have to go a different route. SO-11
5. This one really worries me, before the Air Ambulance can come to your town they have to get cleared airspace from the Air Force. They say they will give it but how fast will that replay come back? SA-19
6. The Local person who owns their own aircraft, when will they be able to fly? AM-12

Yes they will leave chaff from there practice runs, no comment has been made as to taking care of the sheep producer if his wool is discounted for having chaff in it. SO-12

I am against having the training area operating in this vicinity, as it appears to have more disadvantages to our needs and way of life than there will be advantages. We produce a lot more than you realize, and having this operating in our area will not be beneficial to our output . GE-2
I am a cattle rancher, and we cannot pay the bills by doing a 40 hour week like most people do. These restrictions will just make the job we do more difficult and time consuming. LU-3

Frank Mehling

I attended the public hearing for expanding the Powder River Training Complex held October 13, 2010 at the Baker High School AV room in Baker, Montana. Through public hearing testimony, eleven or twelve local individuals from the Baker and Fallon county area voiced their concerns and opposition to this expansion. At least half of these individuals are also pilots. Probably the most important concern would involve the Air Ambulance aircraft that provides emergency medical service to eastern Montana having to obtain IFR clearance when the PRTC/MOA is in use. Other concerns mentioned related to business type private jets and other business related aircraft not being able to fly into the PRTC/MOA area due to IFR flight restrictions, economic hardship on the local FBO due to fewer business related aircraft landing at Baker Municipal Airport, local pilots being apprehensive to fly VFR into an active MOA

1096

that is frequented by large and much faster military aircraft flying at low altitudes, transient pilots stating they will not fly to an airport located within the newly expanded PRTC, the "startle" and other effects on domestic and wildlife animals, noise and annoyance issues from the military aircraft during training exercises, possible contamination issues related to the dropping of chaff, devaluation to properties and real estate underlying the proposed expansion of the PRTC, and economic impacts to the region if the expansion is approved. SO-5 SO-13 SO-1

Now, I would like to add my sentiments on the issues previously mentioned. The Air Ambulance aircraft, usually flying out of Billings, Montana, is of great concern! This aircraft provides life saving abilities to rural communities that cannot offer the medical facilities and/or doctoring capabilities provided for at the Billings hospitals. It is mentioned in the EIS Alternatives A through C that emergency -related flight activities, such as life flight, would have priority over the military training aircraft. ATC would notify the military training aircraft of the nature of the emergency, and the training aircraft would relocate or vacate the airspace. The question is "how long would it take for ATC and the training aircraft to release the MOA airspace for a life flight air ambulance to accomplish it's mission"? When the doctors make the decision to dispatch the ambulance airplane to any of the rural communities it serves due to a life threatening situation, that aircraft needs to get into the air and head towards it's destination as quickly as possible without any delays! SA-19

Eastern Montana, and western North Dakota are situated within a large and very active oil and natural gas producing field. The Baker Municipal airport is frequented regularly by company jets, and other corporate types of airplanes related to this type of resource development. It has been reported that these business aircraft are required to fly under IFR rules due to insurance requirements, and possibly a general requirement for the type of aircraft. If the PRTC expansion is authorized, this would cause a hardship for these business endeavors whereas the resource companies involved need their people to be in several locations as quickly as time will allow. SO-8

Baker Air Service, Inc. is the local FBO at the Baker Municipal Airport. This FBO relies on aviation services that includes fuel sales to incoming traffic. If business related aircraft cannot fly into the area due to IFR restrictions when the PRTC area is active, this will likely cause an economic hardship to this FBO due to lost revenue from fuel sales. This FBO also flies an extensive pipeline patrol for the energy and oil companies in this area. The weather in eastern Montana can change quickly, sometimes after the pipeline patrol pilot(s) have been in the air for awhile. Visibility problems could require the pilot(s) to initiate a GPS instrument approach for landing. How would this be possible under the "no IFR flight" in the PRTC? SO-5 SO-17 SA-3

Local pilots have expressed an apprehension about flying in the same airspace occupied by B-1 bombers and fighter aircraft. Most locals fly at 500' to 800' AGL and quite often are looking downwards instead of outwards. Try to imagine the closure rate between a light airplane versus a military jet. The Super Cub pilot will be the big loser! SA-7

Baker Municipal Airport receives a fair number of out-of-area transient pilot visitations SO-6

2

1096

per year. Some of these pilots also purchase aviation fuel, and may have Baker Air Service do maintenance on their aircraft. Some of these pilots have stated they possibly would not fly into Baker Municipal Airport in the future if the PRTC expansion takes effect. This would cause another hardship on our local FBO! SO-6

Another concern relates to the "startle effect" and spooking of domestic animals from the low flying military airplanes. I ,too, am also a rancher and farmer living east of Baker, and would be included in the newly expanded PRTC. I also own and fly a Cessna airplane, and have personally witnessed a "startle effect" on confined cattle while I flew over another rancher's corrals at 800' AGL. Another local rancher, who also gave testimony during the Baker meeting, spoke of the problems that low flying military jets created for his ranching activities during ground-based target training exercises occurring in the 1980s. He reported that spooked animals ran through barbed wire fences resulting not only in damage to the fence, but also injury to the animals. These animals also possess keen peripheral vision. And, this rancher also gave indication that the pilots were flying much closer to the ground than the allowable 500'. Airplanes are inherently noisy, and the larger and more powerful they are the more noise they create. Atmospheric conditions, i.e. cold and/or moist air, seem to increase the noise levels. BI-4

The local population may become quite annoyed at certain times of the day , especially after sunset, if they are able to hear one or several military aircraft in the PRTC practice area. This, in my opinion, could be very bothersome during a person's sleep period, especially if a sonic boom took place during this sleep period. NO-5

Another issue brought to light at this meeting was a concern over possible contamination from the dropping of chaff to the wool that is shorn from sheep. Our ranch does not raise sheep, but when considered, I would agree that this contamination issue is possible. No one person would be able to say where the chaff that is dropped would finally land, considering the direction and velocity of the winds. I do know of some ranchers in the area that raise both cattle and sheep. SO-16

Property devaluation for lands lying within and beneath the newly expanded PRTC was another concern that was mentioned. To the best of my knowledge, this issue has not been tested in our immediate area, and would be better answered by a property owner in the existing MOA. The EIS states that expected property devaluation would be minimal. A portion of our property, which lies within a very active oil and gas field, has been professionally appraised for surface damage, and the resulting devaluation was minimal. Oil and gas production, in my opinion, will visibly damage the property much more than air traffic above the property will. SO-1

Negative economic impacts from the expansion of the PRTC could result from the decrease of air travel in the area, hardships to the local FBO, conception problems in domestic livestock, possible contamination to fleece and wool from the dropping of chaff, and the "startle effect" on confined livestock, which could result in a loss of weight gain. SO-16 SO-13

3

1096

In concluding opinions and suggestive viewpoints, I would consider Alternatives A, B, and C to have negative impacts on the expansion region as a whole. It has been suggested at a previous public hearing to move the entire training fleet of aircraft to Nevada (NTTR), but the Air Force replied THAT airspace is already too congested. So, why not transport a certain number of training pilots to these other training areas on a rotation basis, and utilize the aircraft that is already stationed there? GE-2 PN-2

If the Air Force absolutely believes it needs the expanded PRTC to train in, I strongly believe and suggest modifications to the expansion would be needed. One suggestion would be to continue using the existing Powder River MOA for low altitude (500' AGL), and the newly expanded airspace for medium to high altitude training, with the floor not lower than a prescribed height of maybe 8,000' AGL or 10,000' AGL. This would be somewhat similar to the outer limits of FAA Class B airspace, and would allow for IFR flights to continue below the PRTC expansion. DO-4

While the No-Action Alternative is most appealing, many residents, as do I, have the feeling that the Air Force is going to do what they want regardless of the feelings of the local population. I have not witnessed any willingness by the Air Force to negotiate a plan for the PRTC expansion that would be more consensual for both the local residents and the USAF. NP-1

The feeling of apprehension the locals have relates back to observations and personal experiences from earlier ground-based target training when a target facility was installed, probably in the 1980s, just a short distance of three miles northeast of the Baker Municipal Airport. These training routes passed over many rural residential areas; and several local residents witnessed F-111 and B-52 aircraft flying at times much lower than the allowable 500' limit. This training route passed 1/2 to 1-1/2 miles west of our farm. While my father was tilling fallow ground during one of these target exercises, an F-111 bomber "buzzed" his tractor by banking left then right at a very low altitude to act as tractor and implement were an obstruction in the bomber's path. When the bomber initiated a fast climb maneuver, my father said the vortices from the wings swirled the dust in the farm ground. The bomber pilot also did a "wing wave" as he/they departed to the north. My father was not amused!

I have in my possession a short video clip of a B-52 and F-111 both making low passes over the aforementioned target base facility northeast of Baker, MT. This clearly shows these two aircraft flying very close to the ground, and exhibiting acrobatic and somewhat reckless maneuvers by the F-111 pilot. This video also shows the wingtip vortices creating swirling dust clouds by the close proximity of the aircraft to the ground. If the EIS states a flight limit of 500' AGL, what will keep these pilots from flying lower than 500' AGL? It is widely speculated that the crash of the B-1 in the 1990s in southeast Montana was caused by some part of the aircraft, maybe a wing, striking the earth during a banking turn. Only those lost souls that were on that B-1 know what the actual cause was. At any rate, this aircraft was most likely flying much lower than 500' AGL. AM-14

4

1096

In closing, and I myself being a licensed pilot, flight training adds proficiency to a pilot's skills. I just believe this expansion, as submitted, would be too detrimental for the residents living within the shadow of the PRTC. As I mentioned previously, the video clip showing the low-flying B-52 and F-111 over the ground-based target facility northeast of Baker, MT clearly shows a probable "startle" effect for unassuming people and animals. I would like to show this video to any person(s) who has not had the opportunity to witness the size, speed, effects of wingtip vortices, and problems these low flying aircraft could create.

BI-4

SO-2

I truly believe the USAF needs to re-evaluate this proposed expansion, and try working with the residents living within the PRTC to reach a mutual agreement.

129 Andrews St, Room 337
Langley AFB, VA 23665-2769

Ms. DeVine,

My son and daughter-in-law attended the public hearing in Broadus, MT, October 12, regarding the proposed fly zone expansion. From the presentation they learned that you will not be using the flares mentioned on your website during county-imposed burn bans. The fire danger is a major concern for me as a rancher in northeast Wyoming. We are further pleased to hear that the chaff used in your training exercises quickly degrades. We work hard to keep our property clean and appreciate the fact you understand that. The sonic boom noise is a bit of an issue for us. The animals of the open prairie will most likely get used to it and most times have room to run if it does scare them. I'm sure occasionally the sound will push them through a fence. I guess we'll have to deal with that. It would be deeply appreciated if your pilots could avoid the flying near the buildings because it will push confined livestock into corners of steel pens and occasionally kill them. We experienced this when there were so many flights back in the early 80s. Is it possible for them to stay away from the buildings, possibly make it part of their training to avoid inhabited areas by a mile and a half or so, especially when breaking the sound barrier? Our coordinates are: N 44' 57.49 W 104' 46.46.

I truly support and appreciate a strong military and want to make it work. I recently watched a series of documentaries on World War II and the Nazis. It makes a person incredibly grateful to live in the United States. We don't want to impede the air force's progress but we do have to make a living and be able to sleep at night.

I own & operate a 10,000 acre cattle ranch in proposed area PR-1A/B MOA. Am an aircraft owner doing mostly lower level flying in the area. I see problems coming for local ranchers in this area if the proposal is enacted. Specifically livestock harassment, causing possible property damage or human or livestock injury. Also devaluing of land values, due to noise etc. Pollution from discarded chaff & flares. I regard this as a taking of our property rights. Let the infringing take place in the established areas Nevada etc. I attended the Sheridan WY meeting 10/19/10. No one there could give an answer about the amount of chaff that would fall on our lands. SO-13 SO-1 SA-27 PN-2 SA-28

The Low Flight Activity causes heightened excitability of Live stock especially cattle and horses. Therefore it would certainly benefit ranchers if this could be avoided during the months when livestock are concentrated or confined when risk of injury or damage could occur if they were "spooked".

For most ranchers in this area that would be in periods of calving (APR-MAY) and weaning (OCT-NOV) when livestock are most likely to be kept in small lots or corrals.

Your consideration of this situation would certainly make operating in these Low Flight zones more palatable. +!

1100

Ms. Linda Devine, Program Manager
HQ ACC/A7PS
129 Andrews Street Suite 337
Langley AFB, VA 23665-2769

Dear Ms. Devine

I commented orally on the proposed Powder River MOA expansion at the Buffalo SD hearing on September 17, 2010 and want to follow up with written comments.

Effects on local civilian aviation:

On page ES-11 of the executive summary, the DEIS estimates that 129 civil operations could be impacted when Alternative A MOA's are activated Monday through Thursday an approximately one third that number on Friday morning. First, I think you need to look at the number of planes that FAA has registered in counties under the Alternative A proposed expansion. I have a list that shows well over three hundred airplanes registered to individuals in just the South Dakota counties under the proposed expansion. I personally know of 18 airplanes, almost all based on ranches, in my county of Harding, South Dakota. When ranchers like myself fly our planes to check pastures and livestock, we do not file flight plans with Flight Service because they are not geared to follow local flights below five hundred feet AGL that are checking livestock in the south pasture of some ones ranch. Therefore, I do not believe you are picking up all of the civilian air traffic in Harding County. I typically fly two hours every other morning all spring summer and fall. Like crop sprayers and pipeline check flights, ranch pilots are looking at the ground and typically fly under 500 feet AGL to avoid traffic which brings us to the proposed 500 ft floor of Alternative A. I learned when I was a student pilot, that wing vortices from heavy aircraft go down 900 feet below the aircrafts flight elevation and travel out in a forty five degree angle somewhere around twenty knots. If I am flying my 780 pound Piper PA-11 at 300 feet AGL, over my property looking for sheep, checking fences etc., and a B1 flies over me at 500 feet, the turbulence could cause me to crash. Approximately 19 years ago I was crossing a low level military training route north of Belle Fourche, Butte County SD in a BC 12D Taylorcraft. I was really scanning because I knew the route could be active. At the last minute, I looked back behind and saw a B1, wings swept back, at my elevation, less that one quarter of a mile away, turning toward and bearing right down on me. I dove for the ground and flew out at a 45 degree angle and fortunately, did not get in any turbulence. I don't believe they ever saw me. This MTR is clearly marked on sectional charts. It was my responsibility to watch for B1's and I was. Here is the point. A B1 with wings swept back coming toward you at low altitude several miles away does not have a large profile and is not easy to spot coming directly toward you even with the most vigilant scanning. At their speed of travel, they close on a small plane traveling at 70 knots before you can them coming. A small fabric plane is very difficult for them to see. For these reasons, the proposed 500 ft MOA floor is not safe for civil aviators or military flights and must be raised to two thousand feet because of the wing vortices.

SA-7

1100

Specific Impacts on Sheep Ranchers

Northwestern South Dakota and southeastern Montana is major sheep producing areas. There are 30,000 plus sheep each in Butte and Harding counties and around 18,000 sheep in Perkins county just in South Dakota. Center of the Nation Wool in Belle Fourche SD is a major wool shipping point in the United States. I know you have received testimony from Larry Praeger, manager of Center of the Nation Wool, about the importance of wool to the military coming from the area underlying the Alternative A proposed expansion. My 2010 wool production went into the military contract. The first point is: when chaff is dropped over pastures with sheep in them, will it contaminate wool on the sheep. This should be determined prior to any chaff deployment. My west ranch is under the current Powder River MOA, but we have, to my knowledge, not had chaff deployment. SO-16

The second point is the ability to conduct timely predator control with permitted airplanes under the MOA. I am permitted by South Dakota to conduct predator control with my airplane and work with my neighbor on the adjoining ranch that also runs sheep and is also permitted to do aerial hunting. We have been able to minimize sheep loss to predators on our ranches. Others are not so fortunate. I know of one ranch in Harding County that has lost 100 lambs this summer. If I start losing sheep to predators, and military flights down to 500 ft. in the proposed Powder River MOA expansion stop me from using my airplane to control predators, I will have to sell my sheep period. I cannot wait a few days and while continuing to lose animals to predators. This is true for all the sheep producers that I have talked to. SO-15

Flare and Chaff Deployment

In addition to potential contamination of wool, dropping chaff on pastures with sheep lambing and cows calving in the spring is not conducive to good animal husbandry. If the contamination question can be answered, chaff deployment should be done only in the winter time to minimize impact on young lambs and calves. BI-5

Flares are more problematic. Page ES 15 of the executive summary states that every three years a dud flare could fall and there is a slight potential for increased fire risk if flares are accidentally deployed substantially below authorized altitudes. The October 3rd issue of the Rapid City Journal reported that in 2007 a flare was accidentally deployed too low 25 miles north of Atlantic City NJ. at the Warren Grove Gunnery Range. 6000 people were evacuated, 17,000 acres burned and 13 homes were destroyed or damaged. This is what we are worried about. SA-5

If this happened on my ranch, who pays for the damage, and where do I move my livestock so they have grass to eat and who helps me do it? SA-6

There is a natural gas field on part of my ranch and parts of neighboring ranches in southwestern Harding County. There is another natural gas field southwest of Buffalo SD. From Buffalo SD north to Rhame ND and Bowman ND there is continuous oil field. SA-12

To my knowledge, there is no firefighting equipment capable of handling gas or oil field fires in Harding County should a flare start a fire like the New Jersey event. If flares are used, they should only be deployed in the winter to minimize fire danger and impacts on young livestock. SA-13

Finally, how do you determine that this fire risk is acceptable to people living in rural areas, but not acceptable to people in urban areas?

1100

Impacts on Sage Grouse

Since your scoping meetings were conducted, the US Fish and Wildlife Service listed the Sage Grouse as "warranted but precluded" under the Endangered Species Act. This is a first step to an endangered species listing. Marion Adkins, BLM area manager for South Dakota, was quoted in the Belle Fourche SD Butte County Post, saying that there are no studies on the effect of noise on Sage Grouse. I don't know if noise affects Sage Grouse or not. You, however, need to know before Alternative A is implemented. If noise, chaff, flares, or any other activity related to low flying military aircraft impacts Sage Grouse, the Air Force can stop flying. We cannot just walk away from our homes and ranches. We would be left with increased costs modifying our ranching practices to help a species that may be endangered from activity that we have had nothing to do with and no control over.

BI-3

SO-1

Thank you for the opportunity to submit comments on the Powder River MOA Draft Environmental Impact Statement.

Sincerely:

Larry Nelson
[redacted]

1101

28 Dec 2010

Ms. Linda DeVine
Program Manager ACC/A7PS
129 Andrews St., Suite 337
Langley AFB, VA 23665

Dear: Ms. DeVine

Please accept my opposition to the proposed Powder River airspace MOA expansion.

The expansion is not necessary. Dropping of flares is a fire hazard in the West. Dispensing metallic chaff is old technology and is a hazard to other aircraft and wildlife besides polluting the environment. Is the Air Force going to send out teams to pick-up the chaff and spent flare casings of different jurisdictions without leaving the land damaged? I think not.

PN-2
PN-3
SA-5
SO-12

The Powder River MOA is an artificial block to low altitude general aviation air traffic flying North and South along the front range because of the higher altitudes to the West. Expanding the MOA four fold will cause deviations and increased costs for those operators.

SO-7

In this day and age and what is on the horizon of austerity and cut-backs, is the Air Force willing to take on the additional liability costs and operating costs of four times the area?

SO-14

This proposal is a plain and simple self promotional activity for a Major to get promoted to Lt. Colonel etc. Have seen it happen many times in my civil service career with the Air Force.

I support AOPA's position and as a member.

Yours truly

Lawrence O. La Beau

As a rancher residing below the proposed PR-1A MOA, I'm extremely concerned of the mid-air potential. We have a Super Cub that we fly daily for approximately nine months of the year. We fly @ a 500'-1000' AGL over terrain that has an average relief of about the same. That places us in a quite vulnerable regime concentrating of terrain avoidance at the expense of the safe & sound environment. When in the bottom of a valley & flow up over the top of a ridge, I'll have little if any opportunity to see and avoid. SA-1

I'm also concerned about the flare hazard times. As an ex-fighter pilot, who dropped many flares, I'm (over) SA-5

positive that some don't burn out as expected. Your agreement to discontinue the use of flares during peak fire season confirms my belief that you, too, expect an occasional flare/ground contact. Just last Oct (2009) a neighbor burned off 640 acres with a slash burn that got away. October certainly isn't peak fire season but grass still burns. I lost a half section of grass in April a few years ago by burning dead spears with a skiff of snow on the ground. My point is: Our grass will burn @ almost any time of the year if we have little or no snow cover. Your flares are unlikely going to result in huge fires. SA-5

I suggest that if you're going to expand the MOA, that you use a floor of at least 2000' AGL and you establish a minimum altitude of 10,000' AGL for dispensing flares.

On another note, since the Mont ANG is transitioning to the airlift mission, I suggest that you utilize the HAYES MOA which ~~[redacted]~~ already exists. PN-2

We are Concerned with The expansion of The Powder River Training Complex for a Couple of reasons. The area North of Lemmon S.D. is where OUR Farm/Ranch is Located is in the Proposed training area. I grew up on this 101 year old Family homestead and remember when this area was part of the Fly zone before. Many Times we were supprised to the point of Shaking when Operating machinery or Concentrating on our work when with no advance notice you would see a Shadow or worse yet hear a Loud noise From a low Flying air craft and nearly scare you to death. I did not Like it then and don't think I would Like it now. Beyond personally being Surprised NO-2

To the point of shaking, I also have livestock on our Farm/Ranch. Both myself and my wife have off Farm/Ranch employment that takes us away during the day. Unlike in the 1980's when they flew this area, someone was always here for the most part to round up spooked calves and cows after they were surprised by a low flying aircraft or from the noise. BI-4

Today because we have to be gone during the day no one will be around during the day to gather cattle and settle them back down as well as starting to repair fences and etc that got broken when they got surprised + spooked. SO-13

I am very careful with my livestock and if this is the way it will be I won't take the chance of this happening when we're not here to deal with hurt animals or worse. We will have to probably sell out our herd.

Beyond the concern for our animals we both have very busy weeks at work and very much look forward to coming home nights and weekends to enjoy the peace and quiet of this remote butte country. I can't see how all of this noise and surprise tension will be good for our lifestyle. LU-2

My other concern is for the value going forward of ours and many other "hobby Farm/Ranches" in this area when we can no longer offer the value of peace and quiet to enjoy our animals. SO-1

Thank you for allowing me this comment.

Sincerely

Tom Thom

26 Apr 2010

Colonel Jeffrey B. Taliaferro
Commander, 28th Bomb Wing
1958 Scott Drive, Suite 1
Ellsworth AFB SD 57706-4710

Mr. J. Marvin Kammerer
[redacted]

Dear Mr. Kammerer

After our meeting last month, we had our staff investigate some of the specific concerns you and your neighbors shared with me. Specifically, that there were dangerous chemicals (perchlorates) in chaff/flare and that the grass heights around the field were a fire hazard. I've included some of the detailed work since I expect you'll be interested, but here's the executive summary:

1) Chaff has been tested extensively to ensure it doesn't have a negative impact on humans or cattle. We've attached a three page analysis of our research. If you have any contradictory evidence/studies that we couldn't find we'd be happy to review it.

2) Air Force guidance requires us to keep the grass near the airfield between 7 and 14 inches high to try and protect the area while also discouraging birds and other animals from being in the area. When aircraft run into animals either on the runway or in the air it can be catastrophic. This is also why Air Force guidance directs us not to have cattle grazing near the airfield.

3) The explosives in flares, just like fireworks or a road marker flare, do contain a minute amount of perchlorates. However, studies on the subject concluded they were "not considered a concern," to the environment in the same way fireworks or road flares are not a concern.

I apologize for not being able to provide these answers at our meeting, but very much appreciate gaining a better understanding of your concerns. If these answers do not sufficiently answer your questions, please get back to us with any further questions.

Thanks

JEFFREY B. TALIAFERRO, Colonel, USAF

South Dakota Stockgrower's resolution opposing the Powder River training expansion

Whereas, The Air Force has proposed expanding The current Powder River training complex in Montana, South Dakota and Wyoming from 5,900 squares miles to 37,000 square miles in Montana, North Dakota, South Dakota, and Montana, and

Whereas, All areas will include flights, at 500 feet above ground level, and higher, with afterburners applied in every mission, and

Whereas, Magnesium flares, which burn at 2000 degrees, and chaff, which is extremely fine aluminum and fiberglass, will be discharged in all areas of the MOA, and

Whereas, Supersonic flight will be used in all areas of the MOA, even though civil aviation has been prohibited from flying at supersonic speeds over the mainland since the mid 1970's because sonic booms caused glass and structural damage, and

Whereas, Large force maneuvers, including forces from other countries, will train in the MOA on a quarterly basis, and

whereas, Low-level flights and sonic booms have been known to cause animals to bolt, stampede, throw riders, and cause injury to themselves, humans, and fences, and

Whereas, Low-level flights would prohibit farmers from using crop dusters during the morning and evening hours (when nearly all spraying must be done), and wing vortices could deflect spray up to 1000 feet, making chemical application with ground rigs dangerous, and

Whereas, Significant impacts on mining could result from electronics emissions inadvertently setting off mining or construction explosions, and

Whereas, Low level and supersonic flights have the potential to disturb loose soils on slopes, as is common in surface mining, and

Whereas, The Powder River Basin has 58% of the known coal reserves in the U.S., and

Whereas, Commercial air traffic will not be routed through an active MOA, and will face re-routes or an average wait of 2 hours on the ground, and

Whereas, Several hundred commercial air carrier flights use the proposed MOA airspace on a daily basis, and

1104

Whereas, This area is the severe weather re-route airspace for major airports throughout the Great Plains and Ohio Valley, and

Whereas, Inability to use this air space for the 80 to 100 days that it is now used in bad weather would create backlogs of aircraft waiting to depart at airports including, but not limited to: Seattle, Oakland, Kansas City, Chicago, Cleveland, Washington D.C., New York, Minneapolis, Chicago, and Detroit, and

Whereas, Small airports, as well as private airstrips, will be shut down during the usual Monday through Friday training and the Quarterly, weekend training sessions, and

Whereas, Delays and extra fuel used routing around the airspace will put a significant burden on already stressed commercial airlines, and

Whereas, The primary reason given by Ellsworth for needing this 4-state area, was fuel saving, not having to fly their 24 B-1s to 'remote' areas like Idaho or Nevada, and

Whereas, No offer of payment to land owners, or other impacted industries has been made, and

Whereas, Damage claims are supposed to be sent to the Ellsworth Public Affairs office, which has been ineffective in the past,

Therefore be it resolved, That the South Dakota Stockgrowers opposes expanding the Powder River Training Complex, or adding flares and chaff and supersonic flight in the current Powder River MOA, and] GE-2

Be it further resolved, That if this expansion is approved, damage claims be handled on a local level by elected officials of each county, city, or township, and] SO-12

Be it further resolved, That affected property owners be fairly compensated for the taking of their airspace.] SO-1

RR-188 B-1 Training Chaff & USAF Self Protection Flares

Source Document: Environmental Effects of Self-Protection Chaff and Flares, USAF Air Combat Command, Final Report August 1997

Q: Chemical composition of RR-188, training chaff and how does it decompose? Are there any hazards?

Composition

The Chemical composition of RR-188 training chaff is "aluminum-coated glass fibers". "The glass fiber dipoles are generally 1 mil (25.4 microns) in diameter, including the aluminum coating which is 0.12 mil thick" (p.3-3). In other words, each single piece of chaff is smaller than a single strand of (short length) human hair. Visually, it may look like tufts of animal hair on vegetation (if clumps—very unlikely).

The chaff is coated with 1 percent solution of NeoFat 18 (90 percent stearic acid and 10 percent palmitic acid) with naphtha as the solute. Naphtha is driven off during the curing process.

Stearic Acid is a naturally-occurring saturated fatty acid used as an emulsifier and emollient. It's found in many saturated oils like palmand coconut, but it can also be derived from animal sources...like cow fat or pig stomach. So found in vegetable oils and as a glyceride in animal fat. Most sources of stearic acid are from animal sources.

"Potential exposure to wildlife may primarily occur through ingestion; however, the quantities required to produce toxic effects are relatively high for most species. Literature review reveals that probable lethal dose (LD) for humans would be consumption of more than 2.2 pounds of stearic acid at any one time by an individual weighing 150 pounds" (3-12). A bundle of chaff weighs about 3.4 ounces and of this about 10 grams is stearic acid. Based on this is, it would take the consumption of 100 bundles of chaff to achieve a lethal dose of stearic acid.

> Note: Chaff made 10 years ago contained lead. No chaff used or manufactured today contains lead. "The specification for that chaff is no longer in effect, and Tracor has indicated that lead has not been used for over 10 years (Creel, personal communication, 1993)" (P.3-3).

The other source of chaff debris can be associated with how it is dispensed. The B-1 uses a pyrotechnic ejection and retains the tube that contains the RR-188 chaff. Debris is only from two 1 inch square pieces of plastic 1/8 inch thick (the piston and the end cap) and a felt spacer. Other aircraft may use a cardboard material, made from recycled kraft paper and is biodegradable.

11042

B-52s still use variations of RR-112 (RR-112A/AL and RR-112/AL) chaff. The A/AL is aluminum coated glass and the AL is aluminum foil.

Toxicity

"Based on reviews of numerous toxicological studies, the principal components of chaff (aluminum, silica glass fibers, and stearic acid) will not pose an adverse impact to human and environmental health". This is based on general toxicity of above elements and the dispersion patterns of chaff. The Toxicology of chaff is sourced from the U.S. EPA's TOMES database.

Silica is an abundant compound found in nature that is prevalent in soil, rocks, and sand. Silica is practically nontoxic if ingested. Other trace elements that can be found in the aluminum coating are: silicon, iron, copper, manganese, magnesium, zinc, vanadium, and titanium. Iron, like Silicon, are abundantly found in nature. Of the other trace elements, OSHA and CERCLA have reportable threshold standards of 5,000 pounds and 1,000 pounds for elements such as Copper and Zinc. However, these amounts are found only as trace elements in Chaff. At a range such as the Nellis Test and Training Range (NTTR) where Chaff is used on a much more frequent basis in comparison to the PRTC, "the total weight associated with annual chaff utilization would be about 20 lbs for each element" (p.3-11).

Safety

There are no documented incidences of injury due to falling chaff debris. Debris consists of chaff itself, possible cardboard (B-52) flat plastic package stiffeners, a small plastic piston, and a small plastic end cap. Under normal circumstances, all of those elements weigh so little, or create so much drag in comparison to their weight, that no injury would be anticipated if a person ever was in contact during fall.

If in the most remote likelihood that an unopened bundle of B-52 chaff were to impact a person it would be comparable to "an eight-pound sledge hammer dropped from a height of approximately 10 inches".

"Probability of occurrence is 1 in 63,000 or 1 in 42 years".

Soil Chemistry

There are no existing reports that provide substantive data regarding effects of chaff on soil. Some studies have inferred the potential for impacts based on chaff's elements, but there is no systematic analysis of chemical changes in the soil. Recall, the major components of chaff, silica, aluminum, and stearic acid, are generally prevalent in the environment. Aluminum is the 3rd most abundant element in the earth's crust. The solubility of aluminum is greater in acidic and highly alkaline soils than in neutral pH conditions. Stearic acid is an animal fat that

1104
3

degrades when exposed to light and air. Dissolution will be greatest where water content is high. Thus, weathering will be more rapid in wet, acidic environments than in dry, neutral and alkaline environments.

Livestock Studies

Several experiments have been conducted regarding ingestion of chaff by livestock but that essentially no field data have been collected to describe exposure of wildlife to chaff. Cattle and goats apparently avoided eating clumps of chaff placed in their feed. Calves fed chaff in dry meal would consume chaff only when it was coated with molasses and thoroughly mixed into the meal (Barret and Mackay 1972). A similar study using cattle and goats found that the animals avoided consuming intact chaff (Taylor 1983). No evidence of digestive disturbance or other clinical symptoms were observed in calves fed chaff (Barret and MacKay 1971). The experimental and control groups gained weight at the same rate, and blood samples showed no deviation from normal. Postmortem examinations showed no lesions of pathological significance that could be attributed to chaff.

Overall

Chaff contains naturally occurring elements in very low concentrations and the dispersion rates of chaff falling to the earth further mitigate the effects. Decomposition of chaff depends on the environmental conditions. In aquatic environments, chaff is expected to have no adverse impacts on water chemistry or aquatic life. On land, chaff would be subject to disintegration due to abrasion from surface features in arid areas and chemical processes in wet, acidic environments. In research studies, cattle avoid eating chaff and if ingested, chaff does not contain concentrated amounts of elements that could be harmful. To obtain a toxic intake amount is unrealistic in real-world conditions (reference 150 pound person consuming 2.2 pounds of chaff). In arid areas, the slow chemical decomposition is not expected to have an adverse effect. In wet climates decomposition is more rapid. Regardless, the constituents of chaff and chaff debris are either inert or already prevalent in the environment.

USAF Self Protection Flares

United States Air Force aircraft, such as the B-1, use self-protection flares to decoy Infra-red seeking missiles away. There are several different variants of self-protection flares used by the USAF to include, but not limited to: ALA-17 (B-52), MJU-7 B (F-16, C-130), MJU-7A B (F-15, F-16, & C-130), M-206 (A-10, AC-130, C-17, & F-16), MJU-10 B (F-15) and MJU-23 B (B-1). The MJU-23 B weighs approximately 43 oz.

- -

NEW YORK (Reuters Health) - Living with airplanes regularly thundering over your head could risk the healthy pumping of your heart, suggests a new Swiss study.

Based on 4.6 million adults across Switzerland, researchers found that dying from a heart attack was more common with increased exposure to aircraft noise.

"The effect was especially evident for people who were exposed to really high levels of noise, and was dependent on how long those people had lived in the noisy place," researcher Matthias Egger of the University of Bern, told Reuters Health.

This isn't the first time that noise has been linked to negative health effects, including cardiovascular risks. But it could be novel progress in determining whether the sound is

Davies pointed to two possible pathways by which noise could harm the body. The first is the well-known fight-or-flight response. "You hear a really loud noise and the first thing you do is jump into the air, literally startled," he told Reuters Health. "We're hard-wired for this response, and it's not something you can easily turn off."

The other path is more indirect: annoyance. Even if something isn't that loud or disturbing, such as a neighbor's radio, it can become really bothersome if they don't turn it off, he said.

At the end of both routes is the classic stress response, Davies added, which includes a rise in heart rate and blood pressure. Although usually not a problem when it's experienced in short, infrequent bursts, this kind of response can lead to significant wear and tear if it continues daily -- as it might if you live on a busy road or under a flight path.

Of course, road and air traffic produce different noise patterns that might not be easily comparable. Road traffic noise is much more constant and arguably easier to get used to than the startling roar of a plane taking off or landing, suggested Egger.

"Noise probably does have effects on health and it is important that we gain a better understanding of these," he said. "Our study can't prove a causal relationship, or be directly generalized. We need further studies."

An earlier study looking at noise exposure during sleep revealed a significant increase in blood pressure from aircraft noise, road traffic and other indoor sources such as snoring.

"This implies that it is the noise itself regardless of the sources that affects the blood pressure," Jenny Selander of the Karolinska Institute in Stockholm, Sweden, and who was not involved in the study, told Reuters Health in an e-mail. "I believe that applying these findings to other traffic-related noise sources would be fine."

As the evidence builds, the researchers suggest that further measures should be added to protect people. Sound barriers, controlling the speed and volume of traffic, and better home insulation can all help to reduce exposures, said Egger.

Pentagon Spending More Than All 50 States Combined

By Sherwood Ross

The U.S. spends more for war annually than all state governments combined spend for the health, education, welfare and safety of 308 million Americans.

Joseph Henchman, director of state projects for the Tax Foundation of Washington, D.C., says the states collected a total of $781 billion in taxes in 2008.

For a rough comparison, the total budget for what the Pentagon calls "defense" in fiscal year 2010 will be at least $880 billion and could possibly top $1 trillion. That's more than all the state governments collect.

Henchman says all American local governments combined (cities, counties, etc.) collect about $500 billion in taxes. Add that to total state tax take and you get over $1.3 trillion. This means Uncle Sam's Pentagon is sopping up nearly as much money as all state, county, city and other governmental units spend to run the country.

If the Pentagon figure of $1 trillion is somewhat less than all other taxing authorities, keep in mind the FBI, the various intelligence agencies, the VA and the National Institutes of Health (biological warfare) are also spending on war-related activities.

A question that describes the above and answers itself is: In what area can the federal government operate where states and cities cannot tread? The answer is: foreign affairs – raising armies, fighting needless wars, conducting diplomacy etc. And so Uncle Sam keeps enlarging this area. His emphasis is not on diplomacy, either.

For every buck spent by the State Department, which gets some $50 billion a year, the Pentagon spends $20. As for the Peace Corps, its budget is a paltry $375 million – hardly enough to keep the Pentagon elephant in peanuts.

"The total budget for what the Pentagon calls 'defense" in fiscal year 2010 will be at least $880 billion and could top $1 trillion."

Nobel Prize economist Joseph Stiglitz and finance authority Linda Bilmes write in their *The Three Trillion Dollar War: The True Cost of the Iraq Conflict*, "defense spending has been growing as a percentage of discretionary funding (money that is not required to be spent on entitlements like Social Security), from 48 percent in 2000 to 51 percent today. That means that our defense needs are gobbling up a larger share of taxpayers' money than ever before."

And they add, "The Pentagon's budget has increased by more than $600 billion, cumulatively, since we invaded Iraq." With its 1,000 bases in the U.S. and another 800 bases globally, the U.S. truly has become a warfare state. Today, military-related products account to about one-fourth of total U.S. GDP. This includes 10,000 nuclear weapons. Indeed, the U.S. has lavished $5.5 trillion just on nukes over the past 70 years.

No other nation has anything remotely like this menacing global presence. The Pentagon strengthens its grip by running joint "training" exercises with the military of 110 other nations, including outright dictatorships that suppress internal unrest.

The U.S. spends more on weaponry than the next dozen nations combined and is by far the No. 1 world arms peddler. "The government employs some 6,500 people just to coordinate and administer its arms sales program in conjunction with senior officials at American embassies around the world, who spend most of their 'diplomatic' careers working as arms salesmen," writes Chalmers Johnson in *Blowback: The Costs and Consequences of American Empire*.

Johnson goes on to say the U.S. military establishment today is "close to being beyond civilian control" and that despite its ability to "deliver death and destruction to any target on Earth and expect little in the way of retaliation" it demands more and newer equipment "while the Pentagon now more or less sets its own agenda" and "monopolizes the formulation and conduct of American foreign policy."

How long will it be before this tyrannical, anti-democratic colossus that is sucking up as much money for war as all states, counties and cities spend on peace – and which straddles the globe, boosts dictators and beats the war drums – turns on its own people" ★

Sherwood Ross is a public relations executive in Miami and has written for many ladies and arts services.

risk Somewhere else could be catastrophic here. The idea of small pieces of "plastic" or "chaff" falling from planes in our pastures and water cannot be dismissed lightly. Our cattle do not need to ingest this. We have oil and gas pipelines already going through our ranch. One ruptured pipelines cannot be flown over and checked often we are looking at possible disasters. We need medical planes to come in from Billings to fly our residents to Billings. The idea of getting a hold of The Air Force to cease their "bombing" missions so we can fly someone out is unacceptable to me. IT was mentioned many of the residents are at poverty level and there aren't very many people... would the Air Force see things differently if we were all wealthy. This does nothing to help The Montana economy. They closed the Glasgow Air Force Base several years ago. What benefit do Montanan's get? If Ellsworth wants to remain open and it is so safe... stay in South Dakota. I am pro-military but they have deserts to fly over. Their program can go on.

HOWEVER, THE PROPOSED EXPANSION SEEMS QUITE EXCESSIVE IN THAT IT APPEARS TO BE AT LEAST 3-4 TIMES LARGER THAN THE CURRENT POWDER RIVER MOA. AM-6

I DON'T LIVE IN OR NEAR THIS PROPOSED MOA, BUT DID VACATION THERE THIS PAST SUMMER. (WE PLAN TO AGAIN.) FORTUNATELY, IT WAS INACTIVE AT THAT TIME AND I WAS ABLE TO FLY DIRECTLY THROUGH THE PR-MOA FROM BUFFALO, WY TO BOWMAN, ND. ACCORDING TO THE MAP, HAD THE PROPOSED MOA BEEN IN PLACE AND ACTIVE, FLYING INTO BOWMAN WOULD EITHER HAVE TO BE CANCELED/PROPOSED OR "TAKE MY CHANCES" AND FLY THROUGH ANYWAY. I PREFER TO RESPECT ACTIVE MOA'S FOR MY SAFETY, OF COURSE, BUT ALSO A "STRAY AIRCRAFT" CAN CAUSE IMMEDIATE CANCELATION OF A MANEUVER. THIS ONLY COSTS MORE IN TIME AND FUEL TO COMPLETE THAT PRACTICE SESSION IN ADDITION TO THE SAFETY ASPECT. SO-7 SA-7

DOES THE AIR FORCE REALLY "NEED" THAT MUCH AIRSPACE? PN-2

ISN'T THERE A COMPROMISE WOULD WORK FOR THE AIR FORCE AND BE LESS INCONVENIENT AND RESTRICTIVE TO GA? GE-11

THANK YOU FOR RESPECTING MY THOUGHTS.

To begin with, the public comment meeting "announcements" left a lot to be desired. Our postcard was postmarked September 14, 10 and we received it in the mail on September 20, 2010. Unfortunately, the closest meeting to us was held on September 16, so by the time we knew of it, the meeting was over. To attend the next closest meeting, we had to drive 180 miles round trip. This is not good public outreach, and would seem that the Air Force did not really want a large public turnout. The remainder of my comment is attached. NP-8

PUBLIC HEARING FOR THE
PROPOSED POWDER RIVER TRAINING COMPLEX

The following statement is my public comment on the EIS for the Powder River Training Complex, put out in August 2010. I live in the Northeast corner of Wyoming, and I am not in favor of Alternatives A, B, or C. Our county's economy relies on ranching, tourism, revenue from hunters, and home and land resale; all of which will be negatively affected by these alternatives. These alternatives also will be detrimental to the environment, livestock, wildlife, and to our quality of life. GE-2

I do not feel that the Air Force has shown that they can address the negative impacts of these proposed alternatives. I do not feel that the Air Force has researched the negative impacts thoroughly, and that they have minimized most if not all of the stated impacts. SO-22

Airspace/Air Traffic

We have limited flights from Rapid City, Gillette, and Casper already. These increased military flights will definitely impact the commercial flights in and out of these airports, resulting in loss of revenue for local commercial pilots, as well as inconvenience for private passengers. They could also endanger commercial flights, through inaccurate or non-existent communication of flight schedules. SO-5

Noise

The EIS states that there will be environmental impacts from an increase in ambient noise levels, low-level startle effects, and sonic booms. The EIS is definitely correct in stating these increases will "be perceived as a significant impact by residents under the airspace". This is true for many reasons.

To begin with, these increased noise levels will totally destroy our quality of life. We sacrifice the amenities of populated areas for the benefits that the rural life brings; benefits such as the peace and quiet, the wildlife, and the freedom from the anxieties of a more populated space. With the increased noise from the proposed alternatives, we stand to lose all that we cherish. LU-2

These increased noise levels also present a huge safety issue for the ranchers, cowboys, and recreational riders who work closely with livestock; doctoring them, shoeing them, riding them to round up cattle or for enjoyment, and all other forms of interaction. There is a great deal of chance of putting the people and animals in harm's way, due to animals' reactions to these sudden loud noises. A person working with a horse, or riding a horse when a sonic boom occurs could be thrown off, kicked, and even trampled. Serious injuries could easily occur around any livestock in this event; far more serious than being "annoyed". As an example, we are already in the MOA, and although they are not supposed to fly low over our houses at this time, it has occurred in the past. On one particular time, they appeared so suddenly and with such a sudden so-called "startle effect" that I physically feel to the ground holding my ears as I watched my cows and my horses bolt and run through the fences, tearing the fences down and causing extensive injuries to the livestock from barbed wire cuts. Fortunately I was not on SA-9

1108

one of the horses at the time, as I believe that injuries I would have sustained would have possibly been life threatening. Scheduling these flights to reduce the startle effect is a completely irrational idea when dealing with livestock, wildlife, small children, infants, and the elderly. Temporary avoidance areas for those who are branding or calving will be helpful, but not everyone who works around and/or rides horses is in an area that will be included in this. People in our area do not just ride horses when they are gathering or branding; it is a continuous part of our lives. Apparently those who have written this environmental impact statement have never worked with or around animals a single day in their lives.Therefore, the so-called "startle effect" has the potential to have a hugely negative safety impact on our area.

SA-9

Increased noise levels could also have a negative impact on our area economically. Our county's economy relies heavily on ranching, tourism, and revenue from hunters. Ranching can be affected, as flights within 500' of ground level will be stressful to livestock, and have a negative impact on breeding rates. Many people come to our area to experience the beauty and the quiet. With military jets flying over, there is a high probability that these tourists will take their dollars elsewhere. We also have Devil's Tower National Monument, the first National Monument in the nation. The impact on that spectacular area would be devastating to have such a loss of revenue from tourists. The same applies to areas near the Bighorn Mountains, which includes a wilderness area that could be affected by this plan. Each year thousands of hunters come from out of state, as well as within the state to our area to hunt deer, elk, turkey, antelope, and much other wild game. Hunting simply cannot take place in an area where jets will suddenly appear loudly out of nowhere. Again, the loss of hunters to our area will have a huge economic impact.

SO-22

SO-9

Safety:

Airline crashes have been known to be caused by bird strikes. These proposed areas are in large migratory flight patterns of several species of birds, including large species such as ducks, geese, and even Sandhill cranes. There is a huge probability of a bird strike, resulting in an airline crash, during the several weeks of migration in the spring and the fall.

SA-10

The dropping of chaff also present a huge safety issue for the residents of our area. There are many reports stating that the health impacts from chaff to humans and animals have not been studied completely, and that the residents of these areas should not be used as human guinea pigs. There has not been enough research on how the silica coated aluminum affects the respiratory system of humans or animals. The EIS states that "chaff are very fine (finer than human hair)", as if this makes it okay to drop on people and animals. The fact that it is finer than human hair makes it clear that it can be breathed by both people and animals. The EIS states that the larger pieces could fall with the "impact of a large hailstone". When people are out, they know when a hailstorm is about to be upon them, and they seek shelter. To have something the size of a large hailstorm fall randomly out of the sky is likely to cause injury to an unsuspecting human or animal.

SA-14

SA-27

Dropping of flares is another safety issues. The EIS states that the likelihood of a person finding a dud flare is very low. If it happens even one time, it is a safety

SA-14

1108

issue. To expect that every person and every child within these large flight areas would be educated about dud flares is a totally irresponsible stance to take by the air force. It is just as likely that a child or young person could find it and injure themselves, instead of "notifying a public safety authority of its location." SA-14

The biggest problem from the flares is that there is a high probability that these could cause a devastating wildfire. The EIS states that they will not drop these during severe fire conditions, but after seven years of drought, many of the proposed areas are under a constant state of severe fire condition. Even with the last couple years of rain, the residents remain extremely vigilant of fire hazards and conditions from late June through the first snow, which can be as late as the end of November. Just a few years ago, one lightening strike caused a fire that burned over 25,000 acres, killed livestock and wildlife, and threatened several homes. We cannot afford to have another possible cause of wildfires in our area, especially since we rely on a small force of volunteer fireman to fight our fires. To take that chance just to practice military maneuvers is simply unconscionable. SA-5

In conclusion, I feel that the EIS has not addressed the full potential of the negative impacts to the areas that stand to be affected by this proposal. Just because there is a smaller population in these areas, does not mean that there should be less concern for our safety, our livelihoods, or our quality of life. It would be a huge disservice to those who have chosen to make our living and establish our homes in these areas, to allow this proposal to so negatively affect our lives. EJ-2 LU-1

Written Comment Sheet
Public Hearing for the Proposed Powder River Training Complex

Thank you for your input! **DATE:** 10-26-10

PLEASE PRINT

I am writing to comment on the proposed expansion of the training area for the Air Force. I am against the Proposal. More often than not when one of the planes go over they are so low that you can see the pilot and read the writing on the plane. It doesn't happen all the time but I have experienced being "buzzed" in my home & auto. AM-14

The proposed area is more sparsely populated than other areas but we are also the bread basket of the nation. LU-1

Whenever planes go over cattle and wildlife are spooked thus creating undue stress. We do not know SO-13

what the long term effects are but ranchers depend on these cattle for their livelihood. They can not afford to lose even one animal. The loss of even one animal also shortens the food supply to those who depend on getting their meat from the grocery store. SO-13

The planes fly all times of the day & when they do our houses vibrate & our windows rattle. The noise alone is annoying. NO-5

There has already been one bomber crash in this area and a life was lost. Who is to say that won't happen again and this time innocent bystanders are harmed. The other worry is the use of flares and chaff. Our area is prone to wildfires and area residents are always on the lookout for fires from lightening. It is not right to increase that load and make them have to watch for fires from planes too. SA-20 SA-5

The last comment I have is this. If there is no danger to the public or livestock ~~by~~ from these fly-bys why don't you fly over Rapid City or over the Badlands of South Dakota? The Badlands are more like ~~the~~ Afghanistan than we are. It is not right that since our area is sparsely populated that we should be subjected to this air & noise pollution either. Our land & air is just as valueable to us as a highrise in the city is valueable to them, and the loss of any livestock, etc affects not just us but the whole nation. PN-2 LU-2

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms DeVine:

I am writing to you as a member of the Minot Area Chamber of Commerce and as a longtime resident of North Dakota.

After reviewing the draft environmental impact statement (EIS) for expansion of the Powder River Training Complex, I support the preferred Alternative identified. I support this alternative for a number of reasons. First, the proximity of the training complex would allow the airmen flying the B-52 to train in a manner similar to real world situations. In addition, the proximity of the training complex would reduce training costs in a time when budgets will continue to be tight and training is a necessity for our airmen. Finally, the proximity to the training complex would also mean a higher quality of life for the airmen and their families because of less time away from home because of TDY on training exercises.

GE-1

I understand the concerns identified by some of the landowners located in and around the Powder River Complex. However, I believe those concerns can be mitigated by identifying avoidance zones similar to those identified for Native American sacred grounds.

NO-10

I appreciate the opportunity to support the preferred alternative identified in the draft EIS for the expanded Powder River Training Complex.

Respectfully,

Richard F. White

1111

Steve and Janelle Rieger

Nov. 11, 2010

Comments on the proposed Powder River Training Complex:

We oppose the expansion of the present Powder River Training Area. We have lived under one before and do not care to again. We were here first; this is our land and life and we do not feel that you should be able to impose on it just because you want to. GE-2 LU-1

Scares animals including humans. Low flying planes do scare livestock including dogs. We lived under a fly zone for awhile and though it did not bother the cattle in the pasture those locked up were apt to run. We lock our calves up when we wean and it does not take much to make them run and smash into a fence resulting in broken necks, knocked out eyes and other life altering or ending injuries. There are enough scary things out here; we do not need the added worry of low flying planes stampeding them. SO-13

I have known more then one person that has leapt off a swather or other machinery fearing it was going to come to pieces only to realize it was a bomber going over. One of them was me and I did not enjoy the "rush" I got thinking the swather was dying a noisy death and I better get away from it. NO-2

One sonic boom can send a good cow dog into hiding for the rest of the day. I think the chickens and turkeys reacted most to the planes. It looked like a huge chicken hawk to them. So I know it is a fact that both animals and humans are startled by the sound of a plane traveling so low over head. BI-4

Property values. Have any studies been done on property values? I do know we will soon be selling our place and looking at semi retirement on a smaller place. What a bummer if this fly area affects the price we should get for our land. I know that I will check for fly areas when we buy land and I will shun any with a military airspace overhead. I doubt I am the only one that feels that way. SO-1

Noise pollution. This is still cowboy country and I love riding with only nature to break the silence. I do not enjoy listening to airplanes. I do not want them intruding on my thoughts. I do not want them flying overhead when I am trying to talk to a friend. I DO NOT WANT THEM PEROD. LU-2

Local aviation. I always wanted to learn to fly and now finally we might be able to spare the money. (Some good things come with age!) If you win the right to fly over us willy nilly and we have to ask permission or try to be aware of your activities in the area every time we fly that will take away the freedom and enjoyment that a person should get out of flying. I am not sure I understand the see and avoid. Are you going to avoid us or do we have to avoid you? "See and avoid" has to work both ways. Is your pilot going to see me and think "oh my gosh this is a novice pilot she does not know where to go I better avoid her" or is it "I am here, I am bigger, get out of my way." You being able to put restrictions on when and where we can fly is not right. There are too many rules now. AM-12 SA-7

Plenty of other space to practice. I have looked it up and you have lots of other air space to practice in. There are also huge oceans out there with no one living under the sky. Go as low as you want whenever you want. See and avoid the ships. Move Ellsworth Air Force Base, take it to federally owned land—all that desert down south. PN-2

Eastern Montana is sparsely populated and that makes us one of the "last best places" it also makes us easy to over run with no regard to our lifestyles. LU-1

I repeat we oppose this expansion. GE-2

It is not possible to make every body happy. I think that the present world situation with the enemies abroad that we have makes a strong defence necessary. As a combat veteran, I see the need that in todays world with the sophisticated enemy that we have, and the Technology that we have, making the training of our young soldiers, airmen and sailors at a very high priority that we as citizens need realize that some inconvinience may become necessary for us.

We could we called into a full fleged war at any time. for us to send our young men in to this without proper training is to insure a death sentance to them. If we have done this in the past. let us learn from our mistakes. let us trust our professional officers to do the best job that they can do. They may not have all they are but let us give them enough

As a rancher I have had the least trouble with having low level flights. No problem. The radar site out at Miles City and the Bomb site at Forsyth - no problem.

I personally trust my brother citizens to do what they need to do to train our young men and to keep our military forces the best in the world.

The expansion of the proposed Powder River Training Complex will have several negative environmental impacts to Northwest South Dakota as demonstrated in the Draft Environmental Impact Statement. I am currently the Perkins County State's Attorney, serve as the City Attorney for the City of Lemmon and maintain my own private law practice in Lemmon, South Dakota. In addition, I have ranching interests in northeastern Perkins County.

One major environmental concern is the fact that the second largest body of water in a complex training area has been completely admitted from the Draft EIS Report.

Shadehill Reservoir is located at the confluence of the North Fork and South Fork of the Grand River, twelve miles south of Lemmon, South Dakota. Shadehill is used for recreation purposes and is a larger fishery. It is also a major stop for migratory waterfowl. How this large prairie lake has been omitted from the Draft EIS Surface Water Maps is perplexing. This reservoir has a storage of 100,057 acre feet. Shadehill Reservoir is the second largest lake in Western South Dakota in surface area and is the largest lake in a one hundred (100) mile radius.

BI-7

The noise level created by the craft and the expanded training complex will result in significant environmental impacts and disrupt ranching operations, along with other recreational businesses within the affected area. The air force has stated that there are no human health or safety risks due to the chaff that will be deposited on this land. Obviously, an outside substance such as this will have a significant impact on the enviroment. Additionally, on September 22, 1998, the GAO stated, "It found that the air force had been lacked in conducting further tests on the effects of chaff on animals and humans." It is apparent that more study needs to be done to determine whether or not this chaff will affect animals or humans.

LU-2

SA-27

This expansion will not only cause serious environmental impacts to private landowners but will also jeopardize the federal government's land holdings in this area. Grand River National Grasslands covers nearly 155,000 acres of prime grassland in Northwest South Dakota and is within the new boundary change of the Power River Training Complex. In addition, to the forest service land, there are also several thousands of acres of South Dakota Game, Fish and Parks Property, Bureau of Reclamation Property and Bureau of Land Management property. Until it can be determined that this training expansion will not cause any environmental detriment, whether it be chemical or sound, the Powder River Training Complex should not be expanded to include this area in Northwest South Dakota.

LU-1

One significant point that has not addressed in the Draft EIS is the fact the release of the chaff from these aircrafts will fall upon the ground that is often subject to downpours and spring melts which all create rapid flash flooding and would accumulate chaff in certain areas. While average rainfall is not significant in the expansion area, thunderstorms do produce flash flooding due to the amount of rain that falls and also due to the rapid changes in elevation. There also appears that there is no significant study on the effects of chaff in sheep's wool.

I have a few concerns regarding the accuracy and scientific integrity on B-1 aircraft noise predictions, particularly as they pertain to the Powder River Training Complex draft Environmental Impact Statement.] NO-3

(1) Ambient Noise Levels: Noise levels produced by high-altitude or long-range flight operations are typically under-predicted by both NoiseMap and, in this case, MR_NMap. Although derived from measurements included in NoiseFile records, the NoiseFile data were recorded at altitudes from 198 to only 1043 feet Above Ground Level (AGL), at lateral offsets up to 5000ft. Low-altitude high-speed noise measurements of the B-1B were made to correct known over-predictions experienced under military training routes. Over-predicted noise levels adversely affect high-performance aircraft operational frequency. Empirical corrections were implemented in MR_NMap.

Aircraft noise predictions are made using a 1000ft baseline reference spectrum. The methodology which over-predicts noise levels at altitudes below 1000ft, will under-predict noise levels at altitudes above 1000ft. Lacking an empirical basis above 1000ft, MR_NMap may not make scientifically well-founded prediction at high altitudes or long ranges. An openly published analysis of B-1B noise measurements using Training Route power setting was included in an AIAA Aeroacoustics conference paper 2006-2702, copy attached.

As such, affects of high-altitude aircraft operations on ambient noise levels are very likely underestimated in this (and other) EISs.] NO-3

(2) Low-level Startle Affects: The B-1Bs 500ft AGL SELs discussed in this EIS are directly related to the 472ft AGL measurements analyzed in the attached AIAA technical paper.] BI-4

Startle affects are an innate animal response to loud noises. Startle affects/responses in animals and humans are reduced through conditioned response. That is, as the animal's experience shows that the noise source is harmless, it tends to be less startled. Of course, this requires that loud noise sources (e.g. B-1B climb in afterburner) be confined to a fairly small area. Thus the environmental, animal and human response, impacts would be reduced to the extent that extremely loud operations are localized. This of course implies some sort of land-use agreement and perhaps compensation.] SO-1

Extent of Nonlinear Aeroacoustic Propagation from Single Frequency-Domain Measurements

Wayne R. Lundberg*
Aeroacoustician, Kettering, Ohio, 45420

The Simplified Nonlinear Aeroacoustic Propagation (SNAP) formulation was tested against published BAC 1-11 hushkit flight noise. Both aeroacoustic directivity and nonlinearity were found to influence the measurements. Aeroacoustic directivity effects have long been considered as a high-speed "forward flight effect." A survey of aeroacoustic directivity was conducted for a large high-speed aircraft with measurements at multiple altitudes. Significant departures from spherical spreading loss were documented. A brief assay of published NoiseMap reference spectra using third-octave band analysis for many aircraft at 325m altitude concluded that nonlinear propagation is common to aircraft with low bypass ratio engines during takeoff and evident in all flight operations using afterburner.

I. Introduction

RECENT studies of high-speed jet noise from flight,[1] ground runup[2] and facility[3] measurements have proven the existence of nonlinear acoustic propagation effects. Several different approaches to modeling the effect have been proposed.[4,5,6] However, development of a broad-band noise propagation model applicable to aeroacoustic sources has severe constraints owing to practical limitations stemming from previous operational noise measurement methods. This paper seeks to address the common practice of recording only frequency-domain third-octave band reference spectra at a single altitude.

Nonlinear propagation effects may be explicitly modeled as a waveform propagated in time.[6,7] This approach has been investigated for broadband aeroacoustic noise generated by the F-18E/F.[6] However accurate, propagation of a noise waveform is computationally intensive and thus infeasible for application in community noise models where very large numbers of flight operations are assessed. A time-domain approach also cannot predict the extent of nonlinear effects for sources with existing third-octave band noise measurements. Aircraft flight and rocket launch noise predictions are normally carried out in the frequency domain by propagating a measured (~325m reference) third-octave band noise spectrum over distance.

Recent field measurements studies of F-18E/F runups[2] were considered for analysis by the SNAP technique. Narrow-band analysis of the recordings was reported, even though aeroacoustic turbulence effects which might effect high frequency noise production were not found. Third-octave band spectra were not available for analysis.

The NoiseMap community noise model uses a duration correction coefficient approach[8] to modeling aeroacoustic directivity as a forward flight effect. High-speed flight decreases aircraft noise duration relative to spherical spreading losses generated by a general slow-moving source. A cumulative duration coefficient of 6 was derived from multiple aircraft noise measurements and applied to model aeroacoustic flight noise. Spherical spreading loss would produce a duration correction coefficient of 10. A direct comparative analysis using flight noise measurements from the 1981 study was not possible. Directional spreading losses were computed from multi-altitude noise measurements from a large high-speed aircraft to document aeroacoustic directivity for further study.

The parameters of the SNAP model were previously characterized as predictable from the band 37 Sound Pressure Level (SPL) of the measured source spectrum.[5] These preliminary results were used to produce formulas for the three parameters of the exponential function relating effective source radius (or equivalently, band 37 SPL) to the arrays of relative amplitudes. An established family of such functions makes prediction of the extent of nonlinearity for sources of any intensity possible. The functional relationships which were derived to characterize nonlinear and aeroacoustic directivity from aerospace sources having multiple-range measurements could not be tested or further refined in this study due to administrative problems which caused technical difficulties. However, it was possible to assess what types of aircraft operations are influenced by the nonlinear propagation effect.

II. Application of SNAP to Existing Multi-Altitude Spectra

The SNAP model was applied to existing flight noise measurements of the BAC 1-11 with a six-chute hushkit (meteorological and flight noise data used with permission of G. P. Howell).[9]

The SNAP parameters were adjusted to yield a good (but not analytically 'best') fit to the measured third-octave band spectra at 406.9m and 905.6m and above 5kHz. The coefficient of spreading loss was also adjusted to yield a good fit to measurements near 1kHz. The results are shown in Figure 1.

Further analysis of the inter-relationship between SNAP model parameters for aeroacoustic directivity and nonlinearity was conducted using flight noise measurements from another small high-performance aircraft. Directional losses with spreading loss exponent of 1.5 – 3.0 were shown to influence the nonlinear relative amplitudes.

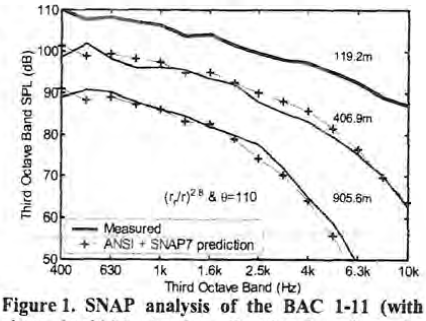

Figure 1. SNAP analysis of the BAC 1-11 (with 6-chute hushkit) showing directional and nonlinear propagation.

III. Aeroacoustic Directivity for Large Aircraft

An exploration of the extent of aeroacoustic directivity was conducted for the B-1B aircraft. The B-1B in Training Route power produces little noise in the high-frequency range that is usually associated with nonlinear propagation effects.

The B-1B has four low-bypass turbofan engines installed in pairs separated by many nozzle diameters. The directional propagation of this large aircraft's flight noise is influenced by the Raleigh distance required for these sources to merge as well as by the aeroacoustic directivity of individual jet noise.

Acoustic merging is evidenced by a nearly cylindrical spreading loss coefficient near vertical propagation (Figure 2). Aeroacoustic directivity is evidenced by rapid transition to a spreading loss coefficient of ~3 near 130 degrees emission angle (Figure 4).

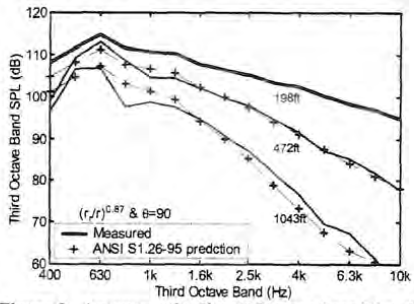

Figure 2. Aeroacoustic directivity produced by the B-1B in high-speed flight, at 90 degrees emission.

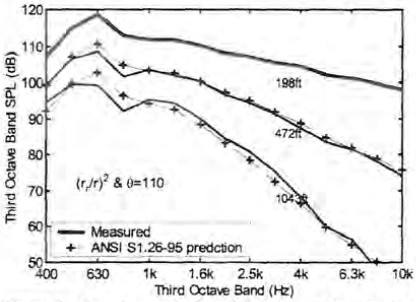

Figure 3. Aeroacoustic directivity produced by the B-1B in high-speed flight, at 110 degrees emission.

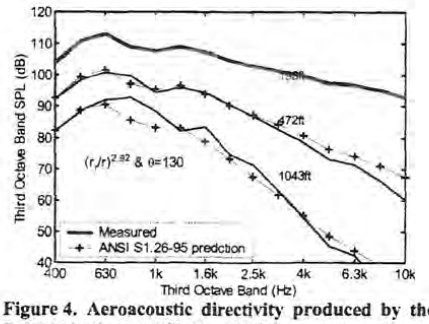

Figure 4. Aeroacoustic directivity produced by the B-1B in high-speed flight, at 130 degrees emission.

IV. Estimation of Extent of Nonlinearity from Single Frequency-Domain Measurements

Functional relationships between SNAP model parameters and the band 37 SPL were proposed to characterize the threshold and extent of nonlinear propagation.[5] The threshold of nonlinearity was estimated to be approximately 70 dB band 37 SPL.

Environmental noise prediction in the U.S. and many NATO countries is conducted with the NoiseMap community noise model. That model is based on aircraft flight reference spectra normalized to Standard Day conditions. These reference spectra are published as part of NoiseMap distribution and assessed here to determine whether nonlinear effects are present in existing community noise predictions.

The top four third-octave band SPLs for the loudest aircraft in the NoiseMap reference files are plotted in Figure 5. These partial spectra were rank-ordered according to their band 37 SPL values. Figure 5 includes F-18E/F Afterburner[6] flight noise data, but not the F-4C Training Route[1] dataset – which is ~3 dB below the quietest spectrum included.

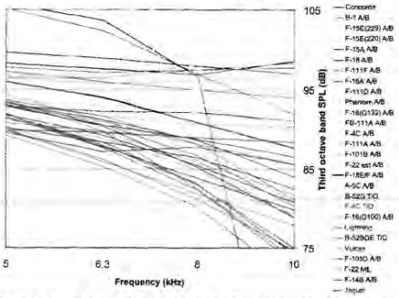

Figure 5. Noisefile reference spectra at the high-frequency third-octave bands influenced by nonlinear propagation.

V. Conclusions

Application of SNAP model results for prediction of the extent of nonlinearity in existing community noise model techniques demonstrates that nonlinear propagation effects are common to low-bypass turbofan engines in Takeoff power and occur in *all* aircraft flight operations using Afterburner. Only the SNAP approach has the capability to predict nonlinear aeroacoustic propagation where limited operational noise data exist.

Further, it was found that although aeroacoustic directivity effects are included in the NoiseMap duration correction, this effect of necessity varies according to airspeed, engine type and power setting – which are not treated as variables in existing community noise prediction models.

Acknowledgments

The author thanks the Air Force Research Laboratory, Human Effectiveness Directorate, Battlespace Acoustics Branch for providing flight noise data and Richard L. McKinley, Principal Engineer, for his encouragement.

Ms. Linda Devine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms. Devine:

I am writing in **opposition** of the proposed enormous expansion of the Powder River MOA.] GE-2

I own and operate a FAA part 135 charter operation based out of Helena, Montana. We routinely transport passengers and patients throughout Montana and nation wide on a daily basis so are intimately familiar with aircraft operations in and around MOA's.

I can tell you first hand that access into an active MOA while on an instrument flight plan is virtually impossible. The FAA my not have a policy against this but ATC will not clear you through this airspace while "active". This requires a reroute around the airspace costing valuable time and at great expense. In my opinion, VFR flight in an active MOA with supersonic aircraft is extremely risky and unsafe.] SO-7] SA-7

This expansion could essentially block off a huge portion of eastern Montana up to 240 days per year. This would affect not only air traffic in and out of the MOA but also over flight traffic as well.] AM-6

I also find it concerning that this proposed expansion has not been more widely publicized. This expansion will affect far more commercial operators, businesses and pilots than just those under the airspace in the proposed expansion.] NP-8

This expansion provides no positive economic benefit to Montana and will have a huge negative financial impact by limiting commerce and accessibility to these communities.] SO-24

Montana is already home to two existing MOA's.

Please **do not** allow the proposed expansion of the Powder River MOA.] GE-2

Sincerely

Dan Norhton
Owner

Expansion of the Air Force training area in Montana, Wyoming and South Dakota has been brought to my attention. I understand that an impact and environmental study had been made but if there is one I cannot find it. My name is Donald Merriman, my farm and livestock headquarters are immediately below the Shadehill Dam , 12 miles south of Lemmon South Dakota.

A few years ago a large hill on the south side of the Lake was used as a target by bombers from Ellsworth Air Force Base , some passes were so low and fast that they broke the sound barrier. This spooked cattle that I had in the feed lot causing them to break out. I complained to the commander at the Base near Rapid City , which brought a apology and inquiry as to how much damage had been caused . Fortunely no cattle died but a few planks wear broken which I did not put a claim in for damages. Being a WW2 veteran myself I know the necessity of training but told the commander I thought they could accomplish the goal without breaking the sound barrier. It never happened again. SD-13

Some of the concerns of ranchers seem to come from the supposed dropping of chaff and flares. Also that there might be flights lower than 500 feet above ground which could possibly cause problems with livestock such as I have mentioned. Apparently those who are making a request to expand the target area have done so without a comprehensive environmental assessment which is causing concern. I'm not involved on the farm anymore as my son has taken over the operation, I doubt as he even knows about this plan but he does know of the earlier problem we had. I sincerely hope that you will do a better job of informing those effected by this plan than has been to this date. Thank you Don Merriman [redacted] SA-27 AM-14 NP-1 NP-8

DEAR FOLKS:

I would like to go on the record as opposed to additional expansion of the Powder River Training Complex. GE-2

I have read the material and find little need to create this Additional AREA at the expense of so MANY. As ONE who travels via G.A. aircraft in that area on a regular basis, and can see where it will cause great interferance with operations of a civilian nature. I AM always very PN-2 AM-6 cautious in MOA area's & usually try to avoid them for the obvious reasons. This expansion however would cover such a large piece of real estate that it would

I am a rancher and president of the Multi-County Predator Control District, which includes Harding, Butte, Meade, & Lawrence Counties in South Dakota. My livelihood and the livelihoods of all the ranches in this district are dependent on the use of aircraft to control predators to keep them from killing our livestock. Our pilots fly 200 hrs per year and kill about 500 predators per year. We are assisted by an airplane from APHIS Wildlife Services which flies about 700 hrs per year and kills several hundred more predators per year. Even with all these efforts we still incur livestock loss due to predators. Over SD-15

With this expansion that is proposed our ability to protect our livestock and livlihoods is going to be negatively impacted. If anyone of our producers is loosing livestock and the pilots can't fly due to a large force exercise with their ability to come down to 500 ft above ground level the cost in lost revenue to a rancher may be devestating. SO-15

There are over 300 aircraft registered in the South Dakota counties to be under this Training Complex. All of these general aviation aircraft are going to be affected at some time by these training exercises. This needs to be considered in all states affected by this. SO-5

Another concern is the Sage Grouse. This species is being considered to be placed on the Endangered Species list. If these exercises negatively effect these birds it will be a terrible blow to this area. In the 1960's and early 1970's we experienced sonic booms from military aircraft in this area. At the time I remember newspaper articles saying these booms were affecting the nesting success of the Sage Grouse. I don't know if any studies were done on this and other birds but some need to be done before this proceeds. BI-3

If this expansion causes the Sage Grouse or any other species to be listed as endangered it will alter grazing practices and probably have other impacts that will lower property values and incomes in an industry that is barely hanging on now. SO-27 SO-1

Dear Ms. Devine;
I have Called Gus Malonus in Seattle repeatedly about the trains blowing their Whistles from the edge of town all the Way through. All of the engineers don't, but Most do all day & all nite. I live about a block from the tracks & when the train is going through I can't even hear my T.V. We have about a 100 trains a day. They are supposed to blow 3 short blasts before each Crossing. Gillette, upton, & Osage have a Whistle free Zones in their towns, how Can We get that here. My dog just howls because it hurts her ears so bad & it hurts mine too, then there are people who live right beside the track. I don't think it's fair to them to be exposed to this either. Thank you for any help you Can provide

Sincerely
Carol M. Wolfe

9-14-10

POWDER RIVER EIS PUBLIC HEARING

BEFORE: COLONEL RON GREGORY - HEARING OFFICER

DATE: September 14, 2010 at 6:00 p.m.

PLACE: Holiday Inn
505 North 5th Street
Rapid City, South Dakota

A P P E A R A N C E S

COLONEL JEFFREY TALIAFERRO
Commander of the 28th Bomb Wing
Ellsworth Air Force Base, South Dakota

MS. LINDA DeVINE
on behalf of Headquarters
Air Combat Command
Langley Air Force Base, Virginia

Reported By: Cindy K. Pfingston, RPR
Registered Professional Reporter
Apex Court Reporting
(605) 877-1806

P R O C E E D I N G S

THE HEARING OFFICER: Good evening and welcome to the public hearing for the Powder River Training Complex Environmental Impact Statement or "EIS". I'm

9-14-10

Colonel Ron Gregory. I'll be your hearing officer tonight. I'm a military judge on the Air Force Court of Criminal Appeals based in D.C. I'm not assigned to Ellsworth Air Force Base or air combat command. My job is to review trials by court martial that are taken up on appeal in criminal cases. I'm also not here as a legal advisor to the air force representatives for this proposal tonight. My role as the hearing officer is simply to ensure that we have a fair, orderly and an impartial hearing and to provide you folks an opportunity to provide comments. In summary, I'm essentially just the moderator, an impartial moderator for this hearing tonight. And before we begin, I'd just remind you if you could turn off your cell phones, pagers or at least put them where they're on that vibrate mode so they don't ring during the presentations.

We're here tonight because the air force is analyzing the environmental impacts of the proposed expansion of the Powder River air space. Tonight

3

the air force will present information on the Powder River Training Complex EIS and a project description. The air force will also discuss the environmental impact analysis process.

This hearing is being held in accordance with the provisions of the National Environmental Policy Act and the regulations that are published by the council on environmental quality. The purpose of this hearing is to receive your comments on the

Page 2

9-14-10

draft Environmental Impact Statement.

Before we begin with the presentation, I'd like to note that representatives from headquarters, air combat command, Ellsworth Air Force Base and the Federal Aviation Administration, all of whom are involved in this project, are present tonight.

I'd like to introduce Mr. Roger McGrath from the FAA. He's the representative attending the hearing tonight, and he's the fellow raising his hand in the back there.

The hearing will be conducted in two parts. First, Colonel Jeffrey Taliaferro, Commander of the 28th Bomb Wing here at Ellsworth Air Force Base, will make a presentation on the proposed action and the alternatives. Then Ms. Linda DeVine from Headquarters Air Combat Command at Langley Air Force

4

Base in Virginia will provide an overview of the National Environmental Policy Act or NEPA, as well as summarize the potential environmental consequences of the proposal.

The second part of this hearing will be your opportunity to provide comments and statements for the record. The input that you give will provide the decision-makers for the Powder River Training Complex Proposal the benefit of your knowledge of the local area and your concerns about the environmental analysis.

The public hearing serves as just one of several opportunities for public comment. Throughout this hearing please keep in mind that this public hearing is not a debate; it's not a vote

Page 3

9-14-10

on the draft EIS, nor is it primarily designed as just a question-and-answer session.

The hearing is about the adequacy of the environmental analysis and the potential environmental impacts associated with the proposal being studied by the air force and the FAA as a cooperating agency. Concerns related to the National Historic Preservation Act, Section 106 consultation process are also welcome. However, concerns about other non-environmental issues should

5

not be raised at the hearing since they will not add to the decision-making process and will simply take away time from the other attendees' opportunity to comment.

To ensure the accuracy and full documentation of the hearing we have a stenographer, Cindy Pfingston, sitting over here to my right who is taking all of this down. Again, you'll be making your comments after the air force presentation, and I'll provide you this microphone. Come down front and I'll hand you the mike, and you can make your comments. And, again, they'll all be transcribed.

If you'd like to provide your comments in writing, written comment sheets are available at the registration table for your use. You can turn these sheets in at the end of the evening, or you can mail or fax them later at your convenience. If you mail your comments or fax them, send them to the address shown on the slide. The address is also printed on the brochure and the comment sheets.

Page 4

9-14-10

The air force will consider comments throughout the environmental impact analysis process. To make sure your comments are considered and documented in the final EIS though, please submit your comments by November the 15th, 2010.

6

I'd now like to turn the presentation over to Colonel Taliaferro who will provide you specific details on the proposal.

Colonel?

COLONEL TALIAFERRO: All right, thanks a lot.

Great to see a lot of our neighbors here today, a lot of folks that we've already had a chance to meet. And if while not really a part of this presentation or this process, if you'd like to talk to me after, I'll stay after outside and answer any personal questions you may have for me.

As we mentioned, I'm Colonel Jeff Taliaferro. I'm the Commander of the 28th Bomb Wing. And in Ellsworth parlance or air force parlance, I'm the installation or base commander at Ellsworth Air Force Base.

First I'll review the existing air space and its limitations with respect to -- oh, I'm sorry, let me back up.

I'm here to explain the proposed expansion of Ellsworth Air Force Base's Powder River military training airspace.

The purpose of the proposed Powder River Training Complex is to provide local airspace that would support primarily Ellsworth and Minot Air

7

9-14-10

Force Bases with the capability necessary to adequately train aircrews and ensure their readinesses to succeed and survive in combat.

First, I will review the existing airspace and its limitations with respect to our current training requirement to support overseas combat operations.

Second, I'll discuss the Powder River Training Complex proposal, its advantages, why it is needed, and how we are addressing common concerns of the proposal.

The current Powder River military training airspace, as depicted on this chart, sits just northwest of Rapid City and Ellsworth Air Force Base. The airspace covers about 9,748 square miles. It's located over portions of South Dakota, Wyoming, and Montana. The lowest altitude we currently fly is 500 feet above the ground, and the highest altitude is flight level 450 (or about 45,000 feet).

The current airspace encompasses six private and seven public airfields supporting over a hundred registered light aircraft. Today, in the Powder River airspace, military aircraft must avoid FAA charted airports by 1,500 feet and 3 nautical miles. Known private airstrips uncharted by the FAA are avoided by a thousand feet and one nautical mile.

8

Residents living under the Powder River airspace may request that Ellsworth Air Force Base's airspace manager temporarily restrict overflight of areas sensitive to noise, such as acreage utilized during calving seasons, or cultural and traditional

Page 6

9-14-10
ceremonies. Currently, 17 noise-sensitive areas are charted and avoided by military aircraft flying in the Powder River airspace. And you can see that on this chart with the red circles on the map.

The proposed expansion would nearly quadruple the airspace available for combat training, depicted on this chart in blue. Just like the current Powder River airspace, depicted on the chart in black, the flight altitudes are proposed to remain 500 feet above the ground level to at least as high as flight level 450 or 45,000 feet above mean sea level. Under the proposed action, the airspace would cover about 12 private and 19 public airfields. The public and private airfields would remain protected as they are now. Noise-sensitive areas would also continue to be avoided.

During a typical flying day, aircraft from Ellsworth Air Force Base, South Dakota, Minot Air Force Base, North Dakota and Offutt Air Force Base, Nebraska, use the existing airspace. Currently

9

flight training operations are generally conducted from 9:00 a.m. to midnight, Monday through Friday. Occasionally, the airspace is used on the weekends or at later times. The majority of this flight time is flown above 18,000 feet. Under this proposal the air force would not regularly schedule training in the proposed airspace weekday afternoons (noon to 6:00) or weekends (noon Friday through to 7:30 a.m. Monday). When training is needed, though, during those hours, the air force would schedule the airspace with the FAA, and the public would be

Page 7

9-14-10

notified of this by NOTAM (or Notice to Airmen), just as we do today in the current airspace.

The proposed expansion would provide the airspace needed to conduct local realistic training for Ellsworth and Minot aircrews.

U.S. Air Force flight crews have used the Powder River airspace since the 1980s. As seen on this chart in red, the routes used then crisscrossed the area of the proposed expansion and were predominantly low-level routes. They were designed in the 1980s to ensure bomber crews were prepared to employ nuclear weapons. Many are no longer used and since have been decommissioned.

The current Powder River airspace was a part of

10

this network of training routes. It's been used extensively since the 1980s with only a single military aircraft crash in 1997. This accident did not harm any civilians. Military crews using the Powder River airspace have maintained an outstanding safety record. During this period there were zero hazardous air traffic reports, zero high accident potential reports, zero traffic collision avoidance system resolutions, zero air traffic control violations, and zero mid-air collisions.

Over the last two decades, the mission of the U.S. Air Force has evolved significantly. For bomber operations, the mission has changed drastically to the point that the current Powder River airspace has inadequate space and diversity to accommodate necessary B-1 and B-52 training

Page 8

9-14-10

requirements for combat.

The current airspace and low level routes permit a single aircraft, or a single two-aircraft formation, to practice low altitude attacks into simulated air defenses. However, today's combat operations require bomber crews to roam vast areas and to quickly respond with a variety of weapons to support ground troops spread across entire countries. As this slide shows, the expansion

11

airspace better permits this type of training to prepare our aircrews for combat in Afghanistan.

Additionally, we must train against a variety of emerging threats. These threats range from insurgent fighters employing guerrilla tactics with conventional weapons to an adversary employing a large military with advanced fighter aircraft and long-range state-of-the-art radar and missile defenses. 25 years ago our forces traditionally faced surface-to-air threats that reached out 20 to 30 miles, and we employed bombs from less than a mile away from the target. Today these same types of threats range hundreds of miles, and our aircraft deploy and employ weapons across similar distances.

Realistically simulating a battle environment requires a near four-fold increase in airspace and the use of chaff and flare countermeasures. Limited supersonic flight would also be needed approximately ten days a year.

The proposed airspace increase from one local training area to four local training areas would allow multiple aircraft, or formations of aircraft,

Page 9

9-14-10

to utilize individual training areas simultaneously. This would increase the flexibility and training opportunity for our aircrews. In particular, this

12

would be very advantageous for Ellsworth Air Force B-1 crews and Minot Air Force Base B-52 crews, as the airspace could support up to 85 percent of their required training events.

Today the size of Powder River airspace is useful for only about 46 percent of B-1 aircrew missions and 31 percent of B-52 aircrew training sorties. However, due to the proximity of Powder River to Ellsworth Air Force Base, aircraft missions that utilize the airspace are able to complete their training and return to base quickly enough to allow that same aircraft to be flown again, by another crew, that same day. If the additional airspace, as proposed, was available, this capability would significantly increase the B-1 training opportunities and the rate at which Ellsworth Air Force Base squadrons could produce combat-ready aircrew.

The Powder River Training Complex expansion would allow supersonic flight during large force exercises, which are proposed to take place approximately ten days per year, and the release of chaff and flares during daily flight activity. Training aircrews would use the electronic scoring site located near Colony, Wyoming that simulates

13

surface-to-air missiles and anti-aircraft artillery,

Page 10

as well as several heated ground targets. It's important to note that neither the current Powder River airspace nor the proposed airspace expansion include a live bombing range. In other words, we will not be dropping either live or inert bombs onto the ground under the proposed, and we don't do it under the current airspace either.

The size and sectioning of the proposed airspace expansion would also permit more effective scheduling. Much like grazing or crop rotation, military schedulers can activate only the portions of the complex required to support flying activities and only for the block of time needed. Additionally, with four sectors, schedulers would be able to activate more than one area at a time which it could increase the amount of training that can be conducted within Powder River simultaneously.

It's also important to note that neither the current, nor the proposed Powder River airspace contains restricted airspace. Although it's prudent to de-conflict civilian and military training flights, civilian aircraft flying under visual flight rules may legally fly through the Powder River airspace at any time. Aircraft operating

under instrument flight rules would continue to be controlled by one of three FAA air traffic control centers and kept clear of military aircraft. As it is today, information on Powder River activity will continue to be readily available using any one of the Federal Aviation Administration Websites or by checking Notices to Airmen on-line or by telephone

9-14-10

or by radio through the FAA-controlling agency or flight service station. These procedures have proven effective in the current Powder River airspace for more than 20 years.

To minimize the impact on general and commercial aviation, the proposed airspace design includes transition corridors that would lie between each of the primary airspaces. During normal day-to-day operations these transition corridors would remain open for civil aviation. During infrequent large force exercises, some or all of the corridors may be temporarily activated. The ability to combine the airspace segments would provide flight crews the opportunity to train against a realistic simulation of an adversary employing advanced fighter aircraft using long-range radar and sensors, or simulated state-of-the-art surface-to-air missile capability.

15

During the scoping process for this proposed action several concerns were raised. First, there were concerns for the safety and restrictions on use of the airspace by general aviation. To address this concern the air force, in cooperation with the FAA, modified the proposed action and alternatives to minimize impacts to the existing air corridors, victor routes, and airports. As a result, all existing victor routes would remain unaffected, except during large force exercises. Also, the Powder River 1 military operating area, that's the -- well, we don't have a chart up there, but

Page 12

9-14-10
it's the one furthest to the west, was redrawn to minimize impacts to an airway that ran through the originally proposed western boundary. In addition, the buffer zones around some of the regional airports in the area were also increased.

Another concern was any limitation on activities such as Life Flight or aerial firefighting. In accordance with FAA regulations, Life Flight and aerial firefighting would retain their priority over military training missions. In the event of a wildfire, a temporary flight restriction would activate over the affected area and no military training operations would occur.

16

The current memorandum of understanding between Ellsworth Air Force Base and the Bureau of Land Management on file in Miles City, Montana would continue to regulate the de-confliction of military and firefighting operations in the Powder River Training Complex. In the proposed areas of expansion, the air force would also work to establish similar agreements with the appropriate agencies.

With respect to concerns about noise pollution, the Ellsworth Air Force Base airspace manager and unit schedulers already enact procedures to ensure minimal disruption of ranching, population centers, and other activities due to aircraft noise. The current processes and organizations would oversee the Powder River Training Complex in the same manner.

The potential for additional noise from

Page 13

9-14-10

supersonic flight was mitigated by two restrictions. First, supersonic flight will only be authorized during infrequent large force exercises and will not be authorized for day-to-day training. Second, during large force exercises, fighter aircraft would be limited to supersonic flight above 10,000 feet above ground level, and B-1 aircraft would be

17

limited to supersonic flight above 20,000 feet mean sea level.

Another concern has been the proposed addition of chaff and flare training. Modern chaff, known as "angel hair" chaff, is thinner than a fine human hair, normally shorter than one inch in length and consists of small amounts of silicon based material that would scatter prior to reaching the ground. While in the air, these very fine filaments are used to create radar interference in order to decoy enemy radar. Once on the ground, chaff rapidly degrades and becomes indiscernible from naturally occurring silica and aluminum soil materials. Modern chaff poses no threat to humans, livestock or any infrastructure such as power transmission lines or sub-stations.

Flares are designed to decoy heat-seeking missiles. They would be used only with appropriate limitations to minimize the fire hazard. They would not be used below 2,000 feet above ground level. Flares burn out by the time they fall about 500 feet. Flares would also not be deployed over areas where the national fire danger rating system

Page 14

9-14-10
has issued an extreme fire danger rating.
Altogether, B-1 training chaff and flares have
18

been used for years in the military operating areas near Las Vegas, Salt Lake City and Mountain Home, Idaho without distress to the environment.

Finally, some are concerned about the airspace's impact on existing or new commercial enterprises such as wind turbines or mining operations. Any vertical obstructions above 200 feet, such as communications towers or larger wind turbines, require evaluation by the Federal Aviation Administration's Obstruction Evaluation/Airport Airspace Analysis Process. Each would be considered by the FAA on a case-by-case basis. The U.S. Air Force may be consulted, but the air force does not have authority to disapprove construction on private property. If a commercial structure becomes a factor to the airspace due to its height, it would be charted and avoided just as they are today.

Work to expand the Powder River Training Complex began in 2005 and is governed by the National Environmental Policy Act. The process takes many years. It started with a validated military necessity. This necessity is weighed against environmental and public concerns.

In July of 2010, the U.S. Air Force submitted a formal proposal for the expansion to the Federal
19

Aviation Administration. The draft Environmental Impact Statement was, of course, published in August of this year, starting the public comment period.
Page 15

9-14-10

After the public comments from these hearings are documented and addressed, the final Environmental Impact Statement will be released. This release is estimated to occur in the summer of 2011. The goal is to have a decision on the Powder River Training Complex airspace by Fall of 2011.

In closing, this airspace expansion will greatly improve the training of our U.S. Air Force airmen as they prepare to confront threats facing our nation. Just as enemy threats and capabilities have evolved over time, our training environment must also change so we can realistically prepare to face them.

Okay. Well, thanks for your attention, and now I'll turn it back over to Ms. Linda DeVine to talk more about the NEPA process. And, again, I'll be staying after if you have any individual questions you'd like to ask me. Thanks.

MS. DeVINE: Thank you, Colonel Taliaferro.

Good evening. I'm Linda DeVine. I'm from headquarters air combat command at Langley Air Force Base, Virginia. I'm the Environmental Impact

20

Analysis process manager for this project. I am here tonight to discuss the National Environmental Policy Act or "NEPA" and the Environmental Impact Analysis process.

The National Environmental Policy Act is our national charter for the protection of the environment. Basically, it requires federal agencies to analyze the potential environmental

Page 16

9-14-10

consequences of a proposed action and reasonable alternatives, including a no-action alternative before any action is taken. The proposed action just presented is the air force's preferred alternative. Alternative A best meets the purpose and need by providing four combinations of military operations areas and air traffic control assigned airspaces.

Alternatives B and C each provide three combinations of airspace but provide fewer areas for training. Under Alternative B, the Powder River 4 MOA Operations Area, or MOA, would not be charted. The Military Operations Area is represented on this slide as PR 4. In Alternative C, the Powder River 1 MOAs would not be charted. Alternative B is superior to Alternative C because it includes the Powder River 1 MOAs. The Powder River 1 MOAs are

21

the only airspaces proposed over terrain that would meet B-1 terrain following requirements.

The no-action alternative simply analyzes the environmental impacts of keeping the airspace configuration in its existing state. It provides the benchmark for comparing the effects of other action alternatives.

The National Environmental Policy Act also provides opportunities for public involvement. By being here tonight, you are participants in that process. The goal of the National Environmental Policy Act is to make good decisions, and by involving the public in the process, we try to balance our air force requirements with the

Page 17

9-14-10

community and environment. Your input into the process helps us make the most informed decisions possible.

As you can see, there are several key steps to this Environmental Impact Analysis process. We are currently at the public and agency review stage. Copies of the draft EIS were mailed in mid-August to state and federal representatives and individuals who requested copies. Postcards were mailed to all other parties who had expressed an interest in the proposed action.

22

During this phase of public involvement, we are providing you the opportunity to review and comment on the draft Environmental Impact Statement. This public hearing is a part of that process. It provides the public an opportunity to learn about the proposed action, the potential environmental impacts, and to provide comments on the draft EIS.

As part of the public comment phase, we have scheduled 19 public hearings in areas we felt we could reach the largest number of interested and concerned citizens. A copy of the hearing schedule is available at the reception table.

At the end of the public comment period, we will combine public and agency input received at this public hearing with the inputs we receive through the mail and use it to prepare a final Environmental Impact Statement.

Once the final Environmental Impact Statement is complete, it will be distributed in the same

Page 18

9-14-10

manner as the draft EIS, and after a 30-day waiting period, a record of decision will be signed by the air force documenting which of the four alternatives the air force selects for implementation.

The Federal Aviation Administration has the same requirements under the National Environmental

23

Policy Act as other federal government agencies, and for this proposed action, the Federal Aviation Administration is participating in the Environmental Impact Analysis process as a cooperating agency. The FAA has the overall authority for charting new airspace and before any airspace can be charted, they may either accept the air force's Environmental Impact Statement and sign their own record of decision, or complete their own Environmental Impact Statement.

The scoping process, including meetings held in 2008, in which you may have provided input, led us to revise the proposed action and alternatives and helped us focus our analysis. This demonstrates that your comments are important. Once all alternatives were defined, the air force prepared a draft Environmental Impact Statement analyzing the resources having the potential of being affected by the proposed action or alternatives. The draft Environmental Impact Statement includes the purpose and need for the action, a description of the proposed action, and alternatives or the who, what, when, where and why of the action, a description of the existing environment, and an analysis of the potential environmental effects to the airspace,

Page 19

human, cultural and natural environment.

Let's briefly look at some of the results from the EIS preferred alternative regarding those environmental resource areas.

One of the greatest concerns identified during the scoping phase dealt with impacts to airspace management, air traffic, and flight safety. After initial analysis, and in direct response to concerns identified, the air force and FAA worked together to revise the proposed action to minimize impacts as described by Colonel Taliaferro. Based on the revised proposal, an estimated 129 daily civilian operations could be impacted through ground holds/diversions or needing to fly VFR see-and-avoid in an active MOA. Pilots choosing not to fly in an active MOA would have to reschedule to fly in that airspace when the MOA is not active. By limiting daily activation of the MOAs during the afternoon hours and on Saturdays, the air force would minimize some of these effects.

Life Flight and other emergency operations would not be impacted as they would be given priority in the airspace just as they are today.

Wake vortices or air disturbances from large aircraft could potentially impact light aircraft

flying through the wake of a low-flying bomber. Because atmospheric conditions and winds common to this region of influence cause wake vortices to decay and dissipate quickly, there's an unlikely

9-14-10

potential for this to occur, and there are no recorded cases of wake vortex impacts in the existing Powder River airspace.

Large-force exercises are proposed once per quarter for one to three days, a maximum of ten days per year. These exercises would be publicized in advance, and most training would take place below 26,000 feet mean sea level. Most large-force exercise training would not impact jet routes. However, some would have the potential to significantly impact between 43 and 244 high-altitude commercial flights. To reduce impacts, large-force exercise training in air traffic control assigned airspace for the airspace above 18,000 feet would be scheduled by the Federal Aviation Administration.

Aircraft noise was also identified as a concern during scoping due to the proposed low-altitude overflights and supersonic operations. In general, the day-night average sound level, or the ambient noise level that you experience today would be

26

similar to that expected under the proposed action, with only minimal changes caused by military overflights. However, any location under the proposed airspace could expect to experience individual aircraft overflights below 2,000 feet between six and nine times per year. These high-speed low-altitude aircraft can produce sound exposure levels greater than a hundred decibels, and the sudden onset can be startling to humans and animals, and could cause domestic animals, such as

Page 21

9-14-10

horses and cattle, to spook, especially when penned. To minimize potential safety risks, temporary or long-term avoidance areas similar to those currently in place would be established.

With respect to supersonic flights, which are now proposed only during quarterly large-force exercises, approximately one sonic boom per day could be experienced at any given location on the ground. Most sonic booms would be heard as thunder; although, some could be experienced as a sharp crack-crack. Household items balanced on shelves, edges, such as mantels or bookcases, could fall and break due to vibrations caused by sonic booms. Structural elements of homes and buildings, normally in good condition, would not be expected to fail. 27

No significant impacts are expected to air quality, soil or water resources. B-1, B-52 training would not produce enough emissions to affect air quality or visibility. No ground-disturbing activities are proposed. Residual materials generated from chaff and flare use are inert and would not be in sufficient quantities to affect soil or water resources.

An incidental bird/aircraft strike hazard could occur with endangered species such as the piping plover, whooping crane or interior least tern. These birds are migratory through the area, and the air force implements seasonal avoidance areas to reduce the potential for bird-aircraft strikes. Therefore, the proposed action is not likely to

Page 22

9-14-10

adversely affect the population. No effect would be expected to other protected or special status species. Some startle effects could be expected as wild or domestic animals are startled by an infrequent random overflight, but significant impacts would not be expected. The potential for a fire to be caused from the flares is minimal because flare use would burn out within 500 feet of release from an aircraft, and flare use would only be permitted above 2,000 feet above ground level.

28

Also, flare use would be discontinued under extreme fire conditions.

The analysis identified many cultural and historic sites beneath the proposed airspace.

The estimated average of six to nine low-level overflights and ten sonic booms per year would not be expected to be seen as a significant impact to national monuments or historic landmarks; although, visitors could be annoyed by the intrusion. Two of the sites within the Little Bighorn Battlefield currently have overflight restrictions below 2,000 feet above ground level, and locations such as Devil's Tower, Bear Butte and Deadwood would not be overflown at altitudes below 18,000 feet mean sea level.

The air force is engaged in National Historic Preservation Act Section 106 consultation with the state historic preservation officers and tribes. And copies of the comments received at these public hearings would be made available to them as part of that process.

Page 23

9-14-10

Many of these sites are also traditional cultural properties, and any change in settings created by increased noise, sonic booms or visual intrusions could be considered an adverse impact 29

upon tribal ceremonies and quests.

The air force would establish reasonable temporary or seasonal avoidance areas or could adopt other measures identified in government-to-government consultation with affected tribes to reduce intrusive impacts.

There is a potential for economic impacts from flight delays and potential routings of IFR traffic around an active MOA or air traffic control assigned airspace which is above 18,000 feet. The stratified airspace is designed to be more compatible with IFR traffic and minimize these impacts.

No land use or property value impacts would be anticipated from flight operations, and no ground-disturbing actions are included in the proposed action.

Altitude overflight restrictions would be established over tall structures such as tall construction cranes, power plant stacks and wind farms. Coordination would be required between mine operators and the air force to ensure that radio frequencies used for mining are not used by air force aircraft during training.

Intermittent low-altitude flight would not be expected to significantly impact recreational 30

Page 24

9-14-10

activities or interfere with hunting. However, should an overflight be experienced, an individual could become annoyed. The air force would not normally train on weekends, and this would somewhat reduce potential impacts on recreationists.

Environmental justice applies when there is a potential for disproportionately high and adverse human health or environmental effects to minorities, low-income populations, or children.

Powder River 1A and B MOAs have the greatest potential for disproportionate impacts. Powder River 1A lies above an area that has a greater proportion of minority and low-income populations and children than any other area beneath the proposed airspace.

Cumulative effects consider the potential environmental impacts resulting from the incremental impacts of the Powder River Training Complex proposed action when added to other past, present and reasonably foreseeable actions, regardless of what agency or person undertakes such actions.

Air operations and cultural resources could be individually and cumulatively impacted by major energy and transportation development. The establishment of the Powder River Training Complex,

31

in combination with any other ongoing activities by federal or other agencies or enterprises, would not be expected to have incremental impacts.

This concludes the discussion of the potential impacts associated with the proposed action and alternatives.

Page 25

I would like to thank you for your participation in this Environmental Impact Analysis process and turn the floor back over to Colonel Gregory who will provide you with information on the second and most important part of tonight's public comment period.

Colonel Gregory?

THE HEARING OFFICER: All right. Thanks.

All right. Let's go ahead and move into the public comment part of this hearing tonight. I'll call the names of those who signed up. If you have not had a chance to sign up and you'd still like to do so, if you want to raise your hand now, we'll get you a card. Anyone?

(No response.)

THE HEARING OFFICER: If you change your mind, raise your hand, and someone will get you a card.

I'll call your name, and the procedure gives three minutes to each speaker. And we'll have a

timekeeper over here with some cards who will let you know when your time is running down and the clock is about to run out.

The hearing is scheduled to end at 8:00 p.m. Now, before 8:00 p.m. everyone who wishes to do so has had a chance to speak and you'd like another three minutes to expand on your earlier remarks, then we'll do that once we make sure that everyone else who wanted to speak one time has already spoken.

As I mentioned earlier, we'll give you a

9-14-10

microphone, this microphone right here so everybody can hear, and also it will help our stenographer here to make sure she gets your remarks accurately. Please clearly state your full name and the name of the organization, if there is an organization, that you're representing before you begin your comments. Please don't provide any other personal information like your home address and phone number, for obvious reasons.

As I said, your comments will be recorded by our stenographer verbatim. They'll become part of the transcript, and they'll be part of the permanent record of this meeting that will be published in the final EIS. The names of the individuals making the

33

comments, as well as their comments, will be in the final EIS, but personal home addresses and phone numbers and things like that will not be.

You don't have to speak for the full three minutes. If you choose to speak for the full three minutes you'll see a yellow card over here when you only have 30 seconds left, and when your 30 minutes have ended you will see a red card, and at that point I'd ask you to go ahead and wrap up your statement, and then you can just return to your seat. If you think you're going to run out of time, just go ahead and rack and stack your comments to make the most important ones first.

If, for whatever reason, you don't get a chance to voice all your comments or you think of something later that you'd like to comment on or if you don't want to voice your comments up here with the

Page 27

9-14-10

microphone, as we mentioned earlier, you can submit comments in writing, and there is no page limit to written comments. The air force gives equal weight to oral and written comments, and they all become a part of the official record and are included in the final EIS.

Before we start this, just a few concluding suggestions: Please limit your comments to the

34

draft EIS that is the purpose of this public comment period. Also, there's no need to repeat what another speaker has already said. If you agree with somebody on a particular point or issue, you can certainly say so, but since it's already recorded, you don't need to repeat it.

So I have the cards here. Did anybody else need one, one more time?

Okay, can we get a card here?

(Complied.)

THE HEARING OFFICER: Just go ahead and fill that out, and then he'll bring it up here and we can go ahead and get started.

Ms. Pfingston has asked that when you state your name, if you could spell it as well, that will help her out a lot to make sure that we get it correct in the record.

Let's see, first card on top here, from the USDA, is Mr. Merrill Nelson.

2001

Mr. Nelson?

MR. NELSON: Merrill Nelson, M-e-r-r-i-l-l, Nelson, N-e-l-s-o-n. Our program is USDA Wildlife

Page 28

2001 (cont'd)

9-14-10

Services. We help the ag communities here control predation for their livestock in this region. We fly about 500 hours in this area low level. We leave before the sun is up from the Spearfish Airport. And we have another airplane in Bison. And, like I say, we work these services.

Our program just started in May of 2009, so we couldn't work with the scoping process because we weren't here at that time. So, anyway, we fly 12 months out of the year. The last month in August we flew roughly a hundred hours alone out of the Spearfish area here. So our responsibility is to protect American agriculture, and that's what we try to do.

I've been a district supervisor for the program for about 20 years and as a trapper for 16 years before that, and I don't think I've ever seen any more low-level flight flying in this area, you know, below 500 feet, by ranchers and organizations, so there is a lot of low-level flight. And what my concern is is flying at 500 feet flying from Spearfish to our destination, maybe some mid-air collisions. Because we only put along at about a hundred miles an hour and, you know, your jet aircraft flies very fast, so the concern for my crews in the air is significant.

SA-1

So with that, that's about it.

THE HEARING OFFICER: All right, thanks, Mr. Nelson.

Let's see, I'll get one off the top here. The

9-14-10

next speaker I have is Mr. Chris Lien. I hope I got that last name right.

MR. LIEN: You did.

THE HEARING OFFICER: Okay, very good.

MR. LIEN: Thank you, Colonel Gregory.

Chris Lien, C-h-r-i-s, L-i-e-n. 2002

And, Colonel Gregory, I just wanted to say thank you for the opportunity for all of us to be here to comment. I stand before you this evening as a member of the Ellsworth Task Force, a local community group, a local business person, a general aviation pilot and a fifth generation property owner. And after having the opportunity to review the Environmental Impact Statement, I rise in support of the range expansion.] GE-1

And that is all I have. Thank you.

THE HEARING OFFICER: All right. Thanks, Mr. Lien.

Next is Mr. James Mirehouse.

Mr. Mirehouse?

MR. MIREHOUSE: James Mirehouse, M-i-r-e-h-o-u-s-e. 2003

I, too, stand in favor of the expansion. I have Montana livestock interests. I'm an aviator, and I am also a member of the task force here locally. But I really want to see the ability to make sure that our aircrews are combat ready. I also spent some time over in North Vietnam, so I think that it's very important that we have a capability to survive. Thank you.] GE-1] PN-1

37

Page 30

9-14-10

THE HEARING OFFICER: Thanks, Mr. Mirehouse, and thanks for your service.

Next I have Ms. Anita Lee.

Ms. Lee?

2004

MS. LEE: Before I start, could I trouble you guys for some of your water? Maybe you don't have any glasses. That's okay.

THE HEARING OFFICER: You can use my glass.

MS. LEE: That's okay. You guys took an hour and twenty minutes. If I'm going to refute that in three minutes, I thought I didn't want my throat to get too dry.

Anyway, my name is Anita Lee, A-n-i-t-a, L-e-e.

And as you folks have had two years to create and put together this environmental statement, we've had two years to study the impact from our side, and we have been studying how this has impacted the local folks, the ranchers, the farmers, the business

38

people in other areas that have been taken as training areas.

We do acknowledge that the Constitution does give the military the right to take our land for training. It also requires that we be compensated. And I have studied the different ways that the landowners have been compensated.

SO-1

Now, the first one, what I call the bottom of the scale, was New Mexico. The land was taken from those ranchers, and they were given nothing. They told them that after the war was over they'd give it back. Well, that didn't happen. They took the land from those people. They gave them nothing. To add

Page 31

9-14-10

2004 (cont'd)

insult to injury, they gave part of that land to Germany for a German base after giving them nothing.

There's one gentleman that was so incensed. His name is G.B. Oliver. Some of you maybe have met him. He's been to Rapid City at least once. He started an organization called the Paragon Foundation to help people across the country who are faced with this -- and there's a lot of us faced with this -- to help them fight for their land rights.

Okay, the next one on the scale was Nevada. This is where I started because two years ago we

39

were told this one would be exactly like Nevada, much, much bigger but just like Nevada. So I studied how those landowners were treated. There again, they took their land. They told them exactly like we've been told, "Oh, it'll have no impact. You'll never know we're there. It won't lower your property values." Yeah, right.

A young lady last week approached me. She wanted to know where this lied. She had bought a place in the country, nice, peaceful place to raise her kids, and one day the planes were flying 300 feet overhead and ruined their barbecue. And she didn't want that to happen again, and she wanted to know if this would ever happen again, and I showed her the map and yes, it would. She goes, "There goes my property values."

And that's what happens, you can't stand to live there; you can't sell it because nobody wants

Page 32

2004 (cont'd)

9-14-10

to buy a farm -- they say this won't impact farming. Yes, it will. We can't use our crop dusters. They've limited the hours to the hours that we can't spray. You spray the same hours, early in the morning, in the evening that they'll be training. Okay, if you have a ground rig, you can't use that without worrying about the wing vortice which will affect spray from a ground rig.

SO-2

40

Okay, you can't farm. What are you going to do? You can't sell it because nobody is going to want it. If the land values fall, you can't sell it. It's a domino effect. The land values keep falling and keep falling, and suddenly your land is worth nothing. You abandon it because you're tired of paying taxes. This is what happened in Nevada. This is exactly what happened in Nevada. And when things got really bad, maybe ten years later, they came in and gave the few remaining farmers and ranchers pennies on the dollar what it was worth.

Okay, a better alternative is what they did in Idaho. Now, in Idaho they went in, and what they've got is exactly what they're proposing here, but they had a lawyer named Fred Kelly Grant who represented them. He got those landowners exactly what their land was worth. And I suspected two years ago that's why they never mentioned Idaho; they didn't want us to look into that and find out that it was, number one, closer than Nevada and, number two, that we could be paid everything our land was worth.

Now, the fourth alternative is what I call the Texas plan. In Texas they pay the landowners by the

Page 33

2004 (cont'd)

9-14-10

year for the land that they use for the damages they cause. Now, I don't mean to underestimate Fred Kelly Grant's ability. He's a wonderful person, but that would be my chosen alternative, because those people can keep the land.

You know, once the government owns the land, there are no property taxpayers. It's devastating to the counties. If that land stays in private hands, then the counties can continue the way they are because they get their property tax. The cities will stay the way they are because those people living out there -- and this is a four-state area. This is your customer base, Folks. When we're gone, all those new stores they're building, where do you think they're going to go? So that would be my choice, but I'm sure it isn't up to us.

SO-3

But I see I've got the --

THE HEARING OFFICER: She's got the stop sign.

MS. LEE: -- the red sign. I didn't take an hour and 20 minutes like they did, but I thank you for your time.

Can I keep this?

THE HEARING OFFICER: It belongs to the Holiday Inn.

Let's see, next we have Mr. William Griffin.

Mr. Griffin?

MR. GRIFFIN: Thank you. You give her the card, and then she can take the names from the card instead of me spelling it. W-i-l-l-i-a-m,

Page 34

2005

G-r-i-f-f-i-n. Thanks very much.

Been a property owner in this area for 15 years, resident for seven years. Professionally I am trained as an environmental engineer and environmental lawyer. I spent much of my 33-year career in industry doing the same thing these folks did, which is examining projects, looking at the environmental impacts, deciding how to mitigate impacts, that sort of thing. And I am an enthusiastic supporter of the proposal that the air force has got here. GE-1

I'll mention one other story. The lady before me was a better storyteller than me, but I'll share one with you. We just spent three months in France, 60 million people in the space the size of Texas, so it's kind of crowded. There are no wide-open spaces there, but they do have an active military with jet aircraft. They frequently flew over the town where we were staying. Made some noise, but people are accustomed to it. The chickens did not stop laying eggs; the cows did not stop making cheese, and people were comfortable living with it and I was, too. BI-1

43

So thank you very much.

THE HEARING OFFICER: Good point with the cards, too. All right, thanks, Mr. Griffin.

Next I have Mr. Marvin Kammerer.

Mr. Kammerer?

2006

MR. MARVIN KAMMERER: Good evening. My name is M-a-r-v-i-n, K-a-m-m-e-r-e-r. In German it means caretaker. I assume we probably followed the lords

9-14-10 2006 (cont'd)

up with a scoop shovel to pick up after their horses.

Anyway, you're giving me three minutes to defend what has taken me a lifetime to try to put together, to defend what my grandfather came here for from Germany, to cross here with a wagon train supplying the mines in Rapid City in 1880.

36 people have died in plane crashes on our ranch. I know what the matter is. I have three cousins that had airplanes shot out from them in World War II. One of them had two of them shot out from under him. So I don't need to sit here and let people try to use the old red, white and blue on me.

Our land is sacred. What we are doing to it today is the same thing we did to the American Indian years ago and are still doing to him. We are

44

the next Indian.

If you want the overflight and the use of this land, then have the good grace to pay us like you do everybody else, in easements, property damage. Who would want to come to my ranch if a plane flew over, a whole fleet of them and I wanted to sell out or a neighbor wanted to sell out and he's been looking for this place for years, something like this? Here these planes just come zooming through. You wouldn't want to buy a house and live right next to a railroad track. That would be rather stupid if you wanted peace and quiet, and we treasure that.

SO-1

In 1980 the Corps of Engineers hauled my butt into court because I wouldn't sign an easement

Page 36

2006 (cont'd)

9-14-10

adjoining your base, 41 acres, not much, but it was the principle involved. So we took them to court, and we were a month and a half in federal court. I had a lawyer who it was his first case, but he was a man who would work for my interest.

We had a man by the name of John Fletcher. He worked for the navy, the army and the air force at times. He was an expert on wildlife and the noise effects on wildlife. That was one of our key witnesses, and we proved to them that the value of a place also includes the quiet and serenity of the

45

prairie.

Your planes -- we used to always keep several geese, ducks around. Every year the hens would come up with maybe a dozen eggs in a nest, hatch out probably ten, but once you brought in these big planes and with that decibel ringing that they get, we were lucky if we got two out of a hatch. Checking these clusters of eggs, you would find that the eggs had, in fact, been fertile, but the embryo died. I don't have any proof of that but I know. I live there.

So those of you who value the Sage Grouse, those of you who value wildlife better start paying attention, those who value the quiet serenity of the prairie, and that is a value added point to any ranch, deserve to be paid for it when you invade their space.

You can blow your money everywhere else. If it's so safe, as you say on the screen, then fly over Rapid City at 500 feet three times a week at

Page 37

SO-4

BI-2

BI-3

SO-1

PN-2

9-14-10

2006 (cont'd)

midnight, full bore. Give them the sound of freedom that we put up with. You are not saving any fuel because you people fly anyway, to Idaho or Nevada, it doesn't make any difference.

PN-2

And I'm kind of wondering, Colonel, you said

46

you had to get that plane back in time for another crew to get in it. Don't you have enough planes for the crews?

This whole thing raises as many questions as it answers. And we are the ones who pay your wage, and I am not convinced this is necessary for national security. I've heard that too damn much, and it's getting a little sour. My brother didn't go to Nam, my cousin didn't go to Nam and I didn't lose a nephew to Agent Orange to continue this any longer.

PN-3

Our boys are doing a good job over there, and girls, but they are not being used well. Just because we can doesn't mean we should.

God bless America.

THE HEARING OFFICER: Thank you, sir. All right, thank you, Mr. Kammerer.

Next I have Dr. David Schwietert. I hope I got that right, or close.

DR. SCHWIETERT: Close, close enough.

David Schwietert, S-c-h-w-i-e-t-e-r-t.

2007

Thank you, Colonel.

One of my concerns as a general aviation pilot is the routing between Rapid City and Billings. Of course right now we cut through the edge of the Powder River if we don't want to talk to anybody.

SA-2

AM-3

47

Page 38

9-14-10

2007 (cont'd)

And, of course, part of the problem is that when you're on low altitude in a G airplane, you can't get ahold of Denver Center because you don't have enough altitude. And then they want you to go up to where they can get you in radar contact and then put you right in the weather.

So my concern from an environmental standpoint is that I would like to see some coordination between the FAA and the air force and other facilities so that we would have an IFR corridor, I'll call it a GPS route, between Rapid City and Billings. It doesn't have to be open ended. It could be just a few thousand feet of altitude.

My biggest concern is a non-de-iced airplane is that if we do go to the west and we do fly that route, if we go Victor Airways, we're going to go over to Buffalo and then Sheridan up, and then you have to deal with the weather that comes off the Big Horns. And as most of us know who fly that particular route, you can get icing and other kinds of turbulent weather at any time of the year, especially in the wintertime. So having a more direct route over to Billings would be a safety-of-flight issue.

So, again, if we could have a route that would

AM-1

SA-3

be a GPS route say from 5- to 9,000 feet or whatever it is at low altitude so that we could get through in marginal conditions, we're going to have a lot better safety factor. Especially what we really desperately need is better communications at a lower

SO-7

9-14-10

altitude over in that area because that is a no-man's land. And if you try to get ahold of flight service at a low altitude or, you know, Flight Watch or Denver Center, you can't talk to anybody because they can't hear you. And I don't remember exactly how many you had said, 12 airports along that area, but, you know, it is, again, a safety-of-flight issue. I'd like to see that addressed in the EIS and in the proposal And I think that we can all live together a little bit better, but it hasn't been addressed yet.

So I thank you very much.

THE HEARING OFFICER: All right, thank you.

Next speaker I have is Mr. Robert Heidgerken.

My apologies if I mispronounced that.

MR. HEIDGERKEN: You did very well. It's Robert, R-o-b-e-r-t, H-e-i-d-g-e-r-k-e-n.

I'm a third-generation rancher. I live on a ranch just west of Ellsworth. I will be impacted by this by more noise as more flights are in the

49

holding pattern to land at Ellsworth.

I also have many neighbors and friends that live in the Powder River training area that will be impacted even more. And I am concerned about the flares and the noise. I grew up in the early '70s, and I have heard sonic booms, and it is not crack, crack. It is more like two loud rifle reports, one after the other, just boom, boom, and they are very unnerving. It's very hard not to duck when you hear these because you don't know where

Page 40

2007 (cont'd)

SA-4

2008

NO-1

NO-2

2008 (cont'd)

9-14-10

they're coming from or what they are. Sometimes you don't even hear the planes afterwards.

Also, by living near Ellsworth, some of the loudest noises I've ever heard is the sound of a loaded B-1 leaving Ellsworth with its afterburners on and you're looking right up at the pipes. It's not the average noise levels that the air force reports. It is much louder. And if you have to hear these all the time, it does become very unnerving.

I guess my final comment is: Who is the enemy here? What have we done to deserve treatment like this? Is this the new enemy?

I guess that's all I have to say.

THE HEARING OFFICER: Thanks. All right, thank you.

NO-2

NO-3

GE-3

50

Next is Mr. Allen Olson.

Allen Olson?

2009

MR. OLSON: Thank you. I have to bring my script sheet. Allen Olson, A-l-l-e-n, O-l-s-o-n. I'm a citizen of the sovereign state of South Dakota.

First of all I want to correct Anita a little bit. That land in Nevada was irrigated. Right now pipes are flowing with water coming out of it. The air force forced them out.

And I'd like to thank Mr. Griffin for bringing up that planes can fly over the cities, but I notice that our friends from the Ellsworth Task Force have never, and did not tonight, volunteer Rapid City to be overflown.

GE-4

Page 41

9-14-10

2009 (cont'd)

Now, what happened to me about a month, month and a half ago is never addressed in here, same with Mr. Kammerer, if we are not in this but if you've ever had a B-1 do a power 360 on top of you at 1,200 feet, you will know what noise is. And these little flyovers at the rodeo are kind of a joke. I think they would at least fly what they normally fly over me and throw their afterburners on. Because a B-1 does not emit decibels. That's a conversion. The air force is misleading everybody, and they always average it, which is another misleading.

NO-4

But to get on with what I was going to say: This comes from the Rapid City Journal. It's from Colonel Jeff.

I didn't want to destroy your name.

COLONEL TALIAFERRO: No problem.

MR. OLSON: But he says that the amount of traffic isn't going to increase. Well, I disagree with that. But what my original point is: I wish you would address the impact to the people out of the space on the way to the flight plan or to the airport to land.

AM-2

Now, I noticed that they conveniently left out the Warren Grove fire that was caused by a flare. Now, this is from an AID report from the U.S. Air Force. "There's clear and convincing evidence that the cause of the fire at Warren Grove Gunnery Range on May 15 was a wingman pilot error." Flyer -- or flyer impacted the range that ignited fire. 17,000 acres impacted. Something like 2,000 people,

SA-5

Page 42

2009 (cont'd)

9-14-10

burned their houses. That same airport had an F-16 off base strike an elementary school. I notice that was never brought up here.

SA-5

I noticed also that Linda DeVine failed to say

52

a boom of 5 pounds per square foot or greater would be heard. It's not very often, but if you're out on a horse and a boom hits you, it doesn't matter if it's once every 10,000 years or once every 20,000 years, you're on the ground and you're hurt. So all these averages I think are very disingenuous by the air force.

NO-4

I got other stuff in here, but you have a nice day.

THE HEARING OFFICER: And, again, on your other stuff, remember, written comments, no limit.

MR. OLSON: Do I still have a minute left?

THE HEARING OFFICER: Let me ask one question. There was one other fellow who had filled out a card. How many more cards do I have?

UNIDENTIFIED SPEAKER: Three more, sir.

THE HEARING OFFICER: Let me get these three, and then if we're still -- you've got one more little thing?

MR. OLSON: Right.

THE HEARING OFFICER: Go ahead.

MR. OLSON: On the life cycle of a flare, they've changed what they said. Originally they said the air force and the local fire department would react rapidly. Now in the next one -- because

SA-6

53

they know they can't react rapidly because they

Page 43

9-14-10

2009 (cont'd)

couldn't react to a $13-1/2 million fire that they created in '07 right on the base that spread out and destroys hundreds of acres of land. Of course, the Rapid City Journal, nobody covered it. It says now local agency will respond and just notify the air force. How sad.

SA-6

THE HEARING OFFICER: Thank you. All right, thank you.

I've got some more speakers here who signed up.

Mr. Ray Jilek?

2010

MR. JILEK: It's J-i-l-e-k.

I am the airport manager of the Black Hills Airport at Spearfish, South Dakota, which is underlying the entrance to this proposed expanded MOA. I'm also the owner of Eagle Aviation. We're the fix-base operator there, and we do a multitude of different aviation-related activities, from pilot training, aerial survey work, aerial spraying, charter. You name it.

One of the things that was mentioned earlier is the potential economic impact this proposal has. I don't know how relevant the word "potential" is. When you take an area that -- my backyard now, you draw essentially 180-degree arch and say, "This area

SO-5

54

is potentially off limits," granted, there is some provisions made for access through that area. As a pilot and an instructor, VFR would certainly be, as you would get the weather briefing, not recommended. If I'm out there in a hundred-mile-an-hour airplane and I'm looking for a five-hundred-and-some knot

SA-7

Page 44

2010 (cont'd)

9-14-10

airplane, chances of seeing are slim; avoiding are probably nil.

We do conduct a considerable amount of wildlife surveys throughout that area every year, and it's a little disheartening to think that we're going to increase the level of risk we already have. You take -- to put this in a context I can understand, we're looking at taking an area of airspace that's roughly the size of the State of Connecticut and increasing it to an area approximately the size of the state, square-mile wise, of the State of Indiana. And now you're telling me that my best flying hours, which are typically early mornings, are going to be off limits. And at times -- essentially the way I put it, to try and make sense of this in my own mind, is you're taking the State of Indiana and you're saying, Okay, you can drive on just the gravel roads to get around here.

Safety is going to be considerably less. Hope

55

you can avoid the milk truck coming around the corner and so on and so forth. And yet at certain times you can walk because you probably don't want to fly through there at all.

When we have these large-force exercises and so forth, I think economically it will be crippling to our business, as well as my customers who, coming from that area now, it was mentioned that the IFR traffic through the existing MOA, as well as the proposed MOA, is coordinated with the air force traffic, and that's not necessarily true. What we run into today is if there's one aircraft in that

Page 45

SA-7

SA-8

SO-6

9-14-10

2010 (cont'd)

MOA, as an IFR pilot we're not allowed access. We cannot go through that area. SO-6

There's no proposal for increased radio coverage or radar coverage, so in effect if we have one aircraft training in that MOA, the IFR traffic is eliminated. And, you know, to take an area of the size of the Black Hills Region as people want to be here, our airport is, according to your numbers in the EIS, is the fifth most active airport in the study area. AM-3

If you'll notice looking through those documents, there is no mention, there is no location, there isn't even a pinpoint to locate where Black Hills Airport is. We have activity that's going to be greatly impacted with the elimination of IFR traffic through and to our airport. AM-4

56

I guess that's all I have to say.

THE HEARING OFFICER: All right, thank you.

Next I have Mr. Matthew Kammerer.

2011

MR. MATTHEW KAMMERER: Matthew, M-a-t-t-h-e-w, Kammerer, K-a-m-m-e-r-e-r.

And I live as close to the base and ranch as anybody there could be. You don't get to be a cow man, you don't get to be a rancher in my mind unless you're there 365 days a year. You don't stand up here and tell me you own cows somewhere and you're a cow man. When you can pull a calf in, chill down, take care of baby lambs, put up hay, put it out in the wintertime, then you're a rancher or cow man.

Page 46

2011 (cont'd)

9-14-10

You're not a landowner operator just because you own land.

My family has owned land since 1882 where I still live. There is a desire to be there that you don't get by just buying land because you have money in your pocket, not by my standards anyways. And when you guys come to us and you tell us you want to be good neighbors, I've seen this time and time

57

again being at these meetings, when you walk out that door, you forget what the meaning of both them words are, and I ask you to go look them up in the dictionary.

When you guys come in and you start flying the way you do over my house and everybody else's house, bring your pocketbook because I'm sick and tired of being called a good neighbor and not getting the same thing back.

THE HEARING OFFICER: Thanks.

All right. Next I have Mr. Jeff Carsrud.

I hope I got that right.

2012

MR. CARSRUD: Jeff Carsrud, J-e-f-f, C-a-r-s-r-u-d.

I am a member of a four-generation ranch family that would be affected by this proposal, also a member of the Ellsworth Task Force, also Rapid City area economic development and an honorary commander and proud to serve at Ellsworth Air Force Base, and I stand in support of this proposal and for the defense of our country.

THE HEARING OFFICER: All right, thank you.

More cards? Bring them on down.

Page 47

GE-5

SO-1

GE-1

9-14-10

Mr. Larry Reinhold.
You're all set.

58

MR. REINHOLD: I appreciate it.
Larry Reinhold, R-e-i-n-h-o-l-d.

2013

You know, before I left tonight my son Danny came up to me and he said, "Boy, if they have any pictures of cool airplanes, bring them home." And I stand before you tonight also wishing to tell you that we have made many friends in the air force over the years, good friends. We're also one of those hundred-year families that have been on the Meade County prairie, and my grandparents homesteaded where we live right now.

We're currently working on a project on the ranch that could change it quite a lot. I'm not going to bore you with the details, but one of the things that we have kept in mind is we wish to preserve the integrity of that land, of that site, of that ranch and of that family. Stewardship is probably the best way to say it. I like stewardship. It's taking care of what God has given to us, what he's entrusted to us.

LU-1

We raise cattle and horses and a little wheat and that. We also run a camp, and for the last 31 years we've operated Rainbow Bible Ranch, straight north of the base 20 miles. And I'm proud to say that we've had a lot of kids come from Ellsworth.

59

It's been good, been a good relationship.
But I'm going to raise some concerns here

Page 48

2013 (cont'd)

9-14-10

tonight. Each day we saddle between 20 and 30 head of horses to take kids for a ride. Even after camp is over, every day my kids are on horseback. We're calving right now. In fact, we're branding Saturday. We raise horses; we train horses. My girls rode today. They moved geldings.

One night I took a bunch of kids out. It's not a trail ride. We really try to teach these kids how to ride. One August night I had 38 kids out with me. Agriculture is kind of known as a dangerous situation, but we've been led to bring in kids, too, and throw them on horseback.

You know, I do have concerns, yes, for the stewardship of the land; yes, I have concerns for the safety of my family, the integrity of the land, the ranch. I have concerns for the safety of the kids that come to camp. And with those 400 young people that come each year and their families, we desire to preserve an opportunity for these kids and their families to experience that big wide-open quietness.

In closing, all I have to say is some ad campaign says "Aim high". That would be my

60

suggestion. Consideration, compensation, keep that in mind. This is involving a lot of people.

We've had cattle on the Powder River area up near Ekalaka during the drought. I've seen the planes fly. I know how low they fly. Pretty impressive, pretty impressive air show when they fly through. It's kind of like having the Thunderbirds, but I'm not sure if I'm up to the Thunderbirds 365

Page 49

LV-1

SA-9

LV-2

SO-1

9-14-10

days a year.

Thank you very much. I appreciate it.

THE HEARING OFFICER: Thanks.

MR. REINHOLD: I appreciate it, sir.

THE HEARING OFFICER: Sure.

Any other cards? Any other speakers? Anything? I still have some time. Anybody want to expand?

Mr. Kammerer, I think you ran out of time. If you want to come back up, we'll put another three minutes back on the clock, as they say in the NFL.

MR. MARVIN KAMMERER: I won't bore you with just three minutes. Anyway, I have in my hand here two resolutions opposing the Powder River MOA, one from Dakota Rural Action, which is a very capable and honored organization in this state, respected highly in the legislature; another one from the South Dakota Stock Growers who last week came up with a resolution strongly opposing the deployment of this Powder River MOA. So these people represent a large area, and they deserve to be heard; they deserve to be considered. And if you're going to impact them, for God's sake, start paying your dues.

2006 (part II)

61

I mean, the Rapid City Task Force helped spend $17 million on a bridge that goes to nowhere east of the airbase. 5 million come out of the state so they could supposedly keep this base open. If the base hasn't any need for national security, let's get rid of it.

We can't keep pretending. Eisenhower warned us

Page 50

2006 (part II cont'd)

9-14-10

about this. General MacArthur warned us about this and take a look at what happened to the Romans.

My kids, when I'm pushing up daisies, are going to deserve a hell of a lot better than I see down the road to them. And they're all producing, every one of them. They're teachers; they're nurses. They raise kids on these ranches. Some of them are going to your service. Best damn kids in the world come off these ranches. Don't try to eliminate any more of them. They deserve and they're the best that there is in this state.

LU-3

THE HEARING OFFICER: Thank you. Sir, those

62

resolutions, they can be written comments.

MR. MARVIN KAMMERER: They will.

THE HEARING OFFICER: Okay.

I was just telling Mr. Kammerer, those resolutions, they can be considered written comments, so he's going to submit those, and anyone else can do so as well.

2004 (part II)

Is Ms. Lee still here? Ms. Lee?

I was going to give her more time.

I thought you wanted a little more. If you do, we'll put three minutes back on for you, too.

MS. LEE: Well, I don't know that I need three minutes, but I will thank you for not doing what you did two years ago.

The commander has pretty much told us that the need for this was saving fuel; they had to go all the way to Nevada, and they were causing these people to burn too much fuel. Well, I'm glad you got off of that because as we got to the end of the

Page 51

2004 (part II cont'd)

9-14-10

Environmental Impact Statement it said the biggest impact, it wasn't for ranchers that were going to be displaced; it wasn't the air pollution that was going to be increased many times over. It was the major increase in fuel consumption, kind of the opposite of what we were told, but it's a major

63

increase in fuel consumption because the planes that fly over us will have to go around. And I don't just mean the little guys. And I don't mean to belittle you. You did a good job, and that was a good point. There's a lot of little airports that will really be in trouble.

But the Environmental Impact Statement went quite a little into the major airports that would be impacted. We only have about 500 of the big airplanes that go over us a day. I'm talking about Northwest, United, the big airplanes, the high level. But in a bad weather situation, which they said on the average occurs about a hundred days a year, we are their bad weather route. If there's a storm south of us, which they said on the average is a hundred days a year, they fly over us, so this is when we impact the big boys. They listed Seattle, Washington D.C., New York. I can't remember them all but pretty much all the big airports. They said when they couldn't go around -- or go over here to go around their usual route, it would, on average, impact by giving a two-hour delay.

Well, you know how this domino thing is, if you mess up these big airports by two hours, you're

Page 52

SO-7

SO-8

SO-7

2004 (part II cont'd)

9-14-10
going to impact the international flights. And if
64

anybody has been paying attention to the news, they know that our big air carriers are hurting financially. It isn't the air force that needs money to buy fuel; it's our domestic carriers. So they're going to save a little fuel maybe by making our major airlines spend a lot more on fuel. Now, I don't see how that's going to help the economy anywhere. But I do appreciate the fact that at least they didn't tell us that was their need.

SO-7

So we've all learned a lot in the last two years, and I'm sure we'll learn a lot more. And I thank you for the time.

THE HEARING OFFICER: Thanks.

Anyone else wish to add to their remarks?

Would you state your name one more time for her, just your last name.

MR. OLSON: Olson.

2009 (part II)

THE HEARING OFFICER: There we go.

MR. OLSON: And I'd like to invite you folks -- you'll have to probably drive to Belle Fourche or Alzada -- to stop at the ghost town of Whitewood and see, I suppose, a thousand people. And I hope this isn't indicative of your whole Environmental Impact Statement. It's right past Sturgis. A thousand five hundred, doesn't matter, but it's not a ghost
65

CU-1

town by any means. But -- and that's on Page 3, 120 are ghost towns.

But I'd like to read Douglas MacArthur. In 1957 he said, "We have to remember that the
Page 53

GE-6

9-14-10

2009 (part II cont'd)

Department of Defense consumes more money than all 50 states." And this is why -- and this was said in '57 and is still indicative now. I heard it the other night. It's the sound of freedom. He goes, "Our government has kept us in a perpetual state of fear, kept us in a continuous stampede of patriotic fever with a cry of grave national emergencies. Always there has been some terrible evil at home or some monstrous foreign power that is going to gobble you up" and we did not blindly "if we did not blindly rally behind it." Now, that was over 50 years ago, and it's still indicative today.

GE-6

Thank you.

THE HEARING OFFICER: Thanks.

Anyone else wish to add to their remarks?

Well, again, I want to thank you for coming out tonight. If you've not had an opportunity to do so, please take a look at the display boards that are still out there. And if you want to do the written comments, please provide those as well.

I appreciate your time and your interest in the

66

Powder River Training Complex EIS proposal, and tonight is certainly not the end of your opportunity to participate in this process. Written comment sheets are available at the registration table. You can turn these in tonight; you can mail them; you can fax them at your convenience. If you do mail your comments, send them to the address that's printed on the brochure and the comment sheets.

Public comments are welcome in writing at any

Page 54

time during the Environmental Impact Analysis Process. However, to receive timely consideration for the final EIS, all comments must be submitted by November the 15th, 2010.

If you'd like your own copy of the final EIS, please let us know at the registration table or send a letter or a postcard, and then we'll send copies of the final EIS to you.

I want to thank you for your participation. I'm going to go ahead and adjourn the formal part of the hearing.

And, again, the posters are still up outside, and I believe our representatives will be out there and available if you'd like to chat.

So thank you again for coming out tonight.

(The hearing concluded at 7:45 p.m., September 14, 2010.)

STATE OF SOUTH DAKOTA)

COUNTY OF PENNINGTON)

I, CINDY K. PFINGSTON, hereby certify that the foregoing pages numbered from 1 to 66, inclusive, constitute a full, true and accurate record of the proceedings had in the above matter, all done to the best of my skill and ability.

DATED this 30th day of September, 2010.

_____

CINDY K. PFINGSTON
Registered Professional Reporter

9-14-10

My commission expires:
February 4, 2016

9-15-10

the record.

So with that, the card on the top, let's see, Mr. Guy Edwards?

Come on up, Mr. Edwards.

2014

MR. EDWARDS: Can I speak from here?

THE HEARING OFFICER: You can.

Can everybody hear him if he speaks from there?

MR. EDWARDS: I have a concern because I'm a

pilot of a small plane, and it resides in Spearfish, a small airport. And I'm concerned about the size of this new military operation area being so close to the airport, which is a busy, active, small GA airport, surprisingly a busy little airport, and the impact it's going to have on that airport in the future because it's going to change the pattern of people's flight.

AM-5

I know when I'm making a decision on going somewhere and I see a military operation area, you know, it will change my vectoring to a location because I'll vector to a corner of an MOA, for example, if I go to Sioux City or something and I've got an MOA in the area south of Mitchell. So you'll make those decisions.

And with this size of an MOA -- obviously you've heard this before, but this is a giant MOA. So if somebody is making a decision to come from Seattle or Portland or someplace to come across the country or Minneapolis going the other way or North Dakota coming down, that giant footprint is going to change their decision-making when they decide to buy

SO-9

2014 (cont'd)

fuel or spend the night or buy a cabin in the Black Hills or come here and visit versus somewhere else if they happen to be pilot oriented using flight or

SO-9

chartering flights or whatever.

So I see this as -- you know, I'm a big fan of the air force. I've been on some trips with the air force as a guest of the air force. I've been impressed for 40 years with that association, but this footprint is gigantic when its size is spaced the way it is. I mean, you're talking 300 miles across, I suspect, or 250 to 300 miles across. So when you're going north/south, that says no plane up to 60,000 feet can go through that area and, of course, no little planes. And even general aviation or commercial aviation flies much over 36,000 to 41,000 feet, so it's going to affect not only my little Mooney but nearly every plane in America making decisions, whether you're a corporate, decision-maker for corporate flights or even if you're Northwest or Delta Airlines making decisions, this is going to impact them.

AM-6

But I'm, of course, being selfish, and I'm mostly concerned about the Spearfish Airport and the Belle Fourche Airport. So if you can change this up into North Dakota, I'd be very happy. Canada would be better.

SO-10

THE HEARING OFFICER: Okay. Thank you, Mr. Edwards.

Next, Ms. Lee.

MS. LEE: I'm afraid I might need the mike. I

9-15-10

don't have as good a voice as Guy.

THE HEARING OFFICER: Let me give you this one so we don't risk getting her equipment off that table.

MS. LEE: I'm Anita Lee. You've got my name from last night. I was at the meeting last night, and I did go through -- and I won't repeat what I said last night, but I did go through the four basic ways that landowners are reimbursed for these training areas. And the base commander, after the meeting, was gracious enough to come and visit with me, and he explained that they have no intention of reimbursing us because they feel that they are not taking anything from us, and that tells me which direction we need to go.

2015

SO-1

Well, I came tonight with better ammunition. And I won't read to you all of this, but I will share anything I have in my hand to anyone interested after the meeting. But I brought just a legal dictionary, and under eminent domain it explains -- we all know what eminent domain is, so I won't go into that, but "Another property right that is litigated and routinely protected is the right to

37

reasonable and ordinary use of our airspace over our homes." That means that it's often litigated, and the landowner always wins. That's encouraging.

It also says that taking of the property, by reducing its value is a taking, and under those examples of things that take the value is noise.

And then they gave us a new term, inverse

GE-7

SO-1

GE-7

Page 30

2015 (cont'd)

condemnation. Some of you maybe haven't heard of that. Some of you maybe have. And that is enacted when the taker makes no attempt at eminent domain. Then the landowner, business owner -- Mr. Edwards gave us a good example of a business that will be impacted.

GE-7

Another excellent one, I think, would be campgrounds. These planes go over your campground, and the next thing early in the morning these people want their money back for the rest of the week because they're not going to go through that again another night. There's a lot of businesses that are going to be impacted by this.

SO-9

Okay, the courts have held -- and I brought with me in this little pile of stuff 25 to 30 examples of court cases that have been proven by inverse condemnation proceedings. That means the property owner has to go to court to sue the taker

what they have won. And we are entitled to compensation, and don't let them tell you we're not because we are.

SO-1

And I see I have the flag. And I won't run over tonight, but I would reserve the right to come back if there is time for a second speech. And I will share my information with anyone who is interested in it.

Thank you.

THE HEARING OFFICER: There will probably be time.

Next I have Mr. William Hauck. I hope I got that right.

9-15-10

Mr. Hauck?

MR. HAUCK: First I'd like to say --

THE HEARING OFFICER: Mr. Hauck, would you mind spelling your name for our --

MR. HAUCK: H-a-u-c-k, William. 2016

THE HEARING OFFICER: Thanks. Would you like to use the mike, or you want to --

MR. HAUCK: No, I'm fine.

THE HEARING OFFICER: You're good? Okay.

MR. HAUCK: Thanks to the military for keeping us safe with their practices. They need to do that.

I'm a North Dakota native. I made a flight to

Miles City the other day in my Subsonic Piper 140. Do you think it's possible that the environment could impact the air force? I counted nine high-flying raptors, eagles and hawks on my way up to Miles City. Do you remember Sully and the Hudson? Flying that low at 500 feet off the deck at that speed, there's always that possibility, and I'd like to encourage you to take that into consideration. SA-10

Thank you.

THE HEARING OFFICER: Thank you, Mr. Hauck.

Mr. Clark Blake? Mr. Blake?

MR. BLAKE: I'm a rancher that's under the current MOA, and we've had a lot of, I guess, harassing things on our ranch with low-flying aircraft, and I expect that it's going to get nothing but worse with this. I've been there long enough that I experienced the supersonic booms from 2017 NO-5

2017 (cont'd)

9-15-10

back in the '70s when they were doing that very routinely and also the low-flying fighter jets which are going to be part of this also.

I raise cattle and sheep, and it's imperative that I'm able to fly to check that. I'm a pilot and fly a small plane, and this is going to have a significant impact on my operation. It's already

NO-5

SO-11

40

something that I have to be very aware of when I'm flying looking out for the bombers, but when we get those, especially fighter jets in here, I realize you're saying that they're not going to come below 500 feet. You may not, but I -- in the past my experiences have been that you do routinely as low as a hundred feet. Prior to when they erected that B-1 in the '90s, they rarely got that high over my place.

So I'm opposed to this. I appreciate the work the air force does in defending our country, but I don't know that we should have to bear the impact of this to keep our country safe.

GE-2

THE HEARING OFFICER: Thank you.

Any other speaker cards out there?

Mr. Jim Johnson?

2018

MR. JOHNSON: I want to ask a question in regard to your supersonic elevations and how many decibels. You said that they exceed a hundred decibels. Now, is elevation a big factor in the amount of decibels that actually hit the ground?

NO-6

MS. DeVINE: Yes, sir, a sonic boom will hit the ground by pounds per square inch, and the altitude and the actual aircraft itself, the size of

Page 33

9-15-10 2018 (cont'd)

the aircraft will affect the pressure on the ground

41

or the vibration of the ground, so will the atmospheric conditions.

MR. JOHNSON: Is there any ultrasonic magnetic waves involved in the sonic boom?] NO-7

MS. DeVINE: Magnetic wave, no.

MR. JOHNSON: You're sure about that?

MS. DeVINE: It's air pressure.

MR. JOHNSON: Now, you've got your fighters at 10,000 foot above sea level.

MS. DeVINE: Above ground level, sir.

MR. JOHNSON: Ground level?

MS. DeVINE: Yes, sir.

MR. JOHNSON: But you don't know what the decibels would be at 10,000 foot on the ground for a direct flight with a small aircraft, your fighters? How many decibels would it be?] NO-8

MS. DeVINE: Off the top of my head, sir -- noise varies based on the configuration of the aircraft at the time, and the altitude --

MR. JOHNSON: Well, you're talking about the fighters, and then you're talking about the B-1s.

MS. DeVINE: Yes.

MR. JOHNSON: So you probably know what they would be. I suggest you find out before you go any further.

42

MS. DeVINE: There is a table in the draft EIS, sir, that if you'll see me afterwards we can look for that.

Page 34

9-15-10

2018 (cont'd)

THE HEARING OFFICER: All right. Thanks, Mr. Johnson.

That was J-o-h-n-s-o-n.

Next I have Mr. Paul Soulek. I hope I said that right.

MR. SOULEK: Soulek.

THE HEARING OFFICER: Soulek? Sorry.

MR. SOULEK: S-o-u-l-e-k.

2019

I was called this morning to come here and speak for the South Dakota Aviation Association. For you that don't know what that is, it's an organization for aerial advocators.

And I guess the concern is the low-level part. Now with the amount of towers that are popping up all over where -- we have a saying called "At five, stay alive." So we are flying higher to get to the fields. And I see that the area that you guys are moving out into are into more crop ground.

In the summertime we have a large amount of aerial application going on, so the concern is the low-level high speed getting tangled up with the airplanes.

SA-7

43

So that's, I guess, what I wanted to point out.

THE HEARING OFFICER: Thanks for bringing that up.

UNIDENTIFIED SPEAKER: Where are you from?

MR. SOULEK: Spearfish.

THE HEARING OFFICER: Next I have Mr. Ray Jilek.

MR. JILEK: Jilek.

THE HEARING OFFICER: I'm sorry?

Page 35

9-15-10

2020

MR. JILEK: Jilek, J-i-l-e-k. I'm the airport manager at the Black Hills Airport in Spearfish, and I spoke last night briefly, and I won't go over that.

One of the things in trying to digest this Sears and Roebuck Catalog as I see as your environmental assessment, I haven't run across any notes so far, but I'm curious, I've stumbled across a document here earlier when the scoping meetings came out was an exception 7960-C. That appears to allow and give the air force exemption to fly lights off at night in this MOA existing today.

AM-7

And my concern is we've all been led the direction to believe that the IFR not being an alternate to get through this airspace, well, we can just go VFR and see and avoid. And now logically as

44

the traffic numbers increase, that expediential (sic) increases the danger to me as a pilot and anyone else that's in that airspace assuming they can see and avoid.

SA-11

Now you guys shut your lights off out there, we've got a whole other story. If I'm flying through there at night, do you want me to take your families for a ride? Another analogy might be when we leave here tonight, maybe you can keep your headlights off and drive back to Ellsworth Air Force Base and the rest of the drivers will see and avoid you.

So we're limiting our options. And this is one thing that has been granted to the air force. I

Page 36

9-15-10

2020 (cont'd)

don't know and I haven't run across the plans if that's part of this to be used, but it significantly changes the game plan if, in fact, we're limited and we can't fly through this airspace. And now it would be absolutely foolish for me to fly out there VFR when you guys don't have your lights on.

So my concern is to the communities that are involved and us as citizens, this is a significant economic factor that is only identified in this document as a potential economic impact to us as citizens, communities and people who live here.

SO-6

45

When you take this airspace and essentially close the door, everything north of my airport, and say no VFR -- or no IFR traffic is allowed through that area and VFR traffic might be playing Russian roulette to get through there, that's no different than shutting off Highway 85 North to this community and saying, We're going to allow you to use it from noon to 6:00 p.m. only. The economic impact to all of us I don't feel has been established, quantified or addressed in this document.

SA-7

SO-6

Thank you.

THE HEARING OFFICER: At the beginning of your comment I thought I heard kind of a clarification question.

I don't know if any of our representatives, perhaps FAA, this exemption that he mentioned --

MR. JILEK: I've got a copy of the exemption with me.

THE HEARING OFFICER: See Mr. McGrath.

Oh, there we go. I think he asked if that was

Page 37

9-15-10

2020 (cont'd)

going to apply.

MR. MCGRATH: That may be in effect (inaudible) --

MR. JILEK: It is in effect currently through January of 2013. There's a copy of it (inaudible).

46

MR. STONE: George Stone.

We have a memorandum agreement that controls (inaudible). It's currently not being used; however it is still in effect with both Salt Lake Center and Denver Center. I don't have the details on that.

MR. JILEK: This appears to be valid through January 31st of 2012, after which it can be extended or renegotiated, I'm sure.

THE HEARING OFFICER: All right. Well, thanks for bringing that up, and I think we can get some more clarification on that.

Mr. Gene Johnson?

2021

MR. JOHNSON: Yeah. J-o-h-n-s-o-n.

THE HEARING OFFICER: All right, thanks.

MR. JOHNSON: I'm a rancher north of here. I hope you don't come my way. I appreciate the military. I'm a patriotic American, but this is going to cause a lot of damage to our livestock.

SO-11

And as Blake was saying, I've got a small plane I use and fly on a daily basis, low level. And I've experienced some B-52s going through.

As you're flying around, you're looking at the ground, you're looking at livestock, or if you're aerial hunting, you're constantly looking at the ground, especially them B-1s, you'll never see them.

47

Page 38

9-15-10

2021(cont'd)

They'll be by you before you ever see them. The wind verticals, you've already gone by. I've hit them, and they about flip you over. I'm not sure they haven't downed a few planes and been through a wreck and didn't know it, what might have went down.

SA-7

I question the effect it'll have on wildlife, where the sage grouse is primarily on what I think of -- they're possibly going to be put on the endangered species list, and they're a very touchy little bird. And I question whether that's been addressed on the effect it'll have on some of these birds and wildlife. I know what they'll do to livestock. They'll tend to bunch the sheep up.

BI-3

Land values, it'll affect your land value. I mean, nobody is going to want to buy a ranch if you're on a direct flight to these B-1s. I mean, they are loud, really, really loud. They'll shake your house. You don't have to break the sound barrier to shake your house. I know you guys gotta fly somewhere, but we're going to pay a price, and it's going to cost us, especially I would say in values of our real estate. And if I was buying a ranch and there was a, under a flight zone going over the top of my house, I wouldn't think about buying that. And hopefully I won't have to sell

SO-1

NO-5

SO-1

48

mine. But it'll lower the values of the real estate without a doubt. I think there should be some compensation if this is forced on us like this.

Because don't mislead yourself, it is going to affect us. And we're country people. We like

Page 39

9-15-10

2021(cont'd)

our -- one reason we live out in the country is because we like peace and quiet, and you're talking major noise, and it affects livestock, it really does.

Thank you.

THE HEARING OFFICER: Thank you, sir.

UNIDENTIFIED SPEAKER: What's your address?

MR. JOHNSON: Belle Fourche.

THE HEARING OFFICER: Any other cards? Well, we still have some time and -- yes.

2022

MR. EDWARDS: Guy Edwards.

You don't fly with transponders on, do you?

MAJOR WINTERS: Yes, sir.

MR. EDWARDS: Oh, you do? So if I have a little instrument in my plane, it'll pick you guys up?

MAJOR WINTERS: We don't have TCAS. We have a transponder that communicates with --

MR. EDWARDS: Are you transmitting a code that is normally picked up as anybody else would be

AM-8

picked up if you were submitted?

MAJOR WINTERS: No, sir. We don't transmit and receive with other aircraft, if that's what you're asking. Like with a TCAS type system, we do not have that.

MR. EDWARDS: So you're relying solely on radar as you're moving along seeing a plane in front of you? Obviously you would be able to see other targets like a small Cessna or a Mooney or something like that that's flying in this MOA VFR and you're

2022 (cont'd)

9-15-10

flying in a B-1 or a fighter plane, you can see those on your scope, can't you?

MAJOR WINTERS: When we're daytime VFR flying low altitude we're see and avoid. Pilots are using a visual scan to see and avoid other aircraft.

MR. EDWARDS: At what, 3-, 400 miles an hour?

MAJOR WINTERS: At 540 knot speed.

MR. EDWARDS: Six hundred plus miles an hour?

MAJOR WINTERS: I couldn't tell you what the conversion is right now. We use knots.

MR. EDWARDS: Let's say 600 miles an hour then. So you're low, flying VFR in a sense, and you're doing see and avoid at 600 miles an hour. I'm glad I'm just flying a little slow plane because I don't know how in the world a person could do that. I'm sure you've got to be younger and highly skilled and highly trained because that would be off the charts as far as a skill. So you've got to really say kudos to those pilots that can do that.

50

What scares me is that I'm flying along, not that I intend to live forever, but I'd hate to be taken out by another plane and see that they have no ability to see me other than if they happen to see me. Now, they're also flying at such a speed that they have to really concentrate, so they may not even pick you up.

SA-7

I know when I'm -- I can get -- air traffic control says, You've got traffic two miles away at one o'clock. Now, let's say five miles. Not unusual for air traffic control, you're going through -- you're on radar. You're on either IFR or

Page 41

9-15-10

2022 (cont'd)

flight following, so you're on radar with air traffic control in communication with them, and they tell you five miles, one o'clock, traffic. And you can't imagine how often you look out there -- and you know where it's at, five miles. You know it's 2,000 foot above you, and you look and you look and you look, and you can't even see the plane. And you would think, Boy, dummy, why can't you find that plane? And you start scanning, you know, from noon to two, a thousand foot above you trying to find that plane, and it's hard to find that plane.

51

Now all of a sudden you've got a guy in a 600-mile-an-hour airplane 500 foot off the ground doing that, it would be a near impossibility -- even if you did see it, I don't know how in that speed you could avoid, almost certainly avoid that quickly because he's looking at instruments and looking at the ground and having to concentrate very hard at just managing the flight of the airplane.

SA-7

So those are obviously concerns that anybody in a Super Club -- a Super Cub or a small plane would have to be really worried about.

THE HEARING OFFICER: All right. Thanks for raising that.

I think we have someone else filling out a card here.

And, ma'am, you're obviously going to be next. Is it Maass?

MS. MAASS: Maass, that' correct.

THE HEARING OFFICER: M-a-a-s-s, Susan Maass.

Page 42

2023

MS. MAASS: I'm located out near Union Center, and I'd like to speak on behalf of Buffalo ranchers in this three-state area.

What I'm learning by being here tonight is the amount of noise. The low flying is definitely going to affect buffalo herds, and South Dakota is the largest population of buffalo in the United States. I believe North Dakota is second in amount. And once they spook it's a little bit different situation than when other animals spook. And I don't have the exact numbers on that, but I could look it up.

NO-5

BI-4

THE HEARING OFFICER: Thank you, ma'am.

Anyone else who has not had a chance to speak yet who would like to?

Let's see, Ms. Lee, you wanted -- as they say in football, "Put three minutes back on the clock."

MS. LEE: Can everyone hear me?

Last week the South Dakota Stock Growers had their annual convention in Rapid City. They passed unanimously a resolution opposing this. And one of their demands, which I thought was excellent, they want any claims to be handled locally. The Environmental Impact Statement says repeatedly that if you have a damage claim, you're to dial this number, which is the Public Relations Office at Ellsworth. And just for kicks I had to dial the number. It's been three weeks, and so far they haven't returned my call. If they have that big of a backlog already, I hate to think what it's going

SO-12

GE-8

9-15-10

2023 (cont'd)

to be when this thing gets fired up. But I think the main reason this is an excellent idea is it takes a lot of expertise to handle these claims.

GE-8

Okay, so your horse spooks, your horse goes through the fence, what's a horse? Is it an old plug that nobody rides and was about to put down anyway and so all they owe you is the vet bill, or is it your daughter's championship barrel horse that she won the national championship on and in which case the vet bill is not anywhere close to compensation.

SO-13

Or say your husband was spraying and one of these wind vortices moved the chemical off to the wrong field and suddenly he put RoundUp on his field, okay, what's the value of a field? Is it Alfalfa that is a beautiful sand and you were saving for seed, or is it a wheat field that's already been hailed and -- you know, it takes a lot of expertise. You're going to have to have several people on this committee.

SO-2

How about your real estate? Okay, you go to sell it and nobody will buy it; it went down to zero. You should have at least one real estate agent on this board.

SO-1

54

There's a lot of reasons why handling these claims locally makes sense. I could not find precedence for it anywhere, but if we're going to be the biggest training area in the country, maybe we should set the precedence. It's got to start somewhere, and I think it's an excellent idea. And

Page 44

2023 (cont'd)

9-15-10

I do have their entire resolution with me if anybody wants to read it, but I won't bore you with it now.

Thank you.

THE HEARING OFFICER: Thank you.

Sir?

MR. HOWARD: May I ask a question?

THE HEARING OFFICER: Again, you can make a comment, and if it's something we can clarify, we'll certainly do that.

2024

MR. HOWARD: Two questions. One is: Is there another MOA in the area or region or the country that matches the distance that we're talking about? PN-2

Second question: Is there a contingency, if we vote this down, the air force agrees with us? Two questions. NP-1

THE HEARING OFFICER: Well, I don't know about the other MOA.

If any of you folks could clarify that.

I don't.

55

MAJOR WINTERS: Sir, that's discussed in the draft Environmental Impact Statement. There are other military operating areas in the country. However, we're proposing to expand the current airspace that we use locally to affect realistic combat training for us, and that will enable us to do more training, if that answers your question.

And your second question, I'd be happy to speak to you afterwards after everyone has had time to speak and talk to you about that as well.

THE HEARING OFFICER: Did anyone else want to reengage?

Page 45

9-15-10

2020 (part II)

MR. JILEK: Jilek, J-i-l-e-k.

Just kind of working my way through this whole concept and the gears turning and so forth, I'm wondering if, in fact, it's realistic to assume that this is really the intent of the Military Operations Area, or have we moved beyond that to a restricted airspace concept? AM-9

When we start talking about aircraft that are traditionally limited by the FAA to 250 knots below 10,000 feet altitude and now we're mixing up with aircraft at 500, plus whatever knots, at low altitudes, we're talking about potentially the question I raised earlier was the nights lights-out SA-11

56

operations at night. We're talking about chaff; we're talking about flares; we're talking supersonic flight; we're talking about a lack of radar coverage SA-27 where you can't see me out there, center can't see me, nor can I talk to anyone. Is this realistically AM-3 an environment that should be considered an MOA, or should it not be training that is conducted in a restricted area where the airspace is already locked down; it's your playground; you go out there and play with all your big toys, train up as best as you can. AM-11

And I think everyone in here would agree we need a well-trained military, and we all support you in that direction. But economically I don't think that it's proper that we, as the locals, pick up the tab. SO-14

THE HEARING OFFICER: So the concern would be

Page 46

2020 (part II cont'd)

9-15-10

restricted airspace versus a MOA?

MR. JILEK: These training activities I've come to believe are more appropriate in a restricted area, yes.

AM-11

THE HEARING OFFICER: Thank you.

Anyone else?

MR. JOHNSON: Johnson.

THE HEARING OFFICER: Thanks.

57

2018 (part II)

MR. JOHNSON: When we're flying these airplanes, you know, can fly around 200 foot probably or lower, but my life is in your hands. I'm not -- you're going to go by me, and I don't think you see me.

SA-1

I mean, I've had them fly over my place there a few years back, one right after another, B-52s, and I just thought I'd see if they would see me, so I headed right for them, same level. They don't move. I moved out of the way because you weren't going to move. There are a lot of people out there flying airplanes, and you're a lot bigger than we are. You can knock us out of the sky.

I've got kids. I got a family, and I don't want to die in an airplane with a head-on collision or knocked out of the sky. Because it's a fact, those wind verticals are dangerous.

SA-7

THE HEARING OFFICER: Thanks for sharing that.

Anyone else who would like to make a comment who has already spoken? We've still got some time if you want another three.

(No response.)

THE HEARING OFFICER: All right.

Page 47

Well, again, I appreciate your time and interest in this EIS proposal. And as I said at the beginning, tonight is certainly not the end of the opportunity to participate in this. Those written comment sheets, again, they're available on the registration table. You can turn these in tonight. You can mail them, or you can fax them. If you mail the comments, please send them to the address that's printed on the brochure and on the comment sheets.

Public comments are welcome at any time during the process, but to receive timely consideration, again, as I said earlier, all comments must be submitted by November the 15th, 2010.

If you'd like your own copy of the final EIS, please let us know at the registration table or send a letter or a postcard asking for your own copy and we'll send copies of the final EIS to you.

Thanks for your participation. The formal part of the hearing is adjourned, but this place will remain up, and the representatives will be available if you'd like to chat some more about the displays and the projects.

Thank you very much.

9-15-10

COUNTY OF PENNINGTON)

I, CINDY K. PFINGSTON, hereby certify that the foregoing pages numbered from 1 to 58, inclusive, constitute a full, true and accurate record of the proceedings had in the above matter, all done to the best of my skill and ability.

DATED this 30th day of September, 2010.

_____

CINDY K. PFINGSTON
Registered Professional Reporter

My commission expires:
February 4, 2016

MR. NELSON: I get to be first, huh?

HEARING OFFICER GREGORY: If you'd like to. Otherwise I can call Ms. Linda Gilbert.

MR. NELSON: Call Linda.

HEARING OFFICER GREGORY: The floor has been yielded to Ms. Linda Gilbert. Ma'am, you can come down here.

MS. GILBERT: Here I thought --

HEARING OFFICER GREGORY: Beauty before --

MS. GILBERT: Yeah, yeah.

HEARING OFFICER GREGORY: Tell her your name.

MS. GILBERT: Linda Gilbert, resident of Harding County. And my comment is, we have a natural gas field on our ranch, and I'm concerned about the effect of the flares because there's no shut-offs on individual wells. If a flare were to hit, it would cause the whole gas field to be compromised. So I wanted to make that sure.

And also, we have private pilots on our place, and I'm concerned about the radar, whether it's possible with the radar between Dupree and Miles City -- right, Larry? Between Dupree and Miles City is where the radar is ineffective. So we don't know necessarily if the fighters will be aware of civilian aircraft in the air.

2025

SA-12

AM-3

2025 (cont'd)

So that was a comment I wanted to bring up. Thanks.

HEARING OFFICER GREGORY: Thanks, Ms. Gilbert.

MS. GILBERT: Thank you.

HEARING OFFICER GREGORY: Thank are you for those comments. They will certainly be considered.

MS. GILBERT: Okay.

HEARING OFFICER GREGORY: All right.

MR. NELSON: So I get to be next.

HEARING OFFICER GREGORY: You're next.

MR. NELSON: I don't think I need a comment -- or a microphone either. All I have is the subjective summary and I was looking that over this afternoon. I didn't have a whole lot of time to look at it. But some specific comments that I would like to make is, in your Summary of Environmental Consequences in Powder River 2, you make the statement that two public and one private airfields are all located.

I have a list here in Harding County alone of 18 people that own airplanes. Now, most of us, and that includes myself and there are a couple other people that are sitting here, most of us have never registered our airports -- our airstrips because we're not required to. We have to assume that if

AM-4

these airplanes appear, that they're operating here in this airspace.

2025 (cont'd)

And so when airplanes are registered with the FAA, you have to give locations where they're at even though there is no airport registered. And this started in the 1980s. And I've had to do it and I'm sure everybody else who's had an airplane has had to do it. You folks can find those airplanes if you go to the FAA registry. There are more airplanes than -- on private strips than one just in Harding County alone.

I run -- I live -- maybe I need to back up. My name is Larry Nelson and I ranch here in the Harding County, and I'm in the sheep business and I use my airplane not for recreational flying but a lot to do predator control. If I cannot do predator control because of this 500-foot floor on this thing, I will have to sell my sheep. That is the consequence to me.

SO-15

And written comments I will send later. I will give you the amount of coyotes that we've killed over the last two or three years. We've kept coyote loss at a minimum. But back in the '80s before I had an airplane, I had losses that were approaching 10 percent. And you can't take 10 percent of income

SO-15

2025 (cont'd)

out of any of us in this environment and stay in business. That will be the impact to me and my neighbors that raise sheep, that we will sacrifice to have this Powder River Military Operations Area.

SO-15

I've been close to B-1s. My west ranch is in the current Powder River B, I believe. The closest that I ever came was when I was a student flying to Belle Fourche. I crossed the MTR. It's about halfway between Belle Fourche and the Butte/Harding County line and I was over a geographic feature that's called the Antelope Butte there. And I just happened to glance. I was scanning. I had a good instructor told me to scan. I looked back over my shoulder. I was less than a quarter of a mile away from him. He was bearing right down on us. I don't think he ever knew I was there. I dove for the ground and flew out of a 45-degree angle and I expected to be upside down. And I guess that was the right thing to do because I got out of there.

SA-7

I didn't think to report it because I don't think they ever knew that I was even there. I don't think they ever saw me. I was so scared that by the time I got to Belle Fourche, I didn't think about reporting it either.

And I see my time is about up. If I get more

time, I'd like to make more comments. Thank you.

HEARING OFFICER GREGORY: Well, I think you probably will get more time. But first I'd have to ask, is there anybody else?

MR. ROCK: Nobody.

HEARING OFFICER GREGORY: Okay. Well, as they say in football, put three minutes back on the clock. 2026

MR. NELSON: Well, a couple of things, Larry Nelson again, that have developed, I sent subsequent to when you held the scoping meetings here.

One thing that's happened is that USDA-APHIS Wildlife Services is now conducting predator control up here. That happened after that. And I assume that Merrill Nelson who runs the program in South Dakota has commented on this. SO-15

In addition, Keystone XL Company is planning on putting in a large 36-inch high-pressure pipeline through Harding County which will include two large pumping stations. CM-1

And thirdly, I also have a small gas field on my pastures, and I am really concerned about these flares. In your -- in your Executive -- in your Executive Summary there, if I can find my notes here, it said that one flare may drop every three SA-12

2026 (cont'd)

years. I think that's on Page ES-18 of your Executive Summary.

Those are the one flares that we're worried about. They land in the middle of that gas field on my place and start an incident there, we do not have firefighting capability in Harding County of controlling anything like that. All we need is one. SA-12

Chaff and flares: I don't like any of it, but we can probably live with it if you would limit the chaff and flare thing to the wintertime when the fire danger is a lot less. And they should not be dropped even at 2,000 feet when cattle and sheep are lambing on the prairie. Because it's not conducive to good animal husbandry to have chaff and flares scattered over a bunch of livestock trying to give birth to lambs and calves. SA-13 BI-5

The sage-grouse: Subsequent to your hearings, the sage-grouse has now been listed as warranted but precluded, which means it is on the list for -- the potential listings for an endangered species. BI-3

In the Belle Fourche paper, Marian Atkins who is the BLM Area Manager for South Dakota said that there have been no studies to document the effect of noise on sage-grouse. I don't know whether noise affects them or not. But you folks need to know

2026 (cont'd)

that because if there is and they help endanger -- get them to the endangered status and they get listed, you can quit flying, but we can't leave. We're still here. We're going to be left with an endangered species. And I'm again running out of time.

BI-3

HEARING OFFICER GREGORY: Ms. Gilbert, do you need more time, or do you want me to give another three minutes up here?

MS. GILBERT: He's saying it well.

HEARING OFFICER GREGORY: Okay. Sir, if you need another three, you can have it.

MR. NELSON: Well, I just -- I've lost -- again on the predator control impact, if while you're having one of these LFEs I believe is the term or that type of thing or other activities out there and I've got coyotes out there killing my sheep and I can't fly through for three or four days, who pays for those lambs? That's another direct impact.

SO-15

And there are thirty -- off the top of my head, 34,000 sheep left in Harding County. I think there's thirty plus thousand left in Butte County. The numbers have really gone down. And a lot of its predation.

In 1994, there were 11,000 head of sheep --

2026 (cont'd)

11 million head of sheep left in the United States. I've got the new South Dakota Ag Statistics books, and off the top of my head that number is a thousand -- excuse me -- 11 million head, but that figure now is about 6 million. And lamb prices are at an all-time high. But it doesn't make any difference what they are if you can't control the predators and keep going. And the reason we've got 34,000 sheep in Harding County is because we've had a good predator control program up here, but that will end if we can't do predator control.

SO-15

And I think I've really covered all the points that I wanted to cover, so thank you.

HEARING OFFICER GREGORY: All right. Well, we've got a lot of time left. I'll just ask, has anybody changed their mind about wanting to speak?

If not, as I've said several times, there's an opportunity to make written comments if you want to change your mind and want to comment on this proposal.

I want to thank you for your time and interest in this Powder River Training Complex EIS proposal. As I said, tonight's not the end of your opportunity to comment and participate in this environmental review process. Again, written comment sheets are

available on those tables out there. You can turn these sheets in tonight or mail them or fax them later. The mailing address is printed on the brochure and the comment sheets, and again, you see it up on the slide here.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process, but to receive timely consideration for the Final EIS, again please get those comments submitted by November the 15th, 2010. If you'd like your own copy of the Final EIS, please tell one of the representatives at the tables or send a letter or postcard asking for your copy and the Air Force will send copies of the Final EIS to you.

We have some time left, so I'm going to go ahead and recess the hearing at this point and remind you that the Air Force and FAA reps will be available at the boards if you'd like to continue talking with them.

So with that, thanks again for coming out. The hearing's in recess. Thanks.

(Hearing in recess at 6:52 p.m.)

HEARING OFFICER GREGORY: Okay, it's about 7:23 and the hearing's back in session. Mr. David Nieme

has approached me and said he'd like to make a comment, and so that's what we're going to do.

And, Mr. Nieme, the floor is yours. 2027

MR. NIEME: Okay. I'm David Nieme from Harding County or just north of Buffalo here. I'm a sheep herder. And the concern I've got is, reading your information brochure that came out about two, three weeks ago in the mail, was with the dropping of this chaff.

And with that chaff, why, it said it's aluminum and also some mild plastic products in it, and it gave some dimensions of the plastic streamers that will be included.

And the concern I've got is, if this is dropped over a band of sheep and if this plastic and even the aluminum fibers get into our wool crop, why, it's going to have a serious effect on our wool crop that we get shorn off and which is then packaged and shipped off to a woolen mill probably most on the East Coast, like South Carolina. SO-16

But that wool will go through a scouring strainer, get washed and cleaned and then it will go through a combing process and made into clothing. And that cloth will be just absolute snow-white and then that bolt of cloth will go through a dying

2027 (cont'd)

process to make the different colors, like the color of your uniform or whatever colors of clothing that it's going to be. And that plastic will not absorb that dye, and that will still show up in that cloth and make that bolt of cloth essentially worthless.

And with the trace-back ability for lot numbers on the woolen products that we take for sale, that liability will come back to us as producers.

And I guess my concern is, that if my wool crop turns out to be worthless or I've got some liability and I've gotta pay that woolen plant back their money for what they paid for my wool, why, that's going to have a harmful effect on my livelihood. Thank you.

SO-16

HEARING OFFICER GREGORY: All right. Thank you, Mr. Nieme.

MR. NIEME: Yeah, thank you.

HEARING OFFICER GREGORY: And with that, we are back in recess.

(Hearing in recess at 7:25 p.m.)

HEARING OFFICER GREGORY: There being no more speakers, this hearing is adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the foregoing Pages 1 through 44 are a true and correct transcript of the proceedings had.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

period. Second, if you agree with a previous speaker on something, you can certainly say that, but you don't need to use up your time repeating it since it's already in the record.

And finally, as I mentioned earlier, this isn't a Q and A session. It's an opportunity for you to put your views and your concerns about the proposal that you want the decision-makers to consider on the record. Questions that you pose during your comments will become a part of the record and will be considered.

After we're done with the formal part of this, the Air Force and FAA reps will continue to be available to discuss things with you out by the display boards.

With that, I'll go to the cards and call out our first speaker. Mr. Cody Krause with the USDA. Come on down.

2028

MR. KRAUSE: Okay. My name is Cody Krause. I'm with the USDA Wildlife Services. We currently operate an aerial program throughout the whole state in cooperation with South Dakota Game, Fish & Parks. It's a predator control program dealing with depredation on livestock on the area ranches.

We're currently flying close to 1100 hours a

year, which probably more than half of our hours is in this current proposed area. Much of it will be in Perkins County, Butte County, Harding County is where we spend a lot of our time. 2028 (cont'd)

We have two aircrafts, one out of Bison here and then our other is out of Spearfish, South Dakota. We are kind of concerned on the low-level flights. Most of our work is under 500 feet, but when we are doing our ferry time, we will be at 500 feet or above if we're ferrying safe from Spearfish to Bison or other areas. SA-1

But we're kind of concerned over obviously collisions or to see problems with these large aircrafts, as we are in the smaller Super Cub type plane.

I think that's about all I have to say, but thank you.

HEARING OFFICER GREGORY: All right. Thanks. Let's see. And I hope I get the name right. If I don't, please excuse me. Mr. Dwayne C. -- is it Vig?

MR. VIG: Yes.

HEARING OFFICER GREGORY: All right. It's live and ready to go, sir.

MR. VIG: Well, I certainly appreciate you

folks coming up. I certainly didn't intend to have any statement for tonight, but --

(Microphone malfunctions.)

MR. VIG: You just want 50 percent? Is that what you want?

HEARING OFFICER GREGORY: Put 30 seconds back on. The clock is not operating. There we go.

2029

MR. VIG: As I walked in the door, they asked me if I wanted to make a comment. I certainly wasn't prepared. I happened to run into Mr. -- Major Winters as he came in and visited just a moment. I've been to a couple other of these meetings. I recognize the representatives of Mr. Thune's and Mr. Johnson's office; worked over in Sturgis here a few months ago.

I certainly don't have any way to debate your specific items, and I appreciate Mr. Winters' presentation. I realize probably the biggest problem I have of this whole set-up is what I call an upper management attitude of the Air Force. They have all the answers and we'll just put up with whatever happens.

GE-5

I appreciate Major Winters' patriotism and his -- he said ten years. I realize that's rather inexperienced. I started 49 years ago and I've

flown this country from six inches off the ground to 45,000 feet with the airline. So I have a vague understanding, and my opportunity to serve in the United States Submarine Service in the '50s and '60s made me aware of the mistakes that are made during training.

2029 (cont'd)

We trained in the West Pacific and the East Pacific and the North Pacific and the South Pacific. Mistakes are made and that's why I get around my upper management attitude. And I'm not banging on you, Mr. Winters, or -- at all. It's just you need to learn, mistakes are made. And if it's a hot flare and it lands here last week when it's 90 degrees, we're going to have a major loss.

We have probably -- we're willing to -- how do you want to say it? We know what risk is. Everyone here probably has risk. And the risk of having a fire and losing hay land, winter pastures, or whatever is accepted, but with risk there's return.

SA-5

And this is where the two representatives from Mr. Johnson's and Mr. Thune's office, it's time for those folks who don't want the training area over the top of them maybe in Rapid City or Billings or downtown Omaha to step up and put a buck in on our land taxes, our property taxes.

SD-1

2029 (cont'd)

And like I say, you're setting amongst some of the most patriotic people in the world. And I thank you for your service over and over, but let's all share. And we can live with this, but let's all share and make it right.

HEARING OFFICER GREGORY: All right. Thank you, Mr. Vig.

Next, dealing off the top here, I've got Mr. Ross Reichert. Mr. Reichert. I think we've got the good mike for you.

2030

MR. REICHERT: Okay, thank you.

HEARING OFFICER GREGORY: All yours.

MR. REICHERT: I'm Ross Reichert. I'm concerned about this flyover deal. I'm in the sheep business and we use a lot of aerial hunting to control predators that eat our sheep and stuff, and I'm worried about the possibility of waves and stuff or them not being able to fly to protect our livestock. SO-15

I'm also concerned about the noise and what effect it will have on people and wildlife and animals and our general way of life. NO-5 LU-2

I guess we've -- we've lived in this -- my family's been in the country for 101 years and we -- we kinda live out in the boondocks because we want

2030 (cont'd)

Powder River - Bison 9/20/2010

Page 38

it quiet and we don't want a lot of noise and stuff, and I don't know if we can keep the flyovers from disrupting the lifestyle that we have today. LU-2

I guess with that, that's about all I have to say. Thank you.

HEARING OFFICER GREGORY: All right. Thank you, sir. Next I have Ms. Anita Lee. Ms. Lee.

MS. LEE: Hi. Do you need me to spell that?

HEARING OFFICER GREGORY: I don't think so.

2031

MS. LEE: Okay. I went to the one in Rapid City last week and I went through four ways that I have found that the landowners were compensated. Now, I won't go through that again tonight because after the meeting, the Commander from the Base was gracious enough to visit with me and he explained that they had no intention of compensating us because they will not be using live ammo. SO-1

He left out the fact that a dud flare is treated by them as unexploded ordnance, but that's beside the point. His point was, they had no intention of compensating the landowners. SO-1

So with that in hand, I did a little more homework and I went to just a basic law library under property rights. One of them is, another GE-7

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2031 (cont'd)

Powder River - Bison 9/20/2010

Page 39

property right that is often litigated and routinely protected is the right to reasonable and ordinary use of the airspace above your property. GE-7

Now, I won't read the whole book out of the -- page out of the book, but I will share with anybody after the meeting that is interested. But what that says is, the landowner does have the right to his airspace and, when it's taken to court, the landowner almost always wins. GE-7

Another taking of property is noise. The way they put it is, taking of the property by reducing its value is a taking. And it lists a bunch of things to decrease your value and one of them is noise. SO-1

And then there's another term which we don't use, but it's inverse condemnation. Now, what that means is -- everybody knows what eminent domain is. Okay. What this is, if the taker has no intention of using eminent domain, just takes your property, then the landowner has to start court proceedings, but the landowner can take the taker to court, and I've got a stack here of 25 or 30 cases where landowners have done this over training areas and won.

So I guess I want to say, I don't agree with

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2031 (cont'd)

Powder River - Bison 9/20/2010

Page 40

the Commander. We can and should be compensated. Am I out of time? SO-1

Okay. I -- last week we went to the Stockgrowers' Annual Convention in Rapid City and they unanimously passed a resolution opposing this Training Complex. And one of the points of this resolution, there again I won't read you the whole thing, but I've got it with me if anybody wants to see it after the meeting, is that damages should be handled on a local basis. SO-12

Now, just for fun I called the number in the Environmental Impact Statement four weeks ago. They have not returned my call. So if they're that far behind, that shows they need a little help here. GE-8

And there's several really good reasons why this should be handled on the local level. And I can see I'm about out of time, but if we do have extra time, I would like to have a couple more minutes later.

HEARING OFFICER GREGORY: I think we'll be able to do that, Ms. Lee.

MS. LEE: Do you want me to just finish now?

HEARING OFFICER GREGORY: Let me see if anybody has changed their mind and get these last folks and then you can go again.

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

Next I have Mr. Dennis Draxton? Did I get that right? Here you go, sir.

MR. DRAYTON: That was Drayton, D-R-A-Y-T-O-N.

HEARING OFFICER GREGORY: I'm sorry about that. We've got it as an "X." D-R-A-Y-T-O-N. 2032

MR. DRAYTON: Concerning the Powder River Training Complex expansion, it seems a request for an expansion is the norm for all of our government these days. In this particular case, it is an attack on where we live and it goes to the very heart of our only weakness: our low population. But as you can see by the attendance at these hearings, these few people have not yet relegated to the cities because that's the big boys and an even bigger reason to protest this expansion. LU-1

We grow weary of attending these meetings where we express our concerns to some faceless bureaucracy, only to hear later that our concerns were for not and plans will go ahead. NP-2

We that remain here value highly these expanses of relative peace and solitude where we accept the howl of winter storms and the roar of summer gales. LU-1

Now you come to tell us you want to introduce the roar of bomber jet engines and the after-burners of your fighters. To this request, we give a NO-5

2032 (cont'd)

resounding no.

The only shadows we want to see over our lands are those of clouds and the soaring hawks and eagles. We stand by our county resolutions and we will consider any expansion of flights at the very least an intrusion of our autonomy as citizens of these said states and counties. We wish to continue as our forefathers raising our children and grandchildren, calving and lambing in their seasons, and working the land free of any further encroachments. LU-1

For if there was only one of us left in this area and he was against this expansion, that would be cause enough for you to abandon your memorandums. NP-1

We believe that the freedom of our country and the preservation of our Constitution hinges on these principles alone, not on the expansion of the Powder River Training Complex.

Sincerely, Dennis Drayton. I submit this written for the record.

HEARING OFFICER GREGORY: All right. And I have the written comment from Mr. Drayton on that, so...

Next I have Mr. Lensegrav? Lensegrav? Did I get that right?

MR. LES LENSEGRAV: Yeah, pretty good.

HEARING OFFICER GREGORY: All right. All right.

MR. LES LENSEGRAV: Most people miss that.

HEARING OFFICER GREGORY: Oh, one for two. There you go.

2033

MR. LES LENSEGRAV: Thank you for this opportunity to speak here. My name is Les Lensegrav. I'm an ag producer and a pilot in the area proposed here in the Powder River expansion proposal.

I'm very much against this and I think that I represent we the people, and I think that's who is here today, is we the people. And it's time that we stood up for what we -- the rights that were given us. They're -- those rights were given us way back over 200 years ago, and I think that we've remained silent too long, and it's time that we stand up and speak our voices for whatever it is. My opinion, I'm against this.

GE-2

Each -- each person here I think today provides food for right at 100 people. And if that doesn't affect the environment, I don't know what does. We're the best caretakers of the environment that there is. And for proof of it, just step outside

LU-1

2033 (cont'd)

Powder River - Bison 9/20/2010

Page 44

the door and take a look across the country.

And one other thing, our Perkins County and I believe the Harding County Commissioners signed an agreement a while back against this, and I think that's on record.

Thank you very much for your time.

HEARING OFFICER GREGORY: Let's see. I know I had -- anyone else who hasn't spoken yet change your mind? Okay. Ms. -- oh. Can I get a card here? Just come on up.

2034

MR. PETIK: My name is Jerry Petik, P-E-T-I-K. And I'm sure glad the Highway Patrolman wasn't out this afternoon when I come through.

But anyway, I ranch in Corson County. My brother flies a lot, most every day after storms. And I guess I basically would agree with a lot of things that are said, although we do absolutely with no doubt need a very strong military and efficient. But then when you look at our southern border, I find some discrepancy in public action and public policies dealing with that.

I guess the thing I would like to ask is, is there any procedures or precautions taken -- that can be taken for people -- I'll turn around -- that fly that don't have a radio and would not be

LU-1

GE-9

AM-3

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2034 (cont'd)

Powder River - Bison 9/20/2010

Page 45

recording or talking to anybody about their flights? AM-3

Two examples I thought of since I came here is, one, is at a minimum, people would be able to find AM-12 out what might be happening in their particular area at a particular date. And the other would be if there would be a receiver that pilots could have so that they would be able to identify planes that AM-3 would be coming in their direction. I think that those two types of things may have -- or solve a lot of heartburn and a lot of agony for mothers and wives of those people that will be flying, so...

But again, I think that I speak for everybody here that we do appreciate what the military does. It's a question of do we need to -- do we need these PN-3 types of things; can they be done in another manner.

And I can -- on the way in I thought of two things, two times when the American farmers paid very heavy for American "Beef Heads" policies and there were embargoes on our crops and it hurt very dearly.

So we understand the need, but we also understand our contribution. Thank you.

HEARING OFFICER GREGORY: All right. Thank you, sir. Holly Waddell?

MS. WADDELL: Okay, thank you. I'm here

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2035

tonight on behalf of Dakota Rural Action. I'm currently the chair of this statewide organization. And I'm going to submit into the public record our resolution that was adopted by our membership in 2008 opposing the expansion of the Training Complex. And I won't read the whole resolution here because it will go into the record.

Just some of the points, probably some points you've already heard tonight; with noise levels being a concern for our livestock and families; some of the danger that might be presented to crop dusters, private air travel, ambulance aircraft. Let's see. Of course, the chaff and the fire danger possibility from duds that might fall on the grassland that we have out here, and some of chemicals that they also contain.

A big concern of our membership is the possible detrimental effects it might have on future development of wind energy. Dakota Rural Action is a strong proponent of wind energy of all sorts, bio-fuels, wind, bio-mass, bio-diesel, all of those that would help enhance the rural economies of our state, and we hate to see anything come in that would possibly have an adverse effect on developing those.

LO-2

SA-7

SA-5

SA-14

SO-17

2035 (cont'd)

So for those reasons again, I'm going to submit this as a formal part of the record. And just want to thank you for the opportunity to come and have a chance to express that.

Dakota Rural Action is a grassroots family agriculture and environmental group that works to organize South Dakotans to preserve our family farms and ranches and the environment and our unique way of life. So some of our members are impacted more than others by this and so they brought this resolution to our membership a couple years ago.

LO-3

HEARING OFFICER GREGORY: Okay.

MS. WADDELL: And it's available for review every year. And so last year it was recommended that we keep it as a standing resolution for our organization. Thank you.

HEARING OFFICER GREGORY: And, ma'am, I know you just came in, but if you want to submit written comments, you can leave them at the registration table.

MS. WADDELL: Okay, thank you.

HEARING OFFICER GREGORY: They'll take care of all that.

MS. WADDELL: Thank you.

HEARING OFFICER GREGORY: Anybody else who

hasn't had a chance to speak yet that wants to?

Okay, going back to those who have already spoken. Ms. Lee, I think you wanted to put another three minutes back on the clock, so I'll go ahead and do that for you as they say in football.

MS. LEE: You're very kind. I hate to be a mike hog. I do appreciate you listening to me twice. 2031 (part II)

But I would like to go on a little bit more about why the Stockgrowers feel that this is important to have these cases handled on the local level.

As these folks have spent two years working on this Environmental Impact Statement, we've had two years to study this. And I've done a lot of research. I have spent quite a little time looking into how claims are handled in other areas, and unfortunately they're usually not handled. In fact, most people just give up.

And personally we know that frustration. In the '70s we had some little missile bases in our -- in our area, and as the trucks drove around from time to time we'd have damage when they'd get in the wrong area and go through a fence now and then. It happened several times. And you'd call and nothing GE-8

2031 (part II)
(cont'd) 9/20/2010

Powder River - Bison

GE-8

would happen. You'd call, nothing would happen. After a while you quit calling. That's pretty much what happens. So it is I think very important.

There's quite a few examples that they probably wouldn't have the expertise. So, for example, your horse, okay. Sonic boom or a low flight spooked your horse. The horse went through the fence. What's the horse worth? I mean, is it an old plug that somebody needs to put down anyway, or is it your daughter's prize barrel racing horse? You know, in the first case, the vet bill's probably sufficient. In the second case, it's definitely not.

SO-13

Okay, so your husband's out spraying and the wind vortex moves the chemical from the summer fallow fields to the next field and suddenly you've got Round-Up on your field. Okay, what's a field? Is it your alfalfa that you're saving for seed that's got a beautiful stand, or is it a wheat field that's been hailed on three times? So they need an expert crop adjustor, which the Air Force probably does not employ.

SO-2

You can go on and on about cases where they really don't have the expertise and can't be expected to. So I think that's a very good point,

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2031 (part II)
(cont'd)9/20/2010

Powder River - Bison

that claims be handled on a local level.

And I would -- I would encourage all of you to talk to your Congress people. As far as I know, all three of our Congressmen strongly support this, but I would hope they would support us enough to help us a little. And I thank you all for your time.

HEARING OFFICER GREGORY: Anybody else? Anyone else? Whether you've already spoken or first time? Okay.

My wrap-up sheet here. Well, we have no remaining speakers. As I mentioned earlier, the Air Force and the FAA reps will continue to be available out by the display boards to discuss things with you.

I thank you for your time and interest in this Powder River Training Complex EIS proposal. Tonight's certainly not the end of your opportunity to participate in this process. Again, written comment sheets are available at the registration table. You can turn these sheets in tonight or mail or fax them later. The mailing address is printed on the brochure and the comment sheets.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process. To make sure your comments

receive timely consideration for the Final EIS, all comments must be submitted by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter or postcard asking for your own copy. The Air Force will send copies of the Final EIS to you.

There being no more speakers at this time, I'm going to go ahead and recess the hearing. Oh, sir?

MR. DAVE LENSEGRAV: Could I address Colonel Winters, please? 2036

HEARING OFFICER GREGORY: You can make a public comment if you'd like. But as I said, this isn't a Q and A thing, but you can certainly comment. Would you like to do that?

MR. DAVE LENSEGRAV: Yeah.

HEARING OFFICER GREGORY: Okay. Do you want to get a -- you can go ahead and come on up. We'll get that filled out later.

MR. DAVE LENSEGRAV: Dave Lensegrav. Well, I --

(Projector light shines on the speaker.)

HEARING OFFICER GREGORY: That will make you talk.

2036 (cont'd)

MR. DAVE LENSEGRAV: That's a bad one. Is that about what it's like when a B-1's coming at you?

Well, I guess I -- I would just like to ask a couple questions, and I don't know how I put that, you know, into vote.

But, you know, there's been several people that said that the Air Force will not compensate for losses, you know, and I would just like them to comment if this is true. SO-1

I also would like to know that from -- Ms. DeVine said about all this chaff and all this stuff that they've been dropping around Las Vegas for how many years, you know, just if this aluminum, you know, dropped on the environment, you know, how long they've been doing this. SA-27

You know, a lot of times it takes a long time for these things to show up. Because I -- that will be another question that I would like to ask for some people that are probably quite a little more knowledgeable than me.

Back in the '40s when they were doing all of this work on the bombs and stuff in Nevada, you know, and there was some detonations, you know, it was rumored that they waited for the jet stream to be just right so that all this stuff would be

2036 (cont'd)

Powder River - Bison 9/20/2010

Page 53

brought up into virtually the same area as here because they didn't want it in Los Angeles, they didn't want it in San Francisco, they didn't want it in Seattle, they didn't want it in Denver. Let's put it out there where it isn't going to affect very many people. Well, I'll tell you what. This is one of the hottest areas in the world as far as cancer. You know, we've had a lot of stuff dumped on us. I've had cancer, you know, and I've buried a lot of my friends from cancer. And I'm not an old bugger that should be dying from cancer yet. So that's some of the questions. SA-14

I would like you to address whether the Air Force -- you know, if they do have -- you know, there's going to be screw-ups, you know. Stuff happens. And I know with a flyover, I had my calves spooked a couple years ago, not from any airplane, who knows what, nothing, but they spooked. They got on the highway. We killed 17 of them. We wrecked two semis. What's it going to be like with one of those things roaring over? Thank you. BI-4

HEARING OFFICER GREGORY: All right. Anyone else? Anyone else? All right. Well, if -- okay. State your name for her so she can get it down.

MR. NASH: Dennis Nash, N-A-S-H. My concern AM-9

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

is, if this is a stepping stone from an MOA to a restricted airspace. If some day they wake up some day and they'll just say, "Well, let's exercise our UAVs." You can't do that unless you have restricted airspace. And if it's just that stroke of the pen will do it, make restricted airspace out of an MOA, I don't know. Thank you. AM-9

HEARING OFFICER GREGORY: Anyone else? Well, it's only 10 after 7:00 and we're not set to end until 8:00, so what I'm going to do, I'm going to recess the hearing, and the Air Force and FAA reps will still be available to discuss things with you. And Ms. Fink and I will be open down here until 8 o'clock if anybody changes their mind and wants to put something on the record, you can do that. We'll turn the machine back on and get your comment. Or as I mentioned several times, you can do the written comments, too.

So with that, I'll go ahead and recess the hearing at about 10 after 7:00. Thank you.

(Hearing in recess at 7:10 p.m.)

HEARING OFFICER GREGORY: It's about 7:55. We're back on the record. Mr. Drown has asked to make a comment. So Mr. Drown.

MR. DROWN: Yeah, Mr. White, I don't know his

rank, he went ahead and explained to me, I was late coming to your meeting, but the way he explained it to me, Alternative A, or the first choice, seems like it should work for this area in my opinion. I was most concerned about low-level flying and rumors that I had heard that it would preclude any possible future wind power development in our area.

And from what I understand from their answers, him and a couple other folks, there's no -- it has nothing to do with that. Of course, there's other types of agencies that would, and we understand that.

SO-17

But the story that we had heard that got us concerned was that it being the practice area for aircraft would cause it so it would be illegal to put any wind power development.

And I don't see any problem in my professional judgment with your project, and glad this part of the country can help.

GE-1

HEARING OFFICER GREGORY: All right. Thank you very much, Mr. Drown. Would you mind just filling out this card for the folks. Just put your name.

(Brief pause.)

HEARING OFFICER GREGORY: Well, it's 8:00 p.m. And there being no more speakers, this hearing is

adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

My Commission Expires: 4-29-2016

finally, as mentioned earlier, this isn't a Q and A session. It's an opportunity for you to put your views and your concerns about the proposal that you want the decision-makers to consider, put those on the record.

Questions that you pose during your comments will become part of the record and will be considered, and then after we're done, as I mentioned at the beginning, after we're done with the formal part of this, then the Air Force and FAA reps will still be available by the charts and all that stuff outside to discuss anything that you'd like to discuss with them.

Okay. Well, with all that, I'll go ahead and get our first speaker up here. How about Senator Bowman?

SENATOR BOWMAN: Okay. I've never got up in front of a group of people and had a limitation on how long I can talk.

HEARING OFFICER GREGORY: Well... 2039

SENATOR BOWMAN: But I know that there's been a few concerns dealing with this. I know that until we actually do it, we're not really going to know what the impact is going to be. And if you deal with things after the fact and can't change it, then

GE-10

2039 (cont'd) Page 35

the problems are going to get greater.

If you could have a test-run and then come back and have another meeting when the public then knows exactly what's going on, it might be the best thing that you can do. That's my suggestion from what I've heard.

6E-10

But until we actually have these planes flying at the various speeds that they're going to fly and the elevations that they're going to fly, we don't know.

I can tell you from my experience when I ranched north of Rhame, the first time the stealth bomber flew over. I didn't know there was any bombs like that. I didn't even know what it was. And it came in from behind me. And when it got to the other side of me, that's when I heard it. And I thought the tractor was going to blow up. But if I'd have known before that it was going to come, I'd have been prepared for it.

And that's what my point is right now from what I've heard. I've heard a lot of people have a lot of discussions about this and they have a lot of concerns. But until we actually do it and then have a public meeting, I don't know if we can really address the real concerns until that's done. Thank

you.

HEARING OFFICER GREGORY: All right. Thank you. I think you had plenty of time. But if you want more, I think you'll probably have a chance later.

Let's see here. Next I have Pine Abrahamson. I hope I've got that right. Here you go. 2040

MR. ABRAHAMSON: I guess I just got a couple concerns. Bowman County is thinking about building a new airport, and this airport is part of our energy in our county and our state. It brings people in and out of there with the oil. They're not always predictable when they're going to show up and when they're going to leave. And that's -- it's kinda got a concern for me because oil is part of our state and part of our growth. If they can't come into our county or into our city and leave when they want to, it's kind of a downfall for our community. SO-10

HEARING OFFICER GREGORY: All right. Thanks, sir. Next I have Mr. Darin Langerud. Mr. Langerud. I hope I got that right.

MR. LANGERUD: You did.

HEARING OFFICER GREGORY: Excellent.

MR. LANGERUD: My name's Darin Langerud. I'm

2041

the Director of the North Dakota Atmospheric Resource Board in Bismarck. The ARB is a division of the State Water Commission. We're charged with the regulation of weather modification activities in North Dakota. Each summer, the North Dakota Cloud Modification Project conducts airborne cloud seeding operations to enhance rainfall.

(Off-the-record discussion.)

HEARING OFFICER GREGORY: Don't count this discussion as part of his time.

THE COURT REPORTER: If you could start over, that would be great.

HEARING OFFICER GREGORY: As they say in football, put three minutes back on the clock.

MR. LANGERUD: All right. The North Dakota Atmospheric Resource Board which is a division of the State Water Commission in North Dakota is charged with the regulation of weather modification or cloud seeding activities in the state. Each summer, the North Dakota Cloud Modification Project conducts airborne cloud seeding operations to enhance rainfall and suppress hail from convective clouds from the months of June through August. The 2009 economic evaluation shows that cloud seeding operations in southwest North Dakota contribute

SO-2

2041 (cont'd)

Powder River - Bowman 9/22/2010

Page 38

$3 million annually in additional crop revenues and $9.2 million in gross business volume annually.

The current cloud seeding program includes Bowman and part of Slope County which lie under the PR-3 expansion of the PRTC. Also, Gaps B and C MOA/ATCAAs adjacent to PR-3 are in close proximity. We are committed to working together with the U.S. Air Force so that both PRTC and NDCMP missions can be accomplished.

Regarding flight operations, the EIS recognizes that weather modification and cloud seeding activities could be affected by the proposed PRTC. The general recommendation in the EIS is to notify Ellsworth Air Force Base of the possibility of cloud seeding operations and work with them to deconflict training missions.

Weather modification aircraft operate under Visual Flight Rules. However, Instrument Flight Rules are also occasionally conducted in this area which are typically conducted between flight level 160 and 240. The EIS indicates that civil aviation would not be prohibited under VFR conditions even when the MOA is active, and that civil and military aircraft would operate under VFR see-and-avoid rules. IFR flights, however, would be prohibited

SO-2

GE-11

AM-13

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2041 (cont'd)

Powder River - Bowman 9/22/2010

Page 39

when the MOA is active, a potentially significant impairment to effective cloud seeding operations.

This raises two questions: Will prior notification of Ellsworth Air Force Base regarding active weather modification seeding flights deconflict the affected area under an active MOA to the extent that IFR cloud seeding flights can be conducted, and also, will that prior notification regarding VFR seeding flights deconflict the affected area for military aircraft, or will they operate in the area where seeding is ongoing and will see-and-avoid rules be enforced.

The final issue has to do with radar countermeasures. The Draft EIS outlines also the planned use of chaff as a countermeasure for radar detection. We operate a weather radar at the Bowman Airport for assistance with weather detection and flight operations logistics.

Chaff fibers of 1 inch which are outlined in the EIS are exactly what you would want to jam a 5 centimeter wavelength radar which is what we operate here in Bowman. Thus, it's plausible to suggest that the use of this chaff during training could produce high reflectivity radar echoes, which could be detected by the Bowman radar and not

AM-13

AM-12

SA-15

SA-16

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2041 (cont'd)

Powder River - Bowman 9/22/2010

Page 40

associated with clouds or precipitation.

Further, prior research has indicated that military chaff has very slow terminal fall speeds and can persist in the atmosphere for long periods, deposited many miles downwind. The Draft EIS recognizes that chaff can be "detected by improved FAA radars, so to ensure that no chaff cloud interferes with ATC, chaff would not be deployed within 60 nautical miles of airport approach radars."

Our question would be, due to the importance of radar during cloud seeding operations, will the U.S. Air Force forgo the use of chaff within the same 60 nautical mile range of the Bowman radar as it proposes with FAA approach radars.

The proposed actions in the Draft EIS regarding cloud seeding operations in southwest North Dakota indicate that the Air Force is willing to cooperate with the existing users of the airspace so that all missions can be accomplished. However, we request further clarification on the aforementioned issues to ensure that this important and longstanding program can continue to be effective. Thank you.

HEARING OFFICER GREGORY: All right. Next I have Mr. David Hellard. Mr. Hellard?

SA-16

SA-16

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

MR. HELLAND: David Helland, H-E-L-L-A-N-D.

HEARING OFFICER GREGORY: Oh, sorry about that.

MR. HELLAND: My concern is basically as a pilot in the airways and their flying and the concerns of mid-air collisions.

I heard this, that you said they were going to fly below -- or not below 500 feet. Where that's an interesting concept, but reality is, they fly below that. SA-1

And I almost had a mid-air collision with a B-1 bomber when a New England training sabbatical was active but it was with my truck. They literally went around me at approximately 150 feet, went around and up and lit the after-burners, went up through a solid thousand foot overcast. An extremely impressive sight, but very dangerous. In a truck, it wasn't a big deal. But had I been flying a small airplane, it would have been extremely hazardous.

So where the concept is that they're 500 feet, the reality is, they do fly below that. And they were hot-dogging, or using me as a target, and that's -- that's dangerous and we just can't have that. So that would be my concern as a pilot. AM-14 SA-17

Thank you.

HEARING OFFICER GREGORY: All right. Thanks, sir. Next I have Mr. Rodney Schaaf. Mr. Schaaf.

MR. SCHAAF: Thank you, Colonel. Schaaf --

HEARING OFFICER GREGORY: Sorry.

2043

MR. SCHAAF: -- S-C-H-A-A-F.

First of all, I would like to thank Ms. DeVine for coming up from the East Coast. Sometimes, I guess speaking for a majority of the people here, we feel our voices aren't heard out here in the rural areas from the people down there in the D.C. area. So welcome to Bowman.

Again, Pine hit the nail right on the head. We are blessed here in western North Dakota with energy: oil, coal, natural gas, potential for uranium, methane recovery, and we want these corporate jets to come into our new airport.

SO-5

And our concern again is this 500-foot low area that's going to be on PR-3 right over the top of us. We're glad to see in the final draft that just about all the concerns I think everybody had here was mentioned, but we were kind of disappointed that no recommendations were followed. And the main one we had was keeping us as the high area, say above 10,000. You can do what you want above there, but leave us alone below.

DO-4

2043 (cont'd)

And the next one was communications and radar. And as I read through the draft, basically they said they weren't going to do anything about it. I don't know if it's cost or just terrain or the quality of the radar. AM-3

And so in summary, people live out here. We do our jobs and raise the kids, pay taxes, and last but not least, we do support our men and women in uniform. And so we realize the importance of training, but with all these scoping meetings, there's gotta be a compromise between everybody affected.

So we were hoping some of our recommendations were included. Maybe they will be in the final draft. Thank you. NP-2

HEARING OFFICER GREGORY: Thanks, sir.

I've been through all the speaker sign-up cards that I have. Did anybody else who hasn't spoken yet want to say anything? All right. Since we have plenty of time, would anybody who has already spoken want to add to what you've already said? Okay.

Well, since we have no remaining speakers, as I said earlier, the Air Force and FAA reps will certainly be available and continue to be available. We're not due to be out of here until 8 o'clock.

That's about an hour from now. And they will be by these boards and various things to discuss things with you.

I thank you for your time and interest in this Powder River Training Complex proposal. As I mentioned earlier, tonight's not the end of your opportunity to participate in the review process. Written comment sheets are available over at that table. You can turn these in tonight or mail or fax them later. The mailing address is printed on the brochure and on the comment sheets.

The Air Force welcomes public comments in writing at any time during the Impact Analysis Process, but as I said at the beginning of this, to receive timely consideration for the Final EIS, you need to get those in by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives out there or send a letter or a postcard asking for a copy and the Air Force will send copies of the Final EIS to you.

Since we're well before 8 o'clock, you'll have more opportunity to discuss things with folks. I'm going to recess the hearing, but if anybody changes their mind about wanting to speak, just come back in

here, let me know, and we'll crank the machine back up and get your comments on the record.

But at this time, I'm going to go ahead and recess the hearing. Again, thanks for coming.

Let me put on the record what a beautiful facility that Bowman has. I'm just sitting here admiring this timber framework. It's outstanding; prettiest I've seen.

All right. We're in recess.

(Hearing recessed at 6:55 p.m.)

HEARING OFFICER GREGORY: It being 8 o'clock, and there being no more speakers, this hearing is adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the forgoing Pages 1 through 45 are a true and correct transcription of my stenographic notes.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

That is the purpose of the comment period. Second, if you agree with a previous speaker on something, you can certainly say that, but there's no need to repeat what they said since it's already recorded in the record here. And finally, as I mentioned earlier, this isn't a Q and A session. It's an opportunity for you to put on the record your views and concerns about the proposal that you want the decision-makers to consider. Questions that you pose during your comments will become part of the record and will be considered.

After we're done with the formal part of this, the FAA and Air Force reps will continue to be available out by these displays to discuss things with you.

With that, we'll move to the cards. And let's see. I've got Jerry Kling, Kling Ranch. I think we've got a microphone down here.

2044

MR. KLING: My comments were, the last time these planes flew over our ranch, it was nearly a daily deal to take dead livestock out that had hit the corrals, broke their necks, broken legs. I would call Ellsworth Air Force Base. They asked the nature of my call and I would sit on that phone. You could sit there all day and never get anybody to

BI-4

GE-8

2044 (cont'd)

Powder River - Elgin 9/23/2010

Page 35

respond. This was almost daily. And I was just wondering if this was going to be the same kind of deal. GE-8

But they said that no planes were lower than 500 feet. When they shake the stuff off the shelves in the house and nearly break the windows out of the house, they deliberately used our feedlot and our buildings for targets, and it was really upsetting and disturbing. I just hope that that doesn't happen again. It would put me out of business again if they do that again. SO-18 AM-15 SO-6

And I guess that's all I had to say. But I just hope it doesn't happen like before.

HEARING OFFICER GREGORY: All right.

MR. KLING: I do think that we need the Air Force and I'm proud that they do the job they do. GE-9

HEARING OFFICER GREGORY: All right.

MR. KLING: So...

HEARING OFFICER GREGORY: Thanks for putting those concerns on the record.

The next speaker I have is Mr. Shawn -- is it Weishaar? Did I get close to that?

MR. SHAWN WEISHAAR: Yes. It's Weishaar, W-E-I-S-H-A-A-R. Can I start?

HEARING OFFICER GREGORY: You're good.

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

MR. SHAWN WEISHAAR: Okay. First, I would like to thank both of you for your service. Like Jerry, I also appreciate what the U.S. Air Force and all our Armed Forces are doing for us on a daily basis. GE-9

Our biggest concerns are, I grew up living under a low-level flight path for a good chunk of my years I grew up. And I've read parts of the EIS statement, and here's my biggest concerns with it.

I don't think they've taken into account the effects of property values with these fly-overs, and the only thing that uses unit comparison is interviews with appraisers from southeast Montana. SO-1

We all know that our area has a higher population density than those areas, and I don't think the appraisal studies were documented in this situation to address more of the rural residential properties in our area. SO-19

And the only effect -- or the only thing we can do as a landowner is declare inverse condemnation which is time-consuming and costly. SO-1

And nothing is mentioned in this EIS about navigation and hazard easements that could be in place because of property adversely affected by low-level flights. SO-22

I think this part of the EIS statement on property values is extremely weak.

Next thing I noticed is, the EIS does not SO-20

identify feedlot and livestock backgrounding operations. The assumption is that we would round up cattle once a year to brand and we round them up once more to send off to lien. We have a tremendous amount of people that background and feed calves anywhere from a month to year-round in this area, and they've not been identified in this Environmental Impact Statement. SO-20

They haven't taken into account the number of crop land acres that will be coming out of CRP in our area in the next few years. We're already seeing some of this happen. We have more continuous crop, more no-till. We have a lot more aerial spraying going on than we had 10 years ago. I think this would be detrimental to our aerial applicators to the point where they may not even want to work in this airspace because of it. LU-4 SO-2

Finally -- or not finally, but I think the EIS is extremely vague on where they're going to put these threat emitter sites. How much more land is the Air Force looking to acquire to put these in? Are they using the promise of no low-level flights over an operator's farmstead to -- as a bargaining chip to get a low-level -- to get a threat emitter site put in? In the past, they've always been in a CM-2

way just -- in a spot away from the flight path and they -- very seldom a flight would go over the top of them.

And nothing is mentioned in this EIS statement about the previous landowners and residents that were affected by past activity. And I can tell by looking in the crowd who you are because you all know what I'm talking about. SO-21

Having grown up under this, I -- it was not uncommon to be woken up in the middle of the night. I have four children. I don't want them to go through that.

I think we can stay away from the farmsteads, feedlots, backgrounding areas. If we can't avoid some of these areas on flights, I don't know how we can fight the enemy in a hostile territory. NO-10

With that, that's all I have to say.

HEARING OFFICER GREGORY: All right. Thanks a lot, sir. And again, if you have written materials that you want to add, those can be added as written comments any time before November 15th.

The next name I know I'm going to get wrong and I apologize to whoever it is in advance. Roger Kinnischtzke?

MR. KINNISCHTZKE: Well, you can pronounce it

Kin-ect-si or Kin-ish-ke.

HEARING OFFICER GREGORY: Kinnischtzke.

MR. KINNISCHTZKE: There's two versions.

HEARING OFFICER GREGORY: Okay. Well, sorry about that.

2046

MR. KINNISCHTZKE: That's okay.

HEARING OFFICER GREGORY: There you go.

MR. KINNISCHTZKE: You're not the first one.

I'm a farmer/rancher from, well, the Grano area actually. So -- I'm also a pilot. And I'm concerned about the expansion of this. It's going to cover a lot of farmers and ranchers.

And I would like to see it stay the way it is. I think it's been working pretty good. We have our wildlife I think is an issue. We're in a prime hunting area. And, you know, when our Vice President Cheney was here, a rancher couldn't go out and check his cows because he'd have been highly illegal. And so I'm a little concerned about too much government too close by for our food and livestock protection and production.

And I think looking down the road, hopefully our people from Afghanistan can come home pretty soon. And down in the future, in years from now, maybe we don't need quite as much protection as what

PN-2

LU-5

GE-5

PN-3

2046 (cont'd) Page 40

we're trying to come up with here today. And if we do have to have it, I'd like to see it here in the United States; bring some of our people back. PN-3

And I don't know how this is going to affect our proposal, but I would like to see it stay the same. Thank you.

HEARING OFFICER GREGORY: All right. Thanks, sir.

Next I have Georgene Goeres. There you go, ma'am.

2047

MS. GOERES: I have this memorized, but I'm going to read is so I get it all in.

Thank you for making this important meeting a priority tonight and thank you to the Air Force for giving us this opportunity to express our opinion.

This is the epitome of America: public meetings, the right to express an opinion, pro or con, without fear of retaliation; one of the freedoms our military affords us. NP-3

I think most of us here tonight have strong family history of military service. I know our family does from the Civil War to this day and this hour, this minute, and this second right now. We are proud of our military, we respect our military, we honor our military, and we know up close and GE-9

personal firsthand what they do for us. Our military is number one in the world; always has been, always will be.

GE-9

That being said, I know there are millions and millions of square miles already dedicated to our military forces on the ground and in the air for bases, artillery ranges -- excuse me. I'm running out of air.

HEARING OFFICER GREGORY: Just take your time.

MS. GOERES: -- moving grounds, bombing ranges, and elusive maneuver ranges. I know that at least six foreign countries train with our pilots in Nevada: Germany, United Kingdom, Canada, and several others. I know that the German Air Force has trained in the United States since the '40s and '50s up to this day, mostly in White Sands, New Mexico.

PN-2

I believe we have the ground and airspace already in place all across these United States to keep us number one in the world.

PN-2

I believe this proposed expansion is an expansion of convenience for Ellsworth and Minot Air Force Bases. I do not believe it is a necessary expansion for national security.

PN-3

I live 19 miles south of Elgin and we were there when the bombers and fighter planes were here

Powder River - Elgin 2047 (cont'd) 9/23/2010

years ago, and I do not want to return to that for many, many reasons, most of which will be addressed by all of you.

Don't let anyone guilt you into thinking you are un-American or anti-military if you do not go along with this proposed expansion. One issue has nothing to do with the rest.

In conclusion, the Stockmen's -- North Dakota Stockmen's Association is holding their convention today through Saturday at the Holiday Inn in Minot. There will be a discussion and vote on this topic tomorrow at 1:00 p.m. their time. You have to be a member to vote, but you don't have to be a member to contribute to the discussions. If you're going to be in Minot, please make that session a priority.

Thank you for your time. And God bless our military and God bless America.

HEARING OFFICER GREGORY: Thank you, ma'am. Next I have Mr. Dan Stewart.

MR. STEWART: Thank you. That was very well said, by the way. 2048

I'm the Chairman of the Grant County Commission. And so one of my other fellow Commissioners is here tonight. We've discussed this a little bit. I also ranch 35 miles southwest of

Powder River - Elgin 2048 (cont'd) 9/23/2010

Page 43

here -- southeast of here and remember like some of the others here those big planes flying through back in the '80s, '70s and '80s.

My biggest concern is, what happens if we do have a wreck on the ranch and we kill some livestock? How do you get that reimbursed? We've just got done dealing with FEMA over the last several years and I know what an extremely, extremely slow process that is to deal with the federal government when it's time to get money from them to you. SO-13

And I'm fearful that we have producers out here who once a year pull their once-a-year paycheck off their cows and put them in their feedlots and have a wreck and lose 10 or 12 or 15 or 20 head of livestock that might mean the difference between making it or breaking it for their entire family and have nobody on the other end of the phone when it's time to try and get some relief from that. That's my biggest, biggest concern. SO-13 SO-12

I want our military to continue to be the best that it is. I've had an opportunity to fly a few different places this last year and we flew to Reno, Nevada, not too long ago. There's a lot of desolate area down there. I didn't see a cow for two hours GE-9 PN-2

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

of flight time. There's gotta be someplace to fly down there, boys. PN-2

And you're talking about western North Dakota where we raise the best cattle in the world and we're proud of that. And these guys want you to know that; that this isn't something we do on the weekends. LU-3

My family's fifth generation and there's lots of long-time generation ranchers here that take a large amount of pride in what they do, just like we have pride in our Air Force. But these are our livelihoods, and we want to be able to protect that as much as we possibly can. Thank you. LU-1

HEARING OFFICER GREGORY: All right. Thanks, sir.

Next I have Mr. Dan Maher. Mr. Dan Maher.

2049

MR. MAHER: Thank you. I'm Dan Maher. I don't think this is a question of patriotism at all. One-sixth of the population of the United States lives in rural America, but yet rural America supplies 40 percent of our military people. So, you know, I think we're fairly patriotic and we do commend our military for the things they do do.

But as the speakers before me said, what do you do when your calves break out from something like SO-12

Powder River - Elgin 2049 (cont'd) 9/23/2010

Page 45

this, you know. It's your livelihood we're fighting for. What we would really like I think is a name. Who do we call and a phone number and somebody that's there to answer it and take care of our problem; not somebody that puts you on hold, you know.

SO-12

Like the guys before me said, you know, when calves break out, you're probably lucky if they break out or you've got a dozen of them laying along the fence with broken necks. They break out, then you gotta go chase them down probably four miles away. It takes you days to get them back. Then you gotta settle them down, and you gotta fight it for the rest of the winter because they're spooky. If something coughs, they're probably ready to go.

So I guess that's where I come from, you know. It's what -- what these guys are fighting for every day. So thank you.

HEARING OFFICER GREGORY: All right. Thanks, sir.

And next I have Mr. Dennis Drayton.

2050

MR. DRAYTON: Yes. I'm Dennis Drayton. I live at Lemmon, South Dakota, but we call our place Drayton Ranch of the Dakotas. We moved up here not so long ago and ranch and pay taxes on both sides of

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2050 (cont'd)

the border.

After scoping the Air Force's in-depth study of the environmental impacts, they have considered all the aspects and most of the time come to the same conclusions as we have; that the whole plan, if implemented, will damage fences and corrals, disband sheep, make riding horses more risky, startle us, shake our homes, and contribute in general to a more stressful life for all. This is all a given. LU-2

And you haven't heard many of us talk about environmental impacts. It's all about the people that are living out here and being able to tell somebody that -- our wishes and then have somebody that we elected take action on them.

But let us be clear. As I said, there's much more than the environment at stake. As my good friend Shawn Weishaar said after looking at the map the other day, "This is nothing if not a taking," clear and simple. SO-1

Well, ladies and gentlemen, he has hit the nail on the head. We are all here because we are property owners. And, as American citizens, we're endowed with certain inalienable rights of life, liberty, and the pursuit of happiness. And that to secure these rights, governments are instituted

2050 (cont'd)

among men, deriving their just powers from the consent of the government.

All of our lands are historically important, having been trod on by the earliest man and animals to the present time. None are more important than what we personally own, regardless of the lists that have been made. Now the government has parlayed with the various Tribes and found that the representatives all voiced their opposition to their inclusion in an expanded training complex.

The Air Force has seemingly agreed that on certain circumstances they would try to avoid Tribal life and activities, at the same time being mindful of the impoverished children thereon. EJ-1

In contrast, we other citizens of these areas come in even greater numbers to voice our opposition while those we elect to congress abandon us and essentially offer up our lands as sacrifice in the interest of keeping the Air Bases open. It's as simple as that. NP-2

So don't spend too much time conferring with these representatives because they are not here to offer sympathy, nor do they owe us any allegiance in this issue. We must focus our efforts in making our congressmen and women accountable to our wishes.

2050 (cont'd)

Powder River - Elgin 9/23/2010

Page 48

HEARING OFFICER GREGORY: All right. Thanks, sir. And if you have written more material here, you can put that in as a written comment.

Anyone else like to speak for the first time? Anyone? Because that's the last speaker card that I have. Anybody? Is there anybody who's already spoken that would like more time to add to what you already said? Anyone?

Come on back. Put another three minutes back on the clock.

MR. DRAYTON: It won't take that long.

HEARING OFFICER GREGORY: That's all right. Take what you need.

MR. DRAYTON: Now, did you notice tonight that these representatives of the Air Force and the other entities have brought no goods to trade with us, no offers of compensation nor recompension. Remember, all the trading was done before they arrived here by the cooperative agencies and those whom we trusted to act in our best interests. All the federal agencies arrayed against us play nice with each other while we have to play hard ball.

SO-1

NP-4

If we cannot prevail in this issue, if our voices and desires are not heeded, a black curtain will have been dropped over the faces at Mount

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

Rushmore. Will we, just as the Lakota, the Crow, the Cheyenne before us, be left to cry a trail of tears? We will see. We will see.

HEARING OFFICER GREGORY: All right. Thanks, sir. Anyone else?

Would you just state your name one more time.

MR. MAHER: Dan Maher. Everything that we heard tonight is all low impact, you know, minimum impact. But right here it says flare development: discontinued when fire danger rating beneath airspace is extreme. Well, when do fires start? They're not waiting for it to get extreme, I'll tell you that.

2049 (part II)

SA-5

HEARING OFFICER GREGORY: All right. Thanks. Anyone else? Come on back.

MR. SHAWN WEISHAAR: Shawn Weishaar. Just a few more things to add.

I'm really concerned about how we will be perceived economically if this goes into effect. I think we've really had a lot of things go for us lately. We've seen new people move into our area. We've seen a lot of people buying 40-acre farmsteads. They like to live out here and they like to hunt out here. And I can't imagine showing a property for sale and having a B-1B do a low-level

2045 (part II)

SO-1

2045 (part II)
(cont'd) 9/23/2010

Powder River - Elgin

fly over the top. It would kill the sale right away. I can guarantee that. They would find other options. SO-1

I think we made a lot of headway. We've got some things going with wind development. We've got -- we don't see vacant farmsteads any more. Those are all -- those old ones are all falling over and abandoned, but when a farm sells, it's -- you're more apt to see the farmstead separated from the rest of the property, and that's because somebody's willing to live out there 30 miles just to enjoy the peace we have and the quiet and the tranquility. SO-17 LU-2

And I think that's one of our major selling points, and I'm really worried about losing that because we made some strong headways in the last ten years and we're not what we were in the '80s.

HEARING OFFICER GREGORY: All right. Thanks. Anyone else? Anyone?

Well, I tell you what I'm going to do. It's not set to end until 8:00 p.m. So I'm going to recess the hearing at this time and, as I mentioned earlier, the Air Force and FAA reps will be available out by those boards to talk anything over you want.

But for now, let me just remind you that -- if

I can get to the right page here.

As I said earlier, tonight's not the end of your opportunity to participate in this process. Written comment sheets are available at the registration table. You can turn these in tonight or you can mail or fax them later. And I'm blocking the slide there. Sorry about that.

The mailing address is printed on the brochure and the comment sheets. The Air Force welcomes comments in writing at any time during the Environmental Impact Analysis Process, but as I mentioned at the start, to make sure they get timely consideration for the Final EIS, please submit those comments by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the table or send a letter or postcard asking for your own copy and the Air Force will send copies of the Final EIS to you.

And there being no more speakers at this time, I'm going to recess the hearing. And if you change your mind and want to make a statement or add to something you've already said, all you have to do is come back up here, find me, and we'll turn the machine back on for you.

So with that, we'll be in recess. Thanks again for coming out tonight.

(Hearing in recess at 7:10 p.m.)

HEARING OFFICER GREGORY: All right. The hearing's back in session and Mr. Weishaar would like to make some additional comments.

2051

MR. BEN WEISHAAR: Yes. My name is Ben Weishaar. My last name is spelled W-E-I-S-H-A-A-R. I am a retired Delta Airlines employee. And what I would like to do is, I would like to make aware of a couple points that I think the Air Force should address.

Number one is, the flight plans for this area should be regulated because Delta Airlines at this time is trying to establish a route from Salt Lake City to Bismarck, North Dakota, and the airline that would be flying us would be Sky West Airlines which flies a smaller two-engine airplane. So I would like this brought to their attention so that this will not interfere with Delta's plans.

AM-1

The second point that I would like to address is, they mentioned bird strikes, and the bird that they forgot to mention is the Canada goose. The Canada goose is a much bigger bird than any of these other birds that they were talking about and it

SA-10

2051 (cont'd)

SA-10

flies much higher.

For example, I don't know if it was a Canada goose or not, but I was working down at Phoenix, Arizona, for Delta Airlines in the early '90s and we had a bird strike on the radome at 35,000 feet. And we don't know what type of bird it was, but he put a dent in it about a foot deep. And this radome is made out of fiberglass in the front of the plane. That's all I have.

HEARING OFFICER GREGORY: All right. Thanks, sir.

MR. BEN WEISHAAR: Thank you, sir.

HEARING OFFICER GREGORY: With the conclusion of the comment, we'll go back into recess.

(Hearing in recess at 7:20 p.m.)

HEARING OFFICER GREGORY: Well, it's 8 o'clock. And there being no more speakers, this hearing is adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

My Commission Expires: 4-29-2016

formal part isn't a Q and A session. It's an opportunity for you to put on the record your views and concerns about this proposal that you want the decision-makers to consider. Questions that you pose during your comments will become part of the record and will be considered.

Of course, after we're done with the formal part, the FAA and Air Force representatives will continue to be available to discuss things with you back around all those display boards.

And with all that, I'll move to the comment cards. And let's see. I'll just deal off the top here. I have Matt Davila. Did I get that right?

MR. DAVILA: No.

HEARING OFFICER GREGORY: No? Sorry.

MR. DAVILA: Davila.

HEARING OFFICER GREGORY: Matt Davila. Go ahead and spell that for her.

MR. DAVILA: Davila is D-A-V-I-L-A. I know this is not a Q and A meeting, but I just -- I was talking with the liaison earlier today and I wanted him to explain some of the possible test flights that were going on and -- back in '93 and '95.

You guys showed the borders of the proposed patterns or whatever. And I can't remember what we

2052

2052 (cont'd) Page 35

were talking about. I can't remember how that went. But that was in existence before.

But I moved here from Denver, and living out seven miles outside of Selfridge which is -- there's nothing there, but I saw -- what I saw is the whole state line light up and something came flying towards -- well, now that I saw the map, over Bullhead and over towards Selfridge/Porcupine area and then shoot straight across west.

You guys mentioned also about the FL, the flight levels being 45,000 and 5,000. And I explained to the gentlemen, the two people earlier, that these crafts were lower than that. But if you could -- I guess if you guys can explain that, that would kind of clarify. Because the altitude or whatever, the feet that -- the 5,000 feet that -- the minimum flight levels, I guess.

DO-1

HEARING OFFICER GREGORY: Let me just clarify that. Was that 5,000 or 500?

COLONEL ELDRIDGE: 500.

HEARING OFFICER GREGORY: 500.

COLONEL ELDRIDGE: 500 feet above ground level. You bet. 500 feet.

MR. DAVILA: But on your pamphlet it says 5,000.

HEARING OFFICER GREGORY: It should be 500. That's why I wanted to clarify that. All right. Thank you.

Let's see. Next, I have -- hope I get this right -- Mr. Jesse Taken Alive. Sir.

2053

MR. TAKEN ALIVE: I'll sit right here so she can hear me.

Welcome to Standing Rock, Air Force officials, government officials. My name is Jesse Taken Alive. I'm a member of the Tribal Government here at Standing Rock.

And I need to race through this unfortunately, but I will touch as to why I'm racing through this because we certainly can understand some of the things that you all are saying, but I'm afraid that you won't understand the cultural impacts that I'll be discussing briefly here, and that's -- that's an adhesion process as I understand it.

First of all, consultation with the experience we have here on Standing Rock as a Tribal Government Official since 1991 is an exercise sometimes encrypted as fiduciary responsibility. And I'm sensing that tonight, that this is simply an exercise that will be labeled as a fiduciary responsibility because of the time limitations that

NA-1

2053 (cont'd)

are given to us.

Secondly, there's no guaranty as I see it that our comments will be implemented since tonight's hearing is not formally scheduled on the schedule that you put up on wall. There's nothing on there that says Fort Yates, North Dakota, with the date. NA-1

Certainly Oceti Sakowin membership in our homelands are not minorities designees. Rather, we do have a legal and constitutional relationship with the United States of America. And that isn't shown in any of the documentation that you present to us tonight. NA-3

I would also like to state that the positive impacts of our ceremonies that you simply allude to, you don't understand the full impacts, especially since the decolonization of American Indians peoples and America has been drastically impacted. You will never understand how important these ceremonies are. Rather, it's a set-up right now because the amount of money and effort that's put into this process and this exer -- what I call an exercise. NA-4

The impacts to our members of Oceti Sakowin and those members and friends such as educators, business interests, et cetera, et cetera, you will never be able to understand because, I say this

respectfully, it's your profession and it's your job and these are our homelands. So you'll never ever, ever, ever understand that.

Now, as one member of our Tribal Government, I must oppose this process until language, for one, exists to cease the flights mutually. There's nothing in here that I've heard or that I've skimmed over that we can say we need to cease these flights because we have ceremonies. We have things going on throughout our homelands. NA-5

The other important issue I have to bring up to you is that cultural sites are inadvertently discovered continuously and we must recover and protect these as significant. And those aren't articulated here. Rather, there's a skimming over Native American issues in the documents that you provided for us. CU-2

The reason I say these and have to speak in this fashion is because the experimental projects that have been done on our peoples as early as 1990 with the hepatitis trial vaccine project that was approved by the Federal Government. The trial vaccine project was approved. The vaccine wasn't. And that's essentially what I'm seeing here. The project is being approved and counted as such.

2053 (cont'd) Page 39

Of course, we all hopefully know about the infestation that our people suffered when blankets infested with germs were given to us. And as you articulate that these aren't going to harm anything or anybody, we won't know that until years down the road as we've known that years down the road with these other incidences. CM-3

So I have one question. I want to share as many other issues as I can. We'd like to know how often the Air Force and government or aircraft contracted by the Air Force and government drop fuels, contraband, and/or waste over our homelands of Oceti Sakowin. NA-6

Oceti Sakowin homelands as agreed to by treaty are the entire western half of South Dakota, parts of Wyoming, Montana, and Nebraska. That's our Oceti Sakowin homelands and that's what we like to refer to ourselves as.

So as you look at these documents, as we've been given a brief opportunity to look at them, again, please, for the record, this is simply an exercise. And you will call it fiduciary later on, but it's an exercise, a futility on our part, but we're still going to oppose this as a Tribal Government Official because of many, many reasons. GE-2

It's going to take longer than the prescribed time frames and limitations of this process that you articulated.

I need to say this in protection of our children, grandchildren, and those yet born.

So I hope I didn't use up my three minutes. Or did I? Your cue cards. But these things have to be said as I've been given an honor and responsibility to represent our people here at Standing Rock.

Thank you so much for coming. And again, I hope these are part of the record because we're not formally scheduled on the schedule that you presented to us. I know that can be a trickster in itself. Thank you so much.

HEARING OFFICER GREGORY: Well, I don't know about the formal schedule, but I can tell you that it's part of the record because here's the record. (Indicating) And if it weren't a formal hearing, I wouldn't be here.

MR. TAKEN ALIVE: Treaties are formal records. They're not followed. That's my point.

HEARING OFFICER GREGORY: Well, I can assure you tonight's is a formal hearing.

MR. TAKEN ALIVE: You said if there was going to be no debates. I need to respond to your

2053 (cont'd)

comment.

HEARING OFFICER GREGORY: I just want to clarify, it's a formal hearing.

MR. TAKEN ALIVE: In my view it isn't until it's formally put on the schedule, so...

HEARING OFFICER GREGORY: All right. And also I wanted to tell you, if we have time after everybody's had a chance, we'll get you more time.

MR. TAKEN ALIVE: Sure.

MR. IRONSHIELD: Colonel?

HEARING OFFICER GREGORY: Sir.

MR. IRONSHIELD: I wanted to ask you --

THE COURT REPORTER: Wait a minute.

HEARING OFFICER GREGORY: She can't get it down. If you want to speak, I'll get you one of those cards. Or if you want to chat with him.

MR. IRONSHIELD: Mine's already in there.

HEARING OFFICER GREGORY: Okay. Well, maybe I'm getting ready to call it out here.

Let's see. The next one I have is Ms. Phyllis Young. Phyllis Young. There you go, ma'am.

2054

MS. YOUNG: Thank you. They're all reminding me three minutes. I'm the wrong person to have a microphone and the longest-winded person in Standing Rock.

2054 (cont'd) Page 42

For the record, my name is Phyllis Young. I am the Hunkpapa and Ottawa Band of the Lakota Nation here on Standing Rock.

And I bring for the record the minutes of the Long Soldier Community meeting which was 120 people on September 22nd which opposes the use of the airspace, and also a record of two years ago October of 2008 that opposes the use of airspace. GE-2

One of the experiences early on in 1983 was my son was practicing the religious ritual of the Hanblecheyapi, or the vision quest, on the -- at Sitting Bull Camp when he was "buzzed" by the United States Air Force. And that was only a few years after the Indian Religious Freedom Act was passed by the United States Congress.

So when you have a young person in your family who is very, very sincere and devout about a right of passage and participating in religious practice, I was very offended, very offended. NA-4

For the record, I was raised on VA pension. I know about the first World War. My grandfather was in 1918 the first World War. My -- my uncles, my father were heroes at Normandy, 82nd Airborne. That's my history. That's my life. That's all part of my heritage, having been raised by the military

here. So I have a great respect and admiration and love for that history, and to have been raised in a good way until the United States took away our way of life in 1960, in 1958 by flooding the dams, by creating the dams.

So we were able to make it and live on that subsistence, have our own gardens, our own independence, and make a life for ourselves after the war.

And, you know, the war kind of -- my grandmother always said it makes you witko tko ke. That's kind of like crazy when you have to come back after you've suffered the perils and the experiences like what's happening in Iraq and Afghanistan today and all the social pathologies that are created by it.

So I think I lived my own history and I have always supported. And today I continue to support the military in my own way, in my own devout way. But I believe that there has to be a mutual respect, there has to be a mutual understanding, and there has to be a mutual benefit.

And so I think the United States has to honor our lives, where we live on our lands and the cultural resources that we have here. We're the

NA-7

heart of this nation. We are still pristine. We are still pure in our blood systems. And, granted, we have been tainted along the way in our survival, but I believe that our community has spoken here.

In 19 -- in 2008 there were 57 people in this community that voted against the use of airspace, and again on September 22nd there were 97 people of 120 people in this building the other day that voted against this because of the past experiences. GE-2

Our only experiences have been being "buzzed" in our religious practices by the military. And we were very devastated when the helicopter crashed at Bear Butte, but we said that the Great Mystery takes care of us in strange ways.

So that is the heart and spirit of my testimony, is that the use of this airspace by the military has interfered with the most sacred right of our people in our religious practice. NA-4

So for the record, I have a Resolution that was adopted by this community in 2008. It was reaffirmed the other evening. And I just want to read, not the entire Resolution, but I'll take a couple of paragraphs here.

"WHEREAS, the Standing Rock Sioux Tribe is in the process of developing measures for the

2054 (cont'd) Page 45

protection and use of the human environment and of the resources of such environment for airspace, air quality, water resources, the subsoil, the land, and land uses beyond the limits of natural jurisdiction in order to supplement Tribal resources available for the achievement of the economic and social progress and development of members of the Standing Rock Nation."

"WHEREAS, the Standing Rock Sioux Tribe and its membership desire to live in peace and freedom from the dangers of nuclear war, oppose any propaganda and preparations for war, to participate in the economic development of Tribal resources and to preserve a healthy environment for all living things."

"WHEREAS, the Standing Rock Tribal Council in 1986 and 1987 objected to and opposed the use of airspace over Standing Rock for the purpose of low-level flight training by the United States Air Force due to the interference (buzzing) with the religious practice of hanbleca, or vision quest, at Sitting Bull Camp by traditional Lakota and Dakota men, as guaranteed by the Indian Religious Freedom Act of 1978."

So for the record, I submit this Resolution. I

submit the minutes of this community, which is really the voice of our people, and would like to submit that for the record. Thank you.

HEARING OFFICER GREGORY: You can either give those to me for the record or one of our reps back there at the table.

MS. YOUNG: I will give it to you.

HEARING OFFICER GREGORY: All right. Thank you. And all of the written comments again become a part of the record.

All right. Next I have Mr. George Ironshield.

MR. IRONSHIELD: Sir, can I go last?

HEARING OFFICER GREGORY: Okay. Unless the other fellow wants to. Then I don't know.

Mr. Cedric Goodhouse, Sr. Mr. Goodhouse. Do you think he's in the building? Oh, good. There we go.

MR. GOODHOUSE, SR.: I forgot what I was going to say. Let me see here. 2055

From the time of our creation, it talks of, to shorten it up a little bit, it talks of where Eon Spirit went and created mahpiya to, blue sky. But from that, from that time on, there was no -- it was all still in one. But when that happened, there was the spirit went and created mahpiya to. So there

2055 (cont'd)

became a blue sky.

But that's one of the reasons that is paramount to why we need airspace. It's coming to the time where -- where we -- it's almost in a survival time because of the -- the encroachment on every -- every -- every aspect of our being. Not only -- not only us, but also you, you know.

So it's real important to understand the ceremony of hanbleca, you know, before you can understand what we mean by that.

NA-4

Tahunci Jay who was our Tribal Chairman at one time and we used to talk about these things because there was some real important language that when he talked to treaties, there's a part in our treaty that says, and I think it's Article 2 if I'm -- the Fort Laramie Treaty of 1868 where it says for absolute and undisturbed use and occupation. And it lies -- you're within those boundaries of what you're proposing, you know.

And that's -- that has been diminished. The interpretation has been diminished over time. And, you know, there's no -- you cannot hide the negative statistics that plague our people. And I look at all of it related to how our spiritual life has been -- has been taken away from us because of

NA-8

people just do not understand. And I seen how all the people that have come to this part of the world, it's coming full circle now. Now they're wondering how to prevent more people from coming, you know. But, you know, but -- but, you know, the people that have come here and are here now live in this concept of if you're not understood, you're not accepted. But the reason why we're here the way we are here today is because we've accepted so we can better understand, you know.

And I want you to, if anything, to take that with you. Because you really need to understand us so you can see where beyond, you know, what you're doing as you are affecting human, human beings. And this is what -- you know, why -- why we have these treaties, why these laws have been passed, you know.

In '78 they all said, "Oh, my God," you know, "Let's give these guys their religion back," you know. What do you mean? We're not part of the Constitution? You know.

So you have to really understand that, you know. You can't just go through these motions because this is what you're supposed to do according to NEPA, you know. You can't do that because where we are in the survival mode.

2055 (cont'd) Page 49

Because I see our people, it's like our social fabric is kinda -- kinda becoming unraveled here in these last few generations. So it's real serious when we talk of the need to have our spirituality considered in this, in these things.

NA-4

So I just want to say about that much. So thank you.

HEARING OFFICER GREGORY: All right. Thanks, sir.

Do you still want to go last? Because I've got one more.

MR. IRONSHIELD: Am I the last one?

HEARING OFFICER GREGORY: I've got one more in front of you now. Okay. Mr. Ironshield. There you go.

2056

MR. IRONSHIELD: Colonel, I'm an Air Force reject. I was in Air Traffic Control. I was going to school in Biloxi, Mississippi, Keesler Air Force Base, and I was in weapons. And being a bookworm, I always carried a good book because everybody was standing there smoking their cigars or cigarettes or whatever, shooting the bull, there I'm sitting on my feet reading my books. I always like to read.

But anyway, I don't want to talk about all the bad stuff that happened. But I ran into a Sergeant,

a Staff Sergeant there, and he was one of our weapons instructors, and anyway, he got me discharged because I had unclassified material in my class. So they couldn't give me nothing other than an honorable discharge because I was also a student leader, a squad leader, and at that time they had red ropes for squad leaders and yellow ropes for the next guy up, and the white rope was the only one on three squads. But I was training for that white one when I got my -- got in trouble.

But not to explain my -- where I'm at with it. It's not what I did. They changed the dates, see, on that. In '61 so I'm in the Vietnam Era, but I never went to Vietnam. But maybe it was good. If I did finish my schooling, maybe I would have been dropping bombs on our guys, you know, because they're whites.

So anyway, maybe it was good they kicked me out. But they said I had a schizophrenic because when we're marching in review, I hear these voices in the sky calling my name in Indian. And when I turn and look, I get gigged.

But other than that, when I got discharged I went home. My uncle woke me up and said, "Come on. Let's go march." I said, "Ah, you see that paper

2056 (cont'd) Page 51

hanging on the wall? It says honorable discharge." He said, "You spend one day in the military, you're a soldier," he said. "And our comrades are falling like flies." He said, "We gotta take care of them."

And so from that time on we've been marching, learning how to march, learning how to do funerals. And I'm still doing it up to this day. I'm still burying our deceased comrades.

In fact, it is surprising, last winter they honored us with, from the National Defense, a little flag, a little pin, hat pin they gave us. So I'm still going there. I'm still going back and doing our prehistoric burials. And somehow -- I've been re-burying our ancestors that have been uncovered by this river that the Army built and I've been taking care of our ancestors. And somehow they gave me the gift to be able to find burials.

So I worked with a lot of these wind towers. I've been to cell towers all the way in the Black Hills. I've also fell off a mountain and I got arthritis in both hips. I don't march so good any more, but I got -- also in the small of my back I got arthritis. But I don't take pills, okay?

But now the thing I was wanting to talk about, in Pine Ridge, that bombing range that they had

there, there's a lot of bombs that have not been picked up. When are they going to ever clean those, those bombs? When are they going to pick them up? Because they've been asking us to go down because that's also a burial area for our ancestors. So we need to go down there and take care of our ancestors, yet these bombs are there. And I don't feel like getting blown up in this late date, you know.

NA-7

And so anyway, that's what I was asking my grandson, if he could make a comment and ask if you guys are going to do anything about that.

And I've been to one of these before in Rapid City, and I told them about the chaffing, what that does to the land and the air we breathe and all that kind of stuff that they're going to use real -- like back in World War II I think they used it to put snowflakes on their radar screens. And in Korea, there are all those Air Bases are overrun because the airmen didn't even know how to load their M1 cartridge. We had to qualify on the M1 cartridge. I shot expert, but they won't let me wear a wreath around my M1 cartridge like they do in the Army. So anyway, that's what I shot at Lackland in Basics. So all I fired was a .22 and a 12-gauge

SA-14

2056 (cont'd)

in that time.

But now I work -- I'm 70 years old and I retired five years ago, but the Tribes still haven't found a replacement for me to help with our Tribal Preservation Office. So here I am still out in the field doing that; walk about. And still hurt. I fell down a mountain last year where my grandson was at.

But anyway, I don't want to cause any troubles or hurt or anything, but we need to work together. And also in our spiritual life, I'm also a spiritual healer, a ghost healer. And my ancestry comes from bear from Pine Ridge so I use bear medicine pretty successfully, so... And I don't just heal Indians, okay. Even animals.

So not to cause any harm or anything, but it's good to see you fellows in your blues. I got discharged in July so we had suntans and short sleeves and everything. We looked like hell, you know. Looked like -- I better not say. But you sure look good in those blues.

HEARING OFFICER GREGORY: All right.

MR. IRONSHIELD: Thank you, sir.

HEARING OFFICER GREGORY: Thank you, sir. Thank you.

I hope I get this right. Ms. Petra Reyna? Is that right?

MS. REYNA: Yes. My name is Petra Reyna. 2057

Hau Mitakiyapi! I'm a Tribal member here and also a teacher in the high school and a mother. I came because I saw the announcement when I was walking through the store, and walked in and then found out we had three minutes to say something, which to me was, three minutes. And then as I'm reading because I don't know anything about the EIS or whatever, well, where's the Draft EIS? So I go over there and it's that big ole book. Well, I don't have time to read it tonight and then make my comments and let alone make comments in three minutes in reference to that Draft EIS. I mean, I need a couple weeks to look through that Draft EIS. NP-5

I just returned -- I don't like the way this sounds. But I also sit on the committee that is involved with our language revitalization and we just visited the people in -- the Hawaiian people and we had lunch with them, and one of the issues they talked about was the observatories, the bumps that are on their sacred mountain and the disruptions that they believe are occurring to their people.

2057 (cont'd) Page 55

And we need to start that for our people. We need to start that revitalization and that's what we're trying to do. We're trying to revitalize our language and our culture. And we have enough negativity going on in Indian Country.

And we just want to be at peace, you know. We just want to be in peace so that we can rebuild our nation; so that we can teach our children to be the Lakotas we are because Lakotas means allies. So we're not that stereotypical fighting Indian that we're depicted in the pictures.

NA-7

Just in listening to the presentation, there were some concerns that I had that, you know, for me were red flags. One being silicon would be released into the air. Well, asbestos -- silicon, yes, occurs in nature, and asbestos when it's in the buildings, it's okay to come into the buildings, but once you disrupt that asbestos and those asbestos particles are released into the air and they get into your lungs, your lungs can't get them out. And it's the same way with silicon.

Yes, silicon occurs in nature and is found in nature, but once it's disbursed into the air and gets into your lungs, your body can't get rid of it. Your lungs can't get rid of it. There's -- we have

SA-14

Powder River - Ft. Yates 9/27/2010

2057 (cont'd) Page 56

enough health issues.

The other thing was migration patterns. Yes, they're addressed, but what other birds. You know, eagles are sacred to us. You know, there's just tons of birds that already are having trouble. Their migration patterns have been destroyed. And we just have so much environmental issues going on already.

You talk about if the buildings are sound enough, they're not going to be affected. Well, in Indian Country we don't have the infrastructure as it is. We don't have quality buildings as it is. So yes, we're going to have houses blown over because they are made of sticks.

And the last thing was -- thinking about, you know, I was thinking about those Hawaiians and their sacred mountain, that's the same thing with the Black Hills. The Black Hills are sacred to us and they're our site of creation. We came here, no matter what anybody else says, our creation stories tell us that we've been here from time immemorial, and those sacred sites are always -- there's always an issue going on.

You know, we have to deal with Sturgis and taking my sons through Sturgis so we can climb up

SA-14

BI-6

SO-18

CU-2

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

Bear Butte and, gee, there's pictures of half-naked women all over, you know, and trying to talk to my sons about having discipline, and yet we're in our sacred sites and having to deal with that on the eye level.

And then the backing formation that's being assessed up north, you know, that's underground. Nobody's addressing those issues, but that's going to affect everything underneath, underneath the earth.

When we presented ourselves to the Hawaiians, they asked us to speak in our language and to sing a song because that's what they did for us. And when we sang our song, the song we picked was the "Four Directions." So we still sing to the four winds. We sing to the four directions. And that's what's going to be disturbed up there, up in the air. You know, we sing to the creator and that's going to be disrupted. And we sing to Mother Earth, and she's already under attack everywhere.

So those were some of the -- kind of the red -- the red flags that raised up for me. And I'm sure there's plenty more because I need a couple weeks to read through the Draft EIS. So thank you.

HEARING OFFICER GREGORY: Okay. Thank you,

2057 (cont'd) Page 58

ma'am. And as I mentioned earlier, this certainly isn't the last time to make comments on this. You can take a look at that draft and if you want to submit written comments, you have until November the 15th to put together some written comments and send them to the address that's on that brochure and the comment sheets. So take your time, go through it, and please add to your comments if you'd like to.

Next I have Mr. Jeff McLaughlin.

2058

MR. MCLAUGHLIN: Good evening. My name is Jeff McLaughlin and I'm from McLaughlin. That's a family history name in history. But I wanted to in the three timing -- the three minutes isn't sufficient time for me to explain that -- I guess listen to these fellow Tribal members, that I guess they are opposed to that, and I'm opposed to that also, the no-fly zone. Because we're dealing with the land and water issues. GE-2

And I work with the elderlies of the Hunkpapa Treaty Council. And most of them are gone now and so I guess, like I say, no -- well, I am saying no, but what are the mitigating factors? Because for example down at the Denver Broncos game last year, they had a fly-over, played the National Anthem, but that 500 feet or less and that's -- we don't want

those jets flying around your house, the tail wind or whatever, the sound is -- that's 10 days out of the year, but...

Anyway, there's a lot of reasons, but I wanted to just on this map here, colored map, our treaty boundaries go way into the Powder River country and so now, you know, it's troublesome because there's -- only a handful of us are here and I guess we're being -- what do you say? -- singled out now, but -- because the information that we know, that we learned, is not taught in schools and there should be -- this room should be filled up or we should have it at the Pavilion to talk about this issue. But people are telling me, people that can't afford the gas and get up here and to voice their concern because -- for whatever reason, you know, they have -- maybe they're a veteran with PTSD and that will be -- you know, to see B-52 bombers flying overhead, you know, that's -- that's traumatic right there.

And -- but getting back to military, I guess I'm saying no, but the military is going to say yes anyway. What are the mitigating factors. Because this 1889 (sic) Act, that's illegal. And where is the military act now to put -- to move these

NA-8

non-Indians out because there was not three-quarters consent. NA-8

And Article 2, the Bad Man Clause, there's 17 articles in that 1868 Treaty, and where is the military act to help protect our rights, our land base, cultural identity.

I expect great racism even though my name is McLaughlin from both sides, you know, racism from non-Indians and Indians alike.

But anyway, where is the military act to help us in this, to keep our lands for undisturbed use. NA-7

And so anyhow, I think that is pretty much what I wanted to say. Is that two minutes or something? But thank you.

HEARING OFFICER GREGORY: All right. Thank you, sir. Is there anybody else who hasn't spoken yet who would like to? Anyone? Okay. We still have some time. So as I mentioned at the beginning, if we've heard from everyone who has signed up to speak and have time left, I'll offer more time. Would anyone who's already spoken like more time?

Mr. Taken Alive, would you like another three minutes back on the clock? Give Mr. Taken Alive another three minutes. There you go, sir.

MR. TAKEN ALIVE: Thank you very much for that

additional three minutes. It's reminiscent of times when you go to Congress and they give you five minutes.

So one thing I'll share with you before I make comments about the -- follow-up comments is that in this part of the woods, as they say in your language, we want to continue to be human beings and not human doings. So that's critical to not be human doings just for the sake of money.

There's been mention this evening of treaties. Treaties are still on the books. Just because the United States didn't -- hasn't upheld them doesn't mean they're not on the books. And I think that it's imperative that we continue to articulate those. The United States Supreme Court said that they could be and should be interpreted by said Indians, and so that's what we're doing tonight. NA-8

And the language is so simple. Article 1 of the 1868 Treaty that's been ratified by the United States Congress, the treaty that puts our law of the land. And treaties come from the Constitution of the United States of America which predates of course treaties.

Sometimes when we say treaties, a lot of people think that they're dead documents and shouldn't be

re-visited any more, but in our view they aren't. They're alive and well.

Article 1 begins by saying, of the 1868 Treaty, "From this day forward all war between the parties to this agreement shall forever cease. The government of the United States desires peace, and its honor is hereby pledged to keep it. The Indians desire peace, and they pledge their honor to maintain it.

If bad men among the whites, or among other people subject to the authority of the United States, shall commit any wrong upon the person or property of the Indians, the United States will, upon proof made to the agent, and forwarded to the Commissioner of Indian Affairs at Washington city, proceed at once to cause the offender to be arrested and punished according to the laws of the United States, and also reimburse the injured person for the loss sustained."

And we know as we look back in history there's been a lot of wrongdoings to Native Americans. Just look at our health situation, Indian Health Service, et cetera.

Article 2 as was alluded to earlier describes the Great Sioux Nation, Oceti Sakowin. As I said

earlier, it's the entire western half of South Dakota, going west starting from the east bank of the Missouri River up into North Dakota, Wyoming, Montana, and Nebraska. And once it's described formally in Article 2, it goes on to say, "set apart for the absolute and undisturbed use and occupation of the Indians herein named, and for such other friendly Tribes or individual Indians as from time to time they may be willing, with the consent of the United States, to admit amongst them..."

So this is what absolute and undisturbed use. I think, if anything, that should show up in our record that we're sharing with you tonight.

I know you shake your head, but you don't understand. But I thank you for acknowledging hearing me read this. And that's a huge concern I have with my friends here that come to the reservation. You don't understand this. But I continue to welcome you to our reservation.

So again, for the listeners out at KLND, this is very serious. We're talking about rights over our homelands, over Standing Rock, on the western half of South Dakota, and the potential for continued interruption and disturbance by the United States of America from the Air Force. And again,

NA-8

NA-8

I'm saying this because the treaty says that these lands are for our absolute and undisturbed use.

So thank you so much again for coming. I need to continue to defend our people and our rights, and there are many. So we'll look forward to working with you and we'll look forward to seeing this plan, I believe it's option 4, where we oppose it tonight. Thank you.

HEARING OFFICER GREGORY: Thank you. And, sir, if you want to make again any of that as part of the written record, all you have to do is just leave it here or leave it with one of the representatives in the back.

MR. TAKEN ALIVE: You can probably get a copy of this in the United States Congress.

HEARING OFFICER GREGORY: I know we can, but I saw you had a lot of documents.

MR. TAKEN ALIVE: These are your documents. The treaty-making process is one of the United States of America, and it's the same as -- these are just copies. I'll give you a copy nevertheless, sir. It will be the same as what you got back in D.C. Thanks.

HEARING OFFICER GREGORY: Okay. I just wanted to give you a chance to do that. So I'll take that

as a written addition.

Anybody else? Yes, ma'am. 2054 (part II)

MS. YOUNG: I would like to read this. This is Phyllis Young. For the record, I would just like to read the Resolution.

"WHEREAS, the Standing Rock Nation has a relationship with the United States of America that has a legal status far beyond and above any relationship with any entity, state, or corporation and for this reason, Standing Rock has prior and paramount rights to the airspace above the lands of Standing Rock, including the airspace in infinity; and the primary status of those rights stems from the 1868 Treaty of Fort Laramie, the legal principle which provides protection relative to the sacred asset: airspace."

"WHEREAS, the United States of America has the responsibility of adopting measures prohibiting the pollution and damage to the social progress and general welfare of the members of the Standing Rock Nation and this responsibility cannot be delegated, denigrated or abrogated."

"WHEREAS, the Fifth Amendment of the United States Constitution provides for 'just compensation' to property owners for any losses and this right

includes members of the Standing Rock Sioux Tribe as determined by the treaties and continuing rights derived from the treaties."

"WHEREAS, the Standing Rock Sioux Tribe is fully recognized by the United States of America pursuant to the Treaties of 1851 and April 29, 1868 at Fort Laramie and it is elemental that the rights to the use of airspace reserved by the Standing Rock Sioux Tribe arise not from a grant by the United States to the Tribe but, rather, the Tribe reserved those rights to the use of airspace when the Treaty was signed with the United States."

GE-7

"WHEREAS, damages to the people of the Standing Rock Nation have not been determined, which includes damages to cultural resources, resulting from 'buzzing' or interfering with religious practices as well as overall social cost damages resulting from electromagnetic fields created by flight paths; and impacts on all living beings; and it is the wishes of the people of Standing Rock Nation that these damages be estimated, mitigated and compensated immediately."

"NOW THEREFORE BE IT RESOLVED, that the Standing Rock Sioux Tribe oppose the use of its airspace for any purpose until the United States Air

Force submits a Plan for not polluting the Air (by electromagnetic fields or otherwise) and negotiate a dollar amount, depending on the scale of the project, which would allow the Tribe to make an independent assessment on Tribal Air Quality and Interference on Religious Practices, including 'hanbleca.'"

"BE IT FURTHER RESOLVED, that the Standing Rock Sioux Tribe negotiate a fee for the use of airspace that might pollute the air (by electromagnetic fields or other pollutants) so that the Tribe can evaluate independently an assessment from how much pollution results from the use of the airspace."

"BE IT FURTHER RESOLVED, that the Standing Rock Sioux Tribe demand that the United States of America administer the rights derived from the Fort Laramie Treaty of April 29, 1868, by the establishment of a Commission that will address provisions necessary for rendering effective standards and regulations applicable to the use and withdrawal of airspace; 2) Provide compensation for use, damages, be they social or economic in nature, including restitution and reparations, caused as a result of aggression and of illegal occupation of boundaries claimed by Lakota/Dakota people; 3) Achieve total disarmament

and utilize resources to be used only for the economic and social progress and general welfare of the members of Standing Rock Nation." For example, wind power development. "4) Adoption of measures prohibiting the tests of space weapons, the development, production and buildup of space weapons for the preparation of war, and the pollution and damage to the members, the land, water and air of the Standing Rock Sioux Tribe."

I wanted to read that for the record. I also would like to touch on the cultural interpretations of what the greater society refers to as Mother Nature. Things are happening all around us in this universe and it's incumbent upon we as the keepers of this earth to try to help heal Mother Earth because she is trying to heal herself by the floods.

In our culture, we have our greatest powers that we believe in and the Great Spirit we refer to are the winds, the rain, the clouds. In our language, those are all the greatest beings of the universe. And no one, no human, no living thing, can overcome the natural world.

And so the wind as we speak in this case specifically is the mischievous one of those powers and she always wants to play. And so as a playmate,

NA-7

she is mischievous. So if you interpret that, you will see what powers she has when she plays. And in your world, you refer to it as a tornado or hurricane or something negative. And when that happens to us, when she comes here, we offer her tobacco. We welcome them when they come. When it rains, when it snows, when it hails, it's a purification process.

So we have a totally different interpretation of the atmosphere of the universe and our belief systems are very, very different. Well, where a rainy day for you is a negative, it's a beautiful day for us.

So as the earth is being purified, we ask that you not interfere any more. We feel that our nation has given greatly to the national interest. We have given our land, our water, our resources. Maybe not in the mutual benefit, but we have given in the national interest. And we ask that you respect us and a mutual understanding that we are pleading with you to grant our wishes that there be no more interference in our lifestyle in our own homeland. Thank you.

NA-7

HEARING OFFICER GREGORY: All right. Thank you, ma'am. Anyone else?

Well, I'll tell you, if you change your mind, all you have to do is let me know. But since we've got a little bit of time left and we've still got all the representatives here, at this time I'll go ahead and thank you for coming out tonight and inviting us here and showing your interest in this Powder River proposal.

As I've mentioned several times, I'll mention once again, tonight's not the end of your opportunity to participate in this process. Again, written comment sheets are available at the registration table. You can turn these sheets in tonight or mail or fax them later. The mailing address is printed on the brochure and the comment sheets.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process, but again, to receive timely consideration for the Final EIS, please have your comments submitted by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter with a postcard asking for your own copy and the Air Force will send copies of the Final EIS to you.

There being no more speakers at this time and it's still before 8 o'clock, I'll go ahead and recess the hearing. The Air Force reps and FAA reps will be available back by the displays. You can speak with them about anything you'd like to. And if you change your mind about making a public comment, all you have to do is come up here and let me know and I'll turn the tapes back on at any time before 8 o'clock which is about, oh, 20 plus minutes from now.

So at this time I'm going to go ahead and recess the hearing.

(Hearing in recess at 7:40 p.m.)

HEARING OFFICER GREGORY: Well, we're back in session. There being no more speakers and it's 8:00 p.m., this hearing is now adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the forgoing Pages 1 through 71 are a true and correct transcription of my stenographic notes.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

earlier, this formal part isn't a Q and A session. It's an opportunity for you to put your views and your concerns about the proposal that you want the decision-makers to consider. Questions that you pose during your comments will become part of the record and will be considered. And of course after we're done, as I mentioned earlier, when we're done with the formal part of this, the FAA and the Air Force reps will continue to be available outside by all those boards to continue discussions with you.

And with that, I'll move to the first speaker that I have on these cards up here. I'm going to move this thing out so it's more convenient for you and move the mike out. Careful not to unplug it. There we go.

All right. I'll just deal off the top here. Let's see. Mr. Bob Simmers of the Bismarck Aero Center. Sir. All set.

2059

MR. SIMMERS: Colonel, Major, Ms. DeVine. I'm Bob Simmers, that's S-I-M-M-E-R-S, and I'm the co-owner and operator of the Bismarck Aero Center at Bismarck Airport.

Our FTO services a majority or a lot of the airplanes in the area and our basic service is ground support. One of my concerns with losing any

50-10

2059 (cont'd) Page 34

kind of airspace is, about 30 percent of our fuel sales at this airport comes from transient traffic; somewheres in excess of 3 million gallons a year. If we lose 30 percent of that, it's devastating to our business. SO-10

And I might add that, you know, this -- this has been labeled an Environmental Impact Statement, but it doesn't say much about an economic impact. SO-22

And most of this stuff I'm going to talk about is an economic impact to us because we all survive on the money that's generated here.

The aviation community is a small community and it's a tightknit community and, you know, we're -- it's tough to make a profit in this business, and so it's important that we explore all avenues to generate as much revenue as we can. So that's one of the services that we provide.

The next service that we provide is, we've been involved with the transportation of medical teams from the Bismarck area to satellite communities like Hettinger, Bowman, and other areas of the state. But in this specific case of the Powder River MOA, this is a concern to us. The concern stems from the fact that there are probably in excess of 80 medical flights a month that depart the Bismarck Airport and SO-5

go to these satellite communities. That's, you know, in excess of three a day on the average.

They go into these areas. They fly IFR in there. And these teams, a lot of these teams have the potential to make between twelve and $1500 an hour. That's what they're worth. And they go out there. They fly because they can't afford to drive these teams out there and have them behind the windshield for that amount of time so they fly them out.

SO-5

Under this proposal, it limits, you know, not only the access to these communities and the services that they provide to these communities, but a bigger deterrent probably is the fact that they get there, they do their job, and when it's time to come home, all of a sudden the MOA became hot and now they're grounded because the weather has gone down or they choose not to fly in VFR conditions. So it's a, you know, it's a bad deal for them.

AM-12

You address the life-guard flights, and we understand the -- you know, their -- you know, that you're going to give them priority in this situation, so... The dispute I have on the findings on the life-guard flight is the 496-page document, or whatever it is, the section in there that says

SA-18

Powder River - Bismarck 9/28/2010

2059 (cont'd) Page 36

that most of those life-guard flights are below 10,000 feet. Well, today I'm here to tell you that most of the life-guard flights fly above 10,000 feet because they're all taking pressurized capsules and they're making longer trips and they're using higher performance airplanes and they're flying at higher altitudes for whatever reason: patient comfort, weather, you know, any of the environmental issues that they may -- that they may be faced with, why, the pressurized aircraft is the way to go.

SA-18

Another industry that's booming in our area is the oil industry, and we see just a tremendous amount of traffic that comes in from the south and flies into these areas. If they get -- if -- with this development, if this is -- becomes a deterrent to them, why, you know, they're not gonna -- they're going to find other ways of getting their work done. The aviation community is going to lose out.

SO-17

Charter is restricted to flying in controlled airspace, into areas where they have weather. And now -- you know, it used to not be such an issue, but the more advanced we get with everything, the more accessible all these small communities are to charter aircraft. And so, again, putting up -- taking the airspace away from the general public is

SO-5

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2059 (cont'd) Page 37

going to put them in a bind getting in and out of there and being able to do the job that they've been asked to do. SO-5

One other thing that I'm involved with, I might say -- might mention that I'm a pilot with over 15,000 hours. I've been flying for almost 50 years. I spent a lot of time with aerial application. And again, this was addressed briefly in this document, but the environmental impact of this has not been researched at all. And, you know, it's -- aerial application is -- and the application of pesticides is extremely critical and time sensitive, and any delay whatsoever causes great economic hardship to the agricultural community. SO-2

And while I was researching some of that stuff, one of the things I found -- obviously I didn't get to read the whole document word-for-word, but on one of the documents that I found they were talking about agricultural, it was data for the counties that were involved there, and the figures are so out of place on this sheet of paper and, for whatever reason, somebody -- it's obvious that somebody didn't proof this because, for instance, they say that Montana has 61,000 acres -- 61 million acres underneath this -- underneath the proposed MOA. SO-30

2059 (cont'd) Page 38

North Dakota has 626,000 acres under this -- on this sheet of paper that came right out of -- it's actually Page 153 in your -- in the document. But still one of the counties in North Dakota has over a million acres. Well, it doesn't add up. And if this is representative of the rest of the document, you know, there needs to be a lot of work done on it. SO-30

One of the other things that I printed out was a copy of the -- of the low-level -- or of the air traffic that had been -- that had been mapped through the area. And this one has -- talks about map traffic below 4,000 feet. Well, we all know that out in that area there is no radar that's capable of tracking anybody below -- most -- you know, between five and 8,000 feet. So I take issue with the -- with the information that's provided in this thing. SA-1

I'm also a technically advanced aviation -- or advanced aviation instructor for the new avionics that are -- that are placed out here. And Victor Airways, they talk about Victor Airways and making the corridors, but the intent of the FAA, along with NASA, is to create a system in aviation that's point-to-point aviation; where Victor Airways are AM-16

2059 (cont'd) Page 39

AM-16

going to be a thing of the past. We won't be flying Victor Airways. In fact, very seldom do we fly Victor Airways today. So I find that information, you know, totally outdated. With the new aviation stuff, why, it's -- it's -- we're -- you know, everything's point-to-point and it's all done with a computer inside the airplane.

So anyway, those are a few of the comments I have. And thank you for your time, and thanks for coming to at least greet us.

HEARING OFFICER GREGORY: All right. Next I have Mr. Darrel Pittman from -- I think it's NDAC, EAA, NDPA, and CAP. And I'll let you tell us what all that is. Folks may want to know.

AN AUDIENCE MEMBER: Does that count toward his three minutes?

HEARING OFFICER GREGORY: We probably shouldn't count all that as part of his three minutes.

2060

MR. PITTMAN: Thank you, Colonel. All those little letters mean all the groups that I belong to, so...

With that, I'd like to preface just a little bit, I am a veteran and I'm certainly not opposed to the military getting their training done. Been there, done that. But I'm also a retired Air

2060 (cont'd) Page 40

Traffic Controller and I've worked Powder River airspace.

It's -- it's a concern to me, it's always been a concern to me, when airspace is scheduled for usage. It's never done real-time. It has never been done. It's still not being done.

So my question is to the Air Force, what privileges are being provided to make the airspace usage for real-time uses for their needs. If you can call the Flight Service Station now when you're ready to take off and you ask them, "Hey, is Powder River hot?" the answer is probably yes. But you get up in the air and you talk to air traffic controllers and they'll say, "Well, we didn't want to go through there because it's not in use -- it's in use." And they're saying, "Well, no. There's no airplanes in there. It's not in use."

So we need to have some real-time scheduling for this for real-time usage so that the pilots can be aware of what's being used. I think it's extremely important.

I mediated a session between the FAA and the Air Force a number of years ago, I won't say how many, between -- about just this thing, about usage of airspace, and that same topic came up and it

AM-12

AM-12

never did get cured. We still have the same problem today.

You can call Flight Service and it will say it's in use. Yeah, it's scheduled in use, but is it really being used? That's the key.

AM-12

The other thing I have a little concern about is the proximity of the airspace to major terminals. Bismarck -- well, I live here and I fly out of here and it is a concern to me that, you know, there's only 30, 35 miles of space before a flight can get started down to land in Bismarck. As an old air traffic controller -- I thought I'd freshen up, Fred, so... Anyway, you know, 35 mile, you can't get an airline down in 35 miles, in order to safely get him down and get him on the ground so that he can keep his passengers comfortable and everything, so...

AM-5

And I spell my last name Pittman, P-I-T-T-M-A-N.

HEARING OFFICER GREGORY: All right. Thanks, sir.

MR. PITTMAN: Thank you.

HEARING OFFICER GREGORY: Next I have Mr. Bob Miller, North Dakota Aero Comm.

MR. MILLER: Colonel, I'd like to defer for a

2060 (cont'd) Page 42

little bit. You have a representative from the Governor's office here this evening.

HEARING OFFICER GREGORY: I do. Where is she?

MR. MILLER: Do you know what the Governor would like to see here?

HEARING OFFICER GREGORY: I don't think she's going to -- she's not signed up.

MS. TRAVNICEK: I'm not signed up at this time. We're here to kind of get everybody's input.

MR. MILLER: I'm going to pass for now.

HEARING OFFICER GREGORY: All right. Well, let me know if you change your mind.

Mr. Phil Mastrangelo. And they even did it phonetically for me. I'm sorry.

MR. MASTRANGELO: Not a problem. Thank you.

HEARING OFFICER GREGORY: There you go.

2061

MR. MASTRANGELO: I'm Phil Mastrangelo, M-A-S-T-R-A-N-G-E-L-O, and I'm the State Director of the U.S. Department of Agriculture's Wildlife Services Program and my office is located here in Bismarck.

Wildlife Services assists a number of entities with the mitigation of wildlife conflicts, and one of our larger programs in North Dakota is addressing coyote predations to livestock. And we use a

SO-15

multiple of tools to address these problems, including the use of a Hyper Super Club Cub which is an aircraft that we typically fly beginning at sunrise to mid-morning to early afternoon Mondays through Fridays.

SO-15

The concerns that I have with the proposed expansion of the training flights are unexpected encounters between military aircraft and our slow, low-flying Hyper Super Club Cub. These encounters could be direct encounters or indirect encounters with the vortices generated by these fast-flying military aircraft.

SA-7

I certainly recognize the need for military training and support that. However, training should not create unsafe flying conditions for non-military aircraft.

Thank you for allowing me to provide comments.

HEARING OFFICER GREGORY: Sure. Mr. Fred Adams.

MR. ADAMS: Thank you. That is spelled A-D-A-M-S.

2062

I'm Fred Adams, Chief Pilot/Travel Supervisor for Basin Electric Power Cooperative. Basin Electric is a regional wholesale electric generation and transmission cooperative serving more than 120

Powder River - Bismarck 9/28/2010

2062 (cont'd) Page 44

members, 2.6 million consumers, 9 states, and we cover more than 430,000 square miles based here in Bismarck.

Basin Electric is strongly against any increase in the size of the existing Powder River MOA or ATCAA. Basin Electric recommends the No-Action Alternative. Basin Electric believes the No-Action Alternative is the most responsible choice for the following reasons: GE-2

Adverse Financial Impact: Basin Electric is constructing a $1.4 billion electric generation plant 6 miles northeast of Gillette, Wyoming. Construction will be completed in 2011 and operations are planned for a minimum of 50 years.

The facility requires air transportation of employees and consultants from our headquarters in Bismarck to the Gillette Airport several times each week.

Currently, the Powder River MOA and ATCAA already have a negative impact on our flight operations, and the proposed enlargement to the PRTC will have even a more negative impact.

Over the last three years, Basin Electric has flown 1,791 flights into part of the proposed Powder River Training Complex. Over the last three years,

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

we've flown 316 trips annually between Bismarck and Gillette alone, and our direct operating cost this year is $442,242.

If Basin Electric has to avoid the complete PRTC, that annual expense would go up to $596,292. Additional costs to avoid the airspace is $154,050 annually, or about $490 per flight hour.

If I use the average additional expense for the other 281 flights that Basin Electric goes through all or part of the proposed PRTC, it would have an additional negative cost of $136,988, giving a total adverse operating expense of $291,038. This does not include employees' loss of production time or salaries. SO-7

Five safety factors I also think are in play here: The 30 miles from PR-4 to Bismarck is inadequate. You look at most factory descent profiles require between 33 and 43 miles to get down from 17,000 feet into Bismarck. If the high MOA is active, it's hard to comply with those. And if any of the ATCAAs are in affect, the problem gets worse and safe operations are compromised. A 60 nautical mile radius for IFR airports to the edge of the PRTC would then allow normal and safe operations. AM-5

2) There needs to be communication coverage for AM-3

all aircraft in the PRTC at all altitudes to control, deconflict, and cover other non-standard ops.

There needs to be ATC radar coverage for all aircraft inside the PRTC within the low and high MOA for FAA to control and monitor all aircraft. AM-3

4) The FAA center boundaries need to be modified so one center controls the whole operation. Right now, there's three centers and they can't deal with it in real-time with the standard airplanes. There's no way they can do it with high-altitude fast-movers. AM-1

And last, real-time data on the status of the PRTC needs to be available for everyone to see. No change should be allowed within 36 hours except for cancellations.

Basin Electric again is strongly against the proposed PRTC complex and recommends the No-Action Alternative. Thank you for your time. GE-2

HEARING OFFICER GREGORY: And, sir, I noticed you had kind of a bullet paper there. Again, if you'd like to submit that as a written comment to supplement --

MR. ADAMS: Oh, I already sent three pages in and I'll have another one there.

HEARING OFFICER GREGORY: All right. I just want to make sure you got them in.

MR. ADAMS: Which adds in to the '08 comments.

HEARING OFFICER GREGORY: All right. Gary Larson. Mr. Gary Larson.

MR. LARSON: Thank you. L-A-R-S-O-N. 2063

My comments on this is, I do low-level work. I'm with Phil Mastrangelo with USDA Wildlife Services. And all our flying is normally around the 100-foot level and we will climb to two to 300 feet. Cross-country we will be 500 feet and above. We do a lot of our work in the southwest part of the state.

And my concerns are with the vortices with the aircraft that we will encounter. Somewhere along the line, it's going to happen. And my problem is that I'm low and slow. So I'm dirty. I've got my flaps on flying low. And with the vortices, whether I'm going to have an effect with that, time to recover in the time frame needed at that altitude, which probably isn't going to happen off these bigger aircraft. SA-7

Another thing was the flight schedules. Their flights are early morning, late evenings, exactly the same as mine. All I do is early morning flights

Powder River - Bismarck 9/28/2010

2063 (cont'd) Page 48

and late evening flights. So we're gonna cross paths and that's going to be a concern. SA-7

Our number one goal is safety, both with the military and ourselves, but we gotta try to find a good correlation between each other somehow or another to make things work.

We fly with our windows open, so I have a concern with the debris from the flares and the chaff, whether our intake as individuals, if we have a concern with any of this. Because we're gonna -- like I say, somewhere along the line we're gonna be breathing this stuff. It's just a matter of when. SA-14

You're talking about charting and avoiding objects that are put up at 200 feet or above. Well, we will be a movable 200-foot object constantly, and how are we going to charter and control the avoidance between the two of us? SA-1

Normally what's going to happen is that if other aircraft come into the area where we're working, we will have to leave the area if the aircraft is going to be there for any length of time. Our policy will not let us stay there and do our work. So I'm afraid we're going to -- a lot of our cooperators are going to lose out on our workload for them with the situation that's before SO-5

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

us.

SO-5

And the communications for us, to be able to contact anybody at that level, whether it's Flight Service or anybody else, it isn't gonna happen at the levels that we work. It's -- I don't know how it's gonna work. But we are -- we are going to be on the back burner on that.

AM-3

And I think that's about it. Thanks for the opportunity.

HEARING OFFICER GREGORY: All right. Thanks, sir.

Next I have Mr. Ron Rebenitsch. I hope I've got that just about right.

MR. REBENITSCH: Here's my card.

2064

HEARING OFFICER GREGORY: Oh, great. Thanks.

MR. REBENITSCH: My name is Ron Rebenistch. I'm the manager of Alternative Techologies for Basin Electric, and I'm in charge of the wind projects that we develop in -- both the development internally or by the output from.

The area proposed for this federal action contains large areas of world-class wind resource. We're concerned about the potential for this federal action to affect potential development of wind energy projects.

SO-17

2064 (cont'd) Page 50

I was somewhat comforted by the statement that we still will be allowed to build wind projects on private land. However, what we're asking for is a firm declaration in the EIS, in the Final EIS, to include a firm commitment that the federal action will not result in limitations or constraints on the development of wind energy projects.

NP-6

We ask that this commitment come not just from the military but as well from the Federal Aviation Administration which is a cooperating agency for this Environmental Impact Statement.

As I said, I was pleased to hear that the action doesn't affect private property, but it would still have the potential to constrain development of a wind project in instances where other federal agencies that are unrelated to this action here do have a federal nexus to a wind project.

Without a definitive statement now that those agencies don't have to consider this action, it could leave them with unclear direction and that could delay or actually constrain a wind project. Thank you.

HEARING OFFICER GREGORY: Thanks. All right. Mr. Miller, do you want to defer some more?

What I'm going to do is take a recess, and then

if you change your mind, we're going to be up here until 8 o'clock, all you have to do is let us know.

MR. MILLER: Okay.

HEARING OFFICER GREGORY: Okay. So we've heard from everyone who's signed up to speak. We still have some time left.

Is there anyone who's already spoken who would like to add to your remarks? If you do, just let me know. Anyone? Okay. Well, if you change your mind, all you have to do tell me so.

As I mentioned earlier, the Air Force and FAA reps will continue to be available out by those display boards to discuss things with you.

I thank you for your time and interest in coming out tonight to discuss this Powder River Training Complex EIS proposal. And as I mentioned several times, tonight is certainly not the end of your opportunity to participate in the process. Written comment sheets are available at the registration table. You can turn your sheets in tonight or mail or fax them later. The mailing address is on the brochure and comment sheet.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process, but again, to foot stomp this for

you, to receive timely consideration for the final EIS your comments must be submitted by November the 15th of 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter or postcard asking for your own copy and the Air Force will send copies of the Final EIS to you.

Since it's well before 8:00 p.m., what I'm going to do, as I mentioned to Mr. Miller, I'm going to recess the hearing. You're welcome to continue discussions with the representatives. And if anybody changes their mind and wants to make a comment, Ms. Fink and I will be up here. All you have to do is let us know. I'll reopen the hearing and you can make your comment.

So with that, the hearing's in recess.

(The hearing recessed at 7:10 p.m.)

HEARING OFFICER GREGORY: I'll call the hearing back to order at about 7:15. A gentleman in the audience mentioned that his name had not been called. I stated that I didn't have any more cards, but if he'd like to make a statement, he's certainly welcome. He declined to do so and did not provide his name, and to my knowledge we still don't have a

card for him.

But at any rate, we remain here ready for anyone to make comments who hasn't done so before or to add to comments they've already made as I already announced. And if he changes his mind, I'm sure he'll let us know.

With that, I'll go back into recess.

(Hearing recessed at 7:16 p.m.)

HEARING OFFICER GREGORY: The hearing is back in session. It is 8:00 p.m. We have had no requests for any more speakers, so this hearing is adjourned.

(The Powder River Training Complex Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the forgoing Pages 1 through 53 are a true and correct transcription of my stenographic notes.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

2065 Page 35

MR. CAPRA: All I want to say is that we've been happy -- I live out in the middle of this area. We've been practicing over for at least 20 years and we've had -- haven't had any problems with it. In fact, we kind of enjoy watching planes. And I can't see anything, any reason why we shouldn't have this, mainly because they have to practice somewhere and they're there to protect us.

GE-1

PN-1

And, you know, we expect these young people to go over there and serve with their life, and I don't think that it would be asking too much for us to agree with doing what they want to do. I know there's probably some problems, but I think they can be ironed out. Thank you.

GE-1

HEARING OFFICER GREGORY: Thanks, sir. Ms. Schlosser?

MR. SCHLOSSER: No, not yet.

HEARING OFFICER GREGORY: Not ready yet? Okay. Is there a Danny Lannine?

MR. LANNINE: Lan-nin.

HEARING OFFICER GREGORY: Lan-nin? Sorry about that.

2066

MR. LANNINE: Well, we've also lived under the MOA for the last 40 years and we've had considerable problems with the Air Force and it goes back to the

NP-7

2066 (cont'd) Page 36

compliance. They set the rules and the regulations and then don't follow them.

For a good example, when they talk about elevation at 500 feet, or thereabouts, or 1500 feet, it doesn't make any difference. If they want to fly at 200 feet, they fly at 200 feet right through your yard, through your corrals, whatever the case may be.

And there's several flaws in this EIS. For one thing, they don't mention the airplanes that are involved. Almost every ranch in this whole area has airplanes. There's over 214 registered airplanes in Montana alone. There's over 300 in South Dakota. And you talk about only 129 people will be involved with your disturbance? I think your numbers are wrong.

There again, there's no mention of what are the consequences if the pilots don't follow the rules and regulations, of noncompliance. If I fly into Ellsworth, there's an issue. I'll be arrested. If they do whatever they want to do, that's fine. That's for the sake of saving the country.

Well, I'm tired of that whole attitude. I'm not anti-American. Don't get me wrong. But we need rules and regulations just like anybody else. And

NP-7

AM-14

AM-4

AM-14

2066 (cont'd) Page 37

if they're not going to follow them, they don't need to expand this area.

The other issue on the EIS, is there's been no discussion on the unmanned aircraft that's going to be coming in the near future. Somebody in Ellsworth will be flying those planes setting in Rapid City.

AM-17

And the report, there's been no accident reports? There's been no controversy in the last 20 years? That's interesting. There's been several near misses. There's been several people that has been scared to death with -- when one of those planes come over and you're taking off in a small airplane. Then they have been reported to Ellsworth Air Force Base. And on their report there's near zero report of anything going on out here. Everything is hunky dory. I'm sorry. It isn't. We need corrections.

SA-1

The main thing here is, if there's no rules to follow and the Air Force is not going to follow them, they do not need to expand their area.

HEARING OFFICER GREGORY: All right. Thanks, sir. Ms. Schlosser.

2067

MS. SCHLOSSER: Hi. I'm Demarest Schlosser. I came here tonight with my husband Otto and our two kids. This is Lillian and Conrad.

First, I'd like to say I fully support a strong and well-prepared military. I appreciate all the sacrifices that our servicemen and women make for us every day, but they should not place unreasonable burdens on the citizens that they are trying to defend. GE-3

I grew up in Houston, Texas, where it's very noisy and I came out to my husband's family ranch three years ago. I was expecting peace and quiet. The occasional flyover at a reasonable altitude and a reasonable time of day is not a problem. I do have a problem with the extremely low-level flights that are -- that occur at all hours of the day and night. My son is scared of the jets because on several occasions they've flown so low and they were extremely loud. LU-2

I understand that the military needs to practice so that they're prepared to defend us, but I'd ask that they conduct their exercises at reasonable hours of the day and to limit the excessive noise, which is no more than is expected in urban environments. NO-5

I wouldn't subject the homes of our servicemen and women to this kind of noise and I would expect that they do the same for me. Thank you.

HEARING OFFICER GREGORY: All right. Thank you, ma'am. Next I have Mr. John Smith.

MR. SMITH: Do you need help spelling the last name? 2068

HEARING OFFICER GREGORY: I think I actually got the pronunciation right.

MR. SMITH: My comments first all is, I support our troops wholeheartedly. GE-9

The other comment is, the number of people that are seated out here, I counted approximately 40, and I would like the people to know that this seems like a small number to represent our area, but we have very few people living here. I think this is a tremendous turnout for the number of people who live in Powder River County. If you look out, there's about 40 to 50 people here, and that represents a fairly large number of people for our county. NP-3

Next of all, as a pilot I'm very nervous about this deal. I know of one pilot friend of mine that hung his airplane up and just leaves it in the hangar. He's scared to fly with you guys. And I'm just a few miles out of the MOA and I do occasionally fly in the MOA and it can be rather thrilling. If the Air Force could do something in the sense of giving us -- some way of notifying you SA-7 AM-3

2068 (cont'd) Page 40

where we are at, I would truly appreciate that. AM-3
Other than that, this ends my comments.
HEARING OFFICER GREGORY: That's all the speaker cards that I had. Are there any other cards? Anyone fill one out that maybe I didn't get? No? Anybody who hasn't spoken change your mind and want to speak? All right. We've got two more cards here.

2069

MR. HAYES: My name is Francis Hayes. We live out here about 40 miles southeast of here and we've been in this MOA ever since it started, ranchers, pilots, and we've never experienced any problems with the MOA or the aircraft. LU-7 The livestock, we've never had any problems with livestock being spooked or scared or anything. BI-1
And these military people have to be training and have to have a place to train. And I'm not opposed to this at all. I'm in favor of it. GE-1
HEARING OFFICER GREGORY: All right. Mr. McDowell.

2070

MR. MCDOWELL: I'm Don McDowell. The only thing I would say after talking to several pilots and dealing with the Airport Board and things like that, I hear a lot of concerns from our local pilots and I would like the Air Force to understand that

2070 (cont'd) Page 41

you're a closer neighbor at that 500 foot than a lot of these people have ever seen, and I don't think it would be a bad deal if you scheduled an annual meeting to bring your people out and listen to comments annually; instead of us trying to get ahold of you, you came to us. Thank you. GE-5

Did you get the spelling?

HEARING OFFICER GREGORY: Yes, she has the card. Thanks a lot.

Anyone else? Is there anyone who has already spoken who wants more time on the clock? Anybody? Anybody?

Well, we're here until 8 o'clock. That's a ways off. If you change your mind between now and then, all you gotta do is let me know. We'll be sitting right over here. We'll turn the machines back on, I'll reconvene the formal hearing, and you can make a statement if you'd like.

But since at this point I have no remaining speakers, I just want to remind you that the Air Force and the FAA reps will be out there by those display boards to discuss things with you.

I want to thank you for coming out tonight and showing your interest and your concerns about this proposal. And as I've mentioned several times

already, tonight is not the end of your opportunity to participate in this review process. Again, written comment sheets are available at the registration table and you can turn these in tonight or you can mail or fax them later. You see the address and fax number is on that slide and that's also on the brochures and the comment sheets.

Again, the Air Force welcomes comments in writing at any time during this process, but to receive timely consideration for the Final EIS, please get your comments submitted by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please let one of the representatives out there know, or you can send a letter or postcard asking for your copy and the Air Force will send a copy of the Final EIS to you.

And there being no more speakers at this time, I'm going to recess the hearing. But if you change your mind about speaking, Teresa and I will be available right over here.

So at this point we're in recess, and the Air Force and FAA folks will be available out in the hallway to continue discussions with you if you'd like.

(The hearing recessed at 6:50 p.m.)

HEARING OFFICER GREGORY: We're back on the record. The time is 8 o'clock. There have been no further speakers. This hearing is adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the forgoing Pages 1 through 43 are a true and correct transcription of my stenographic notes.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

finally, as I mentioned earlier, this formal part isn't a Q and A session. It's an opportunity for you to put on the record your views and your concerns about the proposal that you want the decision-makers to consider. Questions that you pose during your comments will become part of the record and will be considered.

After we're done with the formal part of this, the FAA and Air Force reps will continue to be available out by those display boards to continue discussing things with you.

All right. And with that, I'll move to our first speaker. And I'll just deal off the top here. How about Mr. Bill Lane. Mr. Lane. You can use this mike here. 2071

MR. LANE: My name is Bill Lane, L-A-N-E. I'm a cattle rancher southwest of Baker as well as a private pilot and aircraft owner.

This expansion is huge and said to be comparable to the size of South Carolina or one-fifth the size of Afghanistan. And if I'm correct, this will be the largest complex in the United States. The Training Complex will limit not only general aviation traffic but commercial traffic as well due to the limitations of radar contact, AM-3

Powder River - Baker 10/13/2010

2071 (cont'd) Page 36

radio communications, as well as the fact that the FAA will not allow IFR traffic to be routed through a hot MOA. Landowners' and/or business owners' rights will be impinged upon by the startling effect of low-level flights, high noise levels, and decreased land values. AM-3 SO-1

And for a comparison, I ask you to think about property values of houses in major metropolitan areas that lie under the flight path of major airports versus those outside. SO-23

We'll also be impinged upon, there will be increased fire danger and then reduced revenue due to the lack of air traffic and recreational traffic. SA-5 SO-6

And once again, this area will no longer be a quiet, last best place. LU-2

Ranchers run the risk of decreasing conception rates in livestock unofficially by as much as 42 percent, thus reducing income for some producers in this area that could result in hundreds of thousands of dollars. There also will be reduced hunting income due to disturbances during hunts. This area is a huge recreational area for hunting by out-of-state hunters, thus a huge economic draw for our area. BI-2 SO-13 SO-9

Ranchers will also face high repair costs due SO-13

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2071 (cont'd) Page 37

to fences being torn down as a result of spooked or confused livestock, not to mention wild game. SO-13

Other risks include fire danger. And unofficially we have heard this, that wool growers may be unable to market their wool as a result of the contamination from the plastic filaments in the chaff. SA-5 SO-16

And also, we will face reduced land values as well. SO-1

And also, for those of us that have airplanes and fly them on our ranches, we will be facing dangerous flying conditions.

This see-and-avoid technique won't work based on the speeds of the aircraft. See-and-avoid may keep you from hitting my aircraft, but what about your wake turbulence? SA-7 It will flip me upside down.

Who or what gives the government the right to impinge on the rights of the citizens? If I impinge on the rights of my neighbors, I can be sued for those infringements. Can I sue and honestly win against the government if they infringe on my rights? NP-1

Let me use this analogy. This is basically like you moving into my house, using all of my resources, destroying my belongings, and not having to pay any rent or pay to replace anything. Montana has absolutely nothing to gain by having this SO-24

SO-24

training facility in our back yard.

The Air Force is here to protect our interests worldwide, but we are here to protect our interests locally. I therefore recommend the No-Action Alternative. Thank you.

HEARING OFFICER GREGORY: All right. Thanks, sir. Next I have Mr. Roger Meggers. Did I get that right?

MR. ROGER MEGGERS: That's right.

HEARING OFFICER GREGORY: Okay.

2072

MR. ROGER MEGGERS: I've been called worse. I'm Roger Meggers. I'm the Airport Manager here at Baker. Last name is M-E-G-G-E-R-S.

This air expansion is massive to this country. I mean, it's just huge. I mean, it will be the largest Military Operation Area in the United States, and the majority of this expansion is into Montana.

This area is mineral rich with more oil reserves than Saudi Arabia. Large coal fields are just being discovered. There's just a lot of impact that's going to happen here in the next few years economically, and with this hanging over our head, we just won't be able to operate.

SO-17

The proposed corridors are based on the

2072 (cont'd) Page 39

antiquated VOR system or the Victor airways which is actually slated for decommission. This routing will also extend flight times and cost general aviation more money to go around these areas. Chaff that's dispensed with the military aircraft will interfere with weather radar.

Some of these stats I have here are greatly different than what the Air Force has come up with. There are over 120 airports in Montana alone. Seven are public use -- or under this area there are seven public use, one airport, over 40 private airports that lay under this proposed expansion. There are over 600 FAA registered aircraft that fly in this expansion area. And how are they going to operate safely when this is hot?

Initially we thought this was going to be about 10 days a year. We find out now it's going to be in excess of 240 days a year.

This proposal will save the Air Force 8 and a half million dollars per year. The economic impact of Montana airports are as follows: 18,800 jobs; $600 million in payroll, and $1.6 billion in economic activity. That's just in the State of Montana.

Approximately $20 million has been spent on

SO-7

SA-16

AM-4

PN-5

SO-10

2072 (cont'd) Page 40

ADAF funding on these airports that lie -- public airports that lie directly underneath this proposal, with an additional 13 million proposed to be spent within the next two fiscal years. Why have we spent all this money on these airports when they will be severely restricted with this expansion? SO-10

I feel this proposal is well greased and sliding along under the radar without a lot of public input. There's quite a few people here tonight, but a lot of these meetings are not very well attended. A lot of the pilots know nothing about this. You talk to the transients that come through my business and they don't know anything about it. "How are you going to operate through it?" "Can't. We're not going to. We're going to go around it." NP-8

Nothing has been said in this EIS about the Ellsworth Air Force Base becoming a command center for the Predator UAV aircraft. I don't know exactly what's going on there myself, but that's the rumors I've heard. AM-17

I feel the elected officials are being held hostage on this because they do not want any more Air Base closures in this area. We can't afford that for our economies. Contractors and engineers SO-25

2072 (cont'd) Page 41

which I've talked to, they're afraid to say anything for fear they will lose contracts that they currently have with Air Bases.

And anyone that opposes this seems to kind of be painted anti-patriotic which is not true. I very emphatically support our troops and we need a strong military. GE-9

And one last thing and I'll wrap up here, but general aviation can't accept this without some serious changes, but the B-1 is capable of top speed of 830 miles an hour. That's 13.84 miles a minute, 1218 feet per second, which is almost twice as fast as a .45 caliber bullet, and that's four seconds a mile. I hope you guys don't get lost. Be a long ways home. But see-and-avoid just doesn't work at 800 miles an hour, and that doesn't even include closure speeds. SA-7

And as for myself, I've been a pilot since 1969 and logged over 16,000 hours of civil flight time. I'm a commercial pilot flight instructor and I've operated my business at the airport for -- since 1978. And I'm not sure my business will survive this expansion if it goes through as it's written because of the limitations that will be imposed. Thank you for your time. SO-10

HEARING OFFICER GREGORY: Thank you. All right. Thank you, sir. And next I have Darin Meggers.

2073

MR. DARIN MEGGERS: Okay. My name is Darin Meggers, same spelling as the last speaker.

I'm a third-generation pilot and have been involved in aviation for as long as I can remember. I've been actively flying since 2001 and I've accumulated over 3200 hours of flight time to date under multiple ratings and endorsement; been an operator at the local FBO here in Baker, Baker Air Service.

This is a full-service FBO providing fuel sales, aircraft maintenance, repair and modification, aircraft sales and demo, contract and specialized flying, flight instruction, aerial photography, charter, aircraft salvage and recovery, and other aircraft pilot amenities.

Its yearly average at 22,000 gallons of fuel sales; maintenance, 40 aircraft; a thousand hours of commercial flying; eight aircraft sales; and currently operate five aircraft in the business and employ eight people.

There are major concerns that have come up with the huge expansion of the Powder River MOA both in

2073 (cont'd) Page 43

square miles and vertical boundaries of the airspace. Safety is a major concern for all pilots flying and on the surface for the people and livestock and animals. The majority of the pilots will avoid because they don't want to deal with the risk of the MOA.

As an FBO, this will have devastating effects on the economics of Baker residents if this expansion happens in more ways than one.

How can you operate an FBO business underlying this airspace and surrounding Baker for nearly 150 miles in every direction? There's no way you can confidently tell people that this airport and this business is alive and well with this airspace hovering all around. Corporate and commercial flying in the area will just not be happening.

Right now talking with pilots personally and additionally with their companies, they will make alternate plans to avoid complications, risks, and costly delays of the airspace.

Flight instruction isn't looking real attractive either. Try to talk a student into flying among military aircraft at 500 plus mile an hour when they can barely figure out how to fly at first. No IFR training in our area.

SA-7
SA-9
SO-6
SO-6
SO-26

If no airplanes are stopping because of the airspace, that means no fuel sales, aircraft repairs, sales and demo and general maintenance, all a huge part of an FBO business, not to mention all the local businesses downtown that give them a courtesy card to go eat and go to the grocery store or whatever they need to do or stay the night. SO-6

Operation of a full-service FBO underlying this is simply not going to happen. It takes all aspects to make a go of a small-town FBO providing all services. There is no reason to talk expansion and growth of the business when this airspace will take away all the customers.

Even though this is a sparsely populated area, it is one of the busiest areas in the United States and probably one of the most likely areas for expansion. The U.S. unemployment map can prove that. Look around Baker alone with the development of oil and gas industry, utility and wind energy, the medical facility, farming and ranching and outdoor recreation that takes place. Corporate and commercial aviation in the area would be affected directly. SO-5

Just in Baker alone, there are over 12 oil or utility companies that operate their base in Baker,

2073 (cont'd) Page 45

plus all the on-demand flying that is related with the sport and service that they need.

What you're asking for cannot be done. This needs a lot more compromise to let the general aviation community survive as well as the corporate and commercial operators in the area of the proposed expansion. Thanks for your time.

HEARING OFFICER GREGORY: Thank you. Mr. Donald -- I think it's an "L." Lieger?

MR. RIEGER: Rieger.

HEARING OFFICER GREGORY: Krieger. Should have gone with the "K."

2074

MR. RIEGER: Donald Rieger, spelled R-I-E-G-E-R --

HEARING OFFICER GREGORY: "R."

MR. RIEGER: -- presently serving as Fallon County Commissioner.

We as a county have a huge stake in what takes place here. Some of the things have been mentioned.

The air ambulance situation, we've gone over that. Yes, you indicate that there can be a phone call and they will hold off for air ambulance, but we all realize what it takes to make a phone call, especially on a weekend or something, and get a live voice. Most often it's a recording. The recording

SA-19

turns you to another phone number to call or passing down of the line, and you can wait a long time until you get a live body, if you do. SA-19

Another thing is the fire suppression that we have in here. We have the capabilities when they do have a fire to come in here with aircraft. They use our facility here and they possibly even take on some fuel here. But that's something that we are very dear to our hearts about and we do not want to leave any of that out. SA-5

Another thing is, we've got a new airport expansion project in the move and what we would be doing is extending the runway. And it seems to me like if all this is going to take place, why are we doing what we are as far as putting more improvements into our airport when it will be very limited use. SO-10

As has been mentioned before, the oil activity that's here is huge. And there's many, many direct flights come in from Texas and thereabouts, come in in the early morning hours, leave again in the afternoon, and those are very dear to the community also. SO-17

With the TransCanada pipeline that's in the making would come through here, there's 67 miles

2074 (cont'd) Page 47

that come through the county. There would be an on-ramp you might say that would include shipping oil in here from various parts of the Dakotas, Montana, and they would be held in facilities here so that they can put it into this TransCanada pipeline. With that, that will bring many more pipelines to the area, more business, more business will be moving to Baker because of this situation, and that again is very essential to the county. SO-17

I wish I could stand before you and say I trust everything you say. We happened -- two of the Commissioners of the three happened over to Mocha where there was a meeting over there on land use or with the BLM adhering property there for a wildlife corridor. There was 3,000 people in attendance over at that meeting and various people gave testimony there. And there again, they were lied to, and the indications came out of there, too, that we wish we could trust you, but we can't. And this is about the situation here. We hear the stories, but can we really trust you? GE-5

Montana has a state law that there's a cooperating agency status, and I hope if this gets into the final stages or something, that you would participate with the local officials and take NP-4

2074 (cont'd) Page 48

comment from them and be more involved so we know we can share some ideas, and that's what the cooperating agency status is all about. NP-4

Do you adhere to our land use plans that we have within the county? I think this is moving forward. I don't think there's any consideration of the individual land use plans that we have in our county, and I think they should be taken into consideration. LU-8

So we have various things at stake here, and therefore we would find it hard to support this maneuver and have to go on record as being opposed. Thank you.

HEARING OFFICER GREGORY: All right. Thanks, sir. Next I have Mr. Dennis Twedt.

MR. TWEDT: Yep.

HEARING OFFICER GREGORY: There you go.

2075

MR. TWEDT: My name is Dennis Twedt, T-W-E-D-T. I'm a member on the Airport Board in Baker.

And there has been a lot of things that's been said that's too vague in my book as far as "expected to fail," there's "may be activated," definitions of "approximate." It leaves too much -- too much open there; not -- nothing definite, not holding down a positive yes or a no. Interpretation of the Bible, NP-9

so many different religions, so to speak. That's what scares me.

And I back that up with Donald; that we see that get into this part of the country and -- and once they get their foot in the door, it's a lot of different things: like say 10 days a year and we find out through the grapevine that it could be up to 200 some days a year. That scares me. PN-5

We talk to other pilots that come in and out of Baker in the past and tell them about this proposal and they said that they would probably be more than likely avoid it and they wouldn't come here just because no one wants to fly in an area like that.

And personal experience in the past, in the middle '80s working in the oil field they had two different places that they had military routes. After a fashion of time we learned of where these routes were and they flew right over those routes, just about count on it, and at a certain time about every week. And that was good because then we knew to avoid those areas at that kind of special time. But still, that was well below 500 feet. And who is to police that? AM-14

And it scared a hell of a lot of people a lot of times out in the oil field. I mean, it's -- it

caused a lot of hardship. By the time they seen it, it was gone. And then you start looking for the second one to come and then it was, you know, not so scary.

That's what I'm scared of now, a whole big route. It isn't going to be just one little route. So you ain't going to know where they're at, where they're coming, and it's going to shrivel a lot of people and animals. That's all I've got to say. SA-7

HEARING OFFICER GREGORY: Okay. Thanks a lot. All right. Thanks, sir. Next I have Mr. Willie Duffield.

MR. DUFFIELD: Thank you, sir. My name is Willie Duffield, D-U-F-F-I-E-L-D. 2076

I want to thank you gentlemen for serving this country. I think the United States Air Force is the best Air Force in the world, and I think you've got that way and you've trained that way in the current Military Operation Areas that we have now. I think they're adequate. GE-9 PN-2

I guess I want to go on record as opposing this expansion on that ground; that we have adequate training areas. I think the Air Force is going to have to do what the rest of us in the country is doing. We're trying to do more with less. And I GE-2 PN-2

think -- I think that would be a good thing for the Air Force to try to do on this.

I know we're supposed to limit our comments to the environmental issues of this thing. My concerns are more safety than environmental.

You're squeezing general aviation into a smaller area into these bi-way -- or these fly-aways in between these. I don't know which is more dangerous: putting 25, 30 general aviation in a little bitty airway or flying in an MOA with these jets. So I guess I would like you to reconsider that a little bit; making those wider if this is going to go. SA-3

Also, I would like to see them just stay up in the air 15,000, twenty feet, and leave us alone down below. They can practice from there to the moon. I will yield the rest of my time. DO-4

HEARING OFFICER GREGORY: Okay. All right. Thank you. Mr. Chuck Lee. 2077

MR. LEE: My name is Chuck Lee, L-E-E. I'm the Disaster Emergency Services Coordinator and the 9-1-1 Coordinator here in Fallon County.

I'm real new to this tonight. I'm just trying to get a handle on this, but I kinda made some notes. So these are the things I noticed that kinda

2077 (cont'd) Page 52

hit me right off the bat.

I know in the NEPA, they talk about environmental justice. And that's kind of a weird concept. It's the concept that you take a low income area and you dump on it so you turn it into a toxic dump. You know, we've seen that through the years. And I'm not implying that, but what I'm saying is that because of our rural nature and we don't have a lot of population so we have no pull with the politicians, that it just seems that this area has been chosen because it's a quite expansive land but it's also very few people.

EJ-2

And I guess the question -- and I don't -- once again, I'm new to this so I don't understand why don't we go to Rapid City? Why don't we go to Pierre? I notice it tends to come where there's not a lot of political clout. And we all know that dealing with the state government here in Montana.

PN-2

Roger made mention of the Doppler radar. The one thing is that effective January 1, 2011, through December 31st, we will have Doppler radar for the first time in Fallon County. This has been, Roger, probably 15 years you've probably tried through the Department of Commerce and/or the National Weather Service and they always cry there is no money.

SA-16

There must not be any money. We found a way to do this locally, and so effective January 1st through December 31st we will have Doppler radar coverage.

My concern is, now we have Doppler radar and now we have chaff that's going to block that. This radar coverage will be critical for calving seasons or -- and counties, Dickinson, North Dakota, for example, even though they have Doppler radar coverage now, they've ponied up money because they want to see what's coming at them. The storm comes out of the southwest through Broadus and blows to the northeast. They want to know what's coming at them.

SA-16

So I'm concerned that we're going to get radar and now we're not going to get radar. So that's kind of an interesting thing.

From the 9-1-1 side, Fallon County is fortunate enough to have a pretty extensive 9-1-1 system. We do cover four counties, 8,000 square miles. Two of the counties will be affected.

I'm just concerned about, you know, several things there. You mentioned the miners and the frequency issues. My concern, of course, is running all kinds of different frequencies, I wonder what effect this will have on us. I'm concerned about

AM-3

2077 (cont'd) Page 54

dispatch overload. I'm concerned about first responders.

It was mentioned earlier one accident in 1997. That would have been Carter County, I believe. What taxing effect would that have on our first responders in this community if a B-1 -- is it a B-1; is that correct? -- okay, if a B-1 goes down. We're going to be -- we're going to be scrambling, you know, to deal with something of that level.

So I'm concerned about the communication. I'm also just wondering about the noise. You can say that it's supersonic and the charts might show that it has no effect, but quite simply, it has an effect on what I'll call our way of life. I've only been here 15 years. I'm from another faraway land called California. I was born in Bowman, so it's okay.

So I just understand, it's going to have quite an effect on this way of life out here. It's nice and quiet. People are salt of the earth. It's the place to live. And so now we're going to get, you know, blown over with a bunch of -- a lot of air traffic and a lot of noise. And you can't quantify the effect that is, but what we know as our way of life will be drastically affected from this.

And I just have one further concern that Roger

AM-3

SA-20

LU-2

talked about, is this idea that Roger -- one of the primary things I think his business does is they fly the pipelines to visually inspect for leaks and/or damage, and I'm just wondering what kind of effect is that going to have that if something happens that we have an oil pipeline that's leaking and we're not able to detect it, Roger could see it visually from the air and all of a sudden he's grounded, and does a half a day go by, a day go by, and what kind of effect does that have on the environment. So that's all I really have. SA-21

HEARING OFFICER GREGORY: Okay. All right. Thank you very much. Next I have Mr. J. Robert Rusley. I hope I got that right.

MR. RUSLEY: Yes.

HEARING OFFICER GREGORY: All right. There you go.

MR. RUSLEY: Robert Rusley, J. Robert Rusley, R-U-S-L-E-Y, rancher southeast of Baker.

I've put up with this here low-level flying for some period of time, from early back in the '70s. And it is a real hazard to livestock. I have had cattle run through the fences and horses cut up. SO-13 It's a terrible deal. And I didn't get paid for it. SO-1

Another episode now, the devaluing of my

property. You can't tell me if you're trying to sell your ranch and you've got a fly-away running right over, that your value of property isn't going to go down. Maybe it's worth five, $600 an acre at the present time. By golly, if this fly-away goes through, you'll be lucky if it's worth 200.

SO-1

Also, this chaff material, and Roger mentioned this, as far as lambs and stuff and the wool, I think that is an issue. I think they should look into this. I mean, any plastic twine and anything, that wool is condemned. Why would this be any different? It's a silicon base.

SO-16

Also, many of the other local ranchers around here, I don't -- I don't fly, but it's going to be quite an impact on them as far as flying to check livestock. A lot of them use their planes to check livestock, water tanks, wells and, you know, and just in regards to their business.

SO-11

That's all I have. But it's a large concern of mine.

HEARING OFFICER GREGORY: All right.

MR. RUSLEY: Thank you.

HEARING OFFICER GREGORY: All right. Thank you, sir. Next, Mr. Sikorski.

MR. SIKORSKI: My name is Wade Sikorski. We

have a ranch 20 miles south of Baker.

I was -- it was back in the '70s, I remember when we had some B-52s and occasionally a B-1 bomber flying over us, and I think that there's going to be quite a bit different impact from low-level B-1 flights than there will be from the B-52 flights because there -- they happen much more quickly and they're much more louder as I remember it.

And I think it's kinda like you don't -- when a B-1 comes over you, you don't grasp what is even happening. It's just kind of an explosion and then you don't see it, or a lot of times I never saw it. I just sort of heard this explosion and then it was gone. Now, B-52s were slow and you could kind of see them coming sometimes. Most of the time you kinda get used to them.

SA-9

And I'm thinking that the startle impact on livestock will be quite a bit different from low-level B-1 flights than they will be from the low-level B-52 flights, which we aren't going to have, I gather, because it just happens so quickly.

And animals in my experience, once they've been startled, they kinda get to where they start anticipating it and it happens again, they get quite unmanageable.

BI-4

2079 (cont'd) Page 58

We have -- we live right beside the highway and we have a stockade that -- between the barn and the highway. And I remember a time when we put some cattle in by the barn and the cattle couldn't see what was coming on the highway. They would hear the noise, but they couldn't see it or understand it. And they were steers and they became totally unmanageable. I mean, they broke through stockades that I couldn't imagine a cow going through, and they started going through fences, and we figured out it was just when they were on the other side of the stockade, they could see the traffic coming at them, they could handle it. They didn't go wild. But when they were behind the stockade and couldn't see the traffic, they just went totally berserk.

I think that that would suggest that there's going to be a difference between B-1 overflights and B-52 overflights. B-1s are going to startle animals quite a bit more and become quite a bit more of a problem than back when we just had B-52 flights. BI-4

My second major concern is that, I read an article in the New York Times about two weeks ago that said that the Air Force was opposing the development of wind power at various sites around the country. It curtailed -- it curtailed the SO-17

2079 (cont'd) Page 59

development in some areas and it never really stopped them, but it was -- it raised objections to it. And this is an area, North Dakota, South Dakota, Montana, that has a huge potential for wind power development. And I really would hope that the Air Force did not limit the development of air -- wind power in this area. Thank you.

SO-17

HEARING OFFICER GREGORY: All right. Thank you, sir. That's all the cards. Oh, we've got another one here? Okay.

MR. TRONSTAD: I have one here.

HEARING OFFICER GREGORY: Excellent. Thanks.

2080

MR. TRONSTAD: John Tronstad, T-R-O-N-S-T-A-D. We have a family ranch south of Baker. And in my younger days we were, probably around 1960, we were pretty much in the middle of a B-52 fly-away. And I'll always remember as a 10-year-old when the B-52s would come over at night and bring you out of bed. It's something that stuck in my mind, you know. It's -- it is a noise issue.

SO-18

I also fly and I've been -- been a pilot for years. I've had many aircraft over the years, flown through a lot of these areas. And to say that we probably don't have many mid-airs, I've been -- I would not want to count the times that I've probably

SA-1

2080 (cont'd) Page 60

been able to read the numbers on the side of aircraft that went by that they probably didn't even see. There's probably ones that went by that I didn't see. SA-1

So I think it's a real concern. You know, it's like the saying goes, if you put two -- two beebees in a boxcar and they roll around long enough, pretty soon they're going to run into one other. And I think it's a safety hazard.

We have the peace and quiet, you know. I'm kind of a -- it's a little bit like Bill talked and many. I would be echoing that, too, that we -- we have some man that comes from Hamilton. He's brought his first son here to hunt, and he commented, they spent a whole day in this one area out stocking deer, he said, "There's no noise, there's no cars, there's no vehicles, there's no people, there's no airplanes." So I got to where when I fly during hunting season, I'm pretty careful where I go. I don't want to get shot down. You know, they're pretty -- they look at you. I've had some hunters get pretty upset about it. Anyway, he's going to bring a son this year that is his first hunt, too, because of just the quiet and peace. LU-2

2080 (cont'd) Page 61

And the land values, I can see that land values would definitely sag. We have a lot of people that come through this country buy land just because of the quiet. We're kind of the strip of the last best place. I think it's a real issue. SO-1

I don't know if the government -- or the Air Force would be willing to compensate people for that when those sales go down in price or not. It's a concern.

I guess I would go down as being opposed to it. I know we have a wonderful military. I'm not opposed to them training, but I would think there should be some options other than where we're at. GE-2

I also had an interesting thing, I'll give this to Ms. DeVine, about is living under a flight path bad for the heart. And there's some studies done that say if you're in the flight paths, that the risk of heart attacks is greater. SA-22

And then also, part of what Ms. DeVine said on a lot of those things, the maybes and the ifs of things that could possibly happen, when I listened to that last part of that presentation, I wonder why I would be in favor of it. That's all. Thank you.

HEARING OFFICER GREGORY: Thanks a lot. Any more cards? Here we go. I'll let you introduce

2081

yourself.

MR. TUNBY: I'm Randy Tunby, T-U-N-B-Y. I'm a rancher north and west of Baker here. But I'm also here not only talking for myself but as a representative of the Montana Wool Growers Association.

As several people have mentioned in here, the chaff is an issue that we are concerned about. I definitely think that needs to be reviewed and studied a little bit more. Any metallic fibers or poly will contaminate wool, and the chaff seems to have that makeup. And looking at the sample of that, I -- I am concerned about that and we are concerned as an industry. SO-16

Just as an example, a warehouse in Belle Fourche, South Dakota, information from a Larry Prager, the manager of that, in the last two years they have sold a large amount of wool there, but their wool in the last several years, a big percentage, in fact 80 percent of that wool goes to military use. So it's kind of ironic. The dress uniforms that you gentlemen are wearing, a lot of that is produced from wool in this area. And I would sure hate to see a contamination issue not allow that to happen. So anyway, that is one

2081 (cont'd)

concern.

The other concern we have as a -- as I have as a personal individual and as the Wool Growers Association is the predator control and wildlife services along with private pilots. Wildlife services is a USDA Avis agency. They fly and help control predators. Predators are the number one issue facing those in sheep production and it's quickly becoming a major issue for the people in cattle production, too. And if we are curtailed in being able to fly and take care of these predators during critical times, they're flying in hot zones or different things like that, they're -- I know visiting with some people, they are worried about the vortices from the wake and things like that, we sure don't want that to be an issue.

We would like to see at least good communication and things. I'm sure the FAA and the Air Force will work with that. I know that the wildlife services contacts where they have existing fly zones, they contact ahead of time to see, you know, what is going to be occurring that day. But that is just another chain of command.

As was mentioned earlier, you know, possibly you're running out of time during -- to get an

SO-15

SA-7

AM-1

AM-12

2081 (cont'd) Page 64

animal that is causing problems. You've had weather problems or delays or something and you couldn't get in the air, and then a day when you're able to fly, all of a sudden you're in the middle of a training zone and they can't get up. It costs us a lot of money on the ground when the predators take control. SO-15

So anyway, thank you.

HEARING OFFICER GREGORY: All right. Thanks a lot, sir.

And we'll take a quick break while she changes the paper in that machine.

(Brief pause.)

HEARING OFFICER GREGORY: Anyone else that has a card that wanted to speak? Anyone?

MS. RANUM: I don't have a card, but I would like to speak.

HEARING OFFICER GREGORY: Okay. We can get you a card. We have plenty of them. Come on down. We'll just do it up here.

2082

MS. RANUM: Thank you. I'm Deb Ranum. I'm a County Commissioner for Fallon County, and I am opposed to the flight pattern that you are proposing and I ask the military to consider the No-Action Alternative. GE-2

When the lady was speaking, she mentioned that

2082 (cont'd) Page 65

the decision-makers of the EIS, the visitors to the area may find the noise annoying, and I'm sure they will. And it's also going to affect the value of our property. SO-9 SO-1

But doesn't silica also contain cancer-causing agents? And I'd like the military to consider looking into that further. Thank you. SA-14

HEARING OFFICER GREGORY: Anyone else? Is there anybody who already spoke that would like to expand on what you said? Okay. I was thinking you had a little bit more on that sheet. I didn't want to put you on the spot.

MR. ROGER MEGGERS: She shut me down earlier, so...

HEARING OFFICER GREGORY: Yeah, well, as they say in football, put another three minutes on the clock.

2072 (part II)

MR. ROGER MEGGERS: I won't take that long. A couple little things that just come to mind sitting here listening to some of this information. A lot of this information has come up, you know, even tonight. We've been handed it in the handouts.

Once this is in place, say it goes through, are there any procedures in place to suspend it or modify it if there's problems? None of that's GE-10

2072 (part II)
(cont'd) 10/13/2010

Powder River - Baker

Page 66

addressed in any of this EIS.

Say there's a problem in part of the area that's causing a lot of problems or something like that. Can it be, you know, part of it suspended?

A lot of people don't check NOTEMS. I know the FAA probably doesn't want to hear that, Mike up there. But, you know, my business, we have contracts to do, I mean a lot of places to fly and pipelines to check and we got a lot of area to cover. In the wintertime the days are short. A lot of times we'll leave in the dark -- or just shortly after sunrise and get back right at dark, fighting weather, whatever. The days are long. We can't delay it. I mean, we have to be the next place the next day.

These pipelines are required that they're flown by the Department of Transportation. Pipelines, interstate pipelines have the same regulations under DOT as over-the-road trucks. We have to be drug tested to fly the pipelines and observe them. We don't have to be drug tested to fly. It's on account of the pipelines. So it's a different set of regulations.

How about the comments on this -- that are given to the Air Force? Does the FAA see them or is

GE-10

AM-12

SA-21

NP-5

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2072 (part II)
(cont'd) 10/13/2010

it separate or -- I mean, we don't see that either. I mean, are these comments transparent? I mean, does the Air Force look at them or the FAA look at the Air Force comments? Where do we send the comments to the FAA?

NP-5

A lot of the mid-airs that are close, a lot of times most people don't report them. I mean, no harm, no foul. We've had some I wouldn't say mid-air -- potential mid-airs, but we've had some close encounters. We fly currently extensively in that Military Operations Area around Belle Creek, which by the way is slated for major expansion with Co2 tertiary recovery. And the oil field down there, it's recently been bought out by another company, Denver Resources. And things are going to change in that Belle Creek area shortly.

SA-1

And so, consequently, I mean I guess I recommend either No-Action or this thing modified where it's the floor of the airspace is pushed upwards, you know, less impact to the general aviation. Not that we don't want to share our airspaces, but the lower levels. Hopefully something can be worked out that way.

GE-2

HEARING OFFICER GREGORY: Okay.

MR. ROGER MEGGERS: Them are some of my

2072 (part II)
(cont'd) 10/13/2010

Powder River - Baker

concerns. I guess the biggest one was is just to see if there was anything in place for anything to -- any of the procedures to suspend or modify this complex. AM-12

HEARING OFFICER GREGORY: Okay.

MR. ROGER MEGGERS: Thank you.

HEARING OFFICER GREGORY: Anyone else like to expand on your remarks? Well, we've still got some time, about a half an hour before we're set to adjourn.

So what I'm going to do, I'll go ahead and recess the hearing at this point. And the FAA and Air Force reps will be available to continue discussing things with you. And if you change your mind about making a comment or adding to your comments, Teresa and I will still be down here, and what I'll do, I'll reopen the hearing and then you can go ahead and make your comment.

But just in case no one comes back to me, let me go ahead and close this out.

AUDIENCE MEMBER: Can I ask a quick question on procedure?

HEARING OFFICER GREGORY: Sure.

AUDIENCE MEMBER: Did I understand you correctly to say that written comments have the same

weight as public comments?

HEARING OFFICER GREGORY: Yes, they do. And there's no page limit on written comments.

AUDIENCE MEMBER: Okay.

HEARING OFFICER GREGORY: And the main thing is, you just need to get those in by November the 15th.

AUDIENCE MEMBER: And there's forms here for that?

HEARING OFFICER GREGORY: There are forms here for that right there at that table in the back.

2073 (part II)

MR. DARIN MEGGERS: I'd like to talk again on the tape, if I could.

HEARING OFFICER GREGORY: Okay. You, too?

AUDIENCE MEMBER: No. I was just going to say, if we have time, would it be possible to do a short Q and A with both the FAA and --

HEARING OFFICER GREGORY: Well, they're going to be available out by those display boards and you can discuss whatever you'd like to discuss with them.

AUDIENCE MEMBER: Okay.

HEARING OFFICER GREGORY: The FAA guy will be out there and the Air Force reps, too.

AUDIENCE MEMBER: I see.

2073 (part II) (cont'd)

HEARING OFFICER GREGORY: I'm just going to recess in here for the formal part. But, yeah, they'll still be available out there to discuss things with you. So come on back.

You're the other Mr. Meggers, right?

MR. DARIN MEGGERS: I am.

HEARING OFFICER GREGORY: Okay.

MR. DARIN MEGGERS: Bad habit. All right. I would just like to talk about flying in the MOAs. One time I come out of Nevada and landed in Gillette, Wyoming, come out IFR and landed in Gillette and got gas, and of course we had to transition through the Powder River MOA. And with the radio communication, radar coverage in this area, it's difficult to fly IFR doing -- from below 10,000 feet just because you're -- you don't have radar contact. You can't talk to nobody. So I elected not to file IFR coming out of Gillette.

AM-3

So I come out of Gillette and hiking along at 310 and all of a sudden here comes a B-1 and here comes another B-1. So this see-and-avoid thing is a hard thing to do. I didn't -- I didn't see them, you know. If I would have filed IFR, they wouldn't have let me go through it. And it's a direct route between Gillette and Baker. I would have had

SO-7

2073 (part II)
(cont'd) 10/13/2010

Powder River - Baker

another hour and a half of my flight time and there's more expense and everything else. SO-7

So we all know flying IFR, that it's not allowed. You know, you can look at all the existing MOAs, all the GPS weigh points around the perimeters, you know, they're there for a reason. They file around.

You know, I've talked to the VFR pilots that come through Baker. They don't want any part of it. SO-10 They're out there to enjoy the freedom that they have. They don't want to be hitting the GPS to get away from all the airspace alerts and they want to enjoy their flight. They don't want to worry about getting run over. SA-7

You know, the other thing is the hospital, the medical complex here. They're going to suffer from this in more ways than one, too. You know, getting that Life Flight in here, I don't -- I just don't see how that's going to work. SA-19

On demand, you know, with these people, time is of the essence. And we've already talked about that, trying to get a hold of people to go now. You know, there's a bunch of people that fly into Baker to visit our medical complex. We have an AME on staff here. He's the best in the area and people

2073 (part II)
(cont'd) 10/13/2010

Powder River - Baker

come from everywhere to get their flight physical from him. And we're very lucky to have these services in Baker.

I guess with that, thanks.

HEARING OFFICER GREGORY: Okay. Thanks a lot.

MR. LANE: Can I make one quick comment?

HEARING OFFICER GREGORY: Sure. Come on back up.

2071 (part II)

MR. LANE: Bill Lane. This will be short. I just -- my wife works at the clinic here. And I do know, going on top of what Darin just said, that there are a lot of doctors that fly in here from Billings, I know North Dakota, South Dakota, that they come in here to provide a service to the Baker area. However, this wouldn't be considered an emergency flight into the area, so -- but they are always flying IFR into this area. So that would limit the amount of specialized care that we could get here in the Baker area.

SO-5

And that was just something I wanted to add. Like I say, it's not an emergency, but it is providing a service to this area. Thank you.

HEARING OFFICER GREGORY: All right. Thanks. Thanks a lot. Anyone else at this point? Anyone?

As I said, what I'm going to do is recess the

hearing. Since we've still got some time until 8 o'clock in case anybody changes their mind about making an oral comment here tonight, but in case no one comes back, let me just go ahead and make some concluding reminders here.

As I've mentioned a couple of times, tonight's not the end of your opportunity to participate in this process. Those written comment sheets are back on that table in this room right at the back. You can turn them in tonight or you can mail or fax them later. The address and fax number are on that slide and they're also on the brochures and the comment sheets.

You can submit your comments at any time during the process, but to receive timely consideration for this Final EIS, let me foot stomp this one more time, all comments must be submitted by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives outside at the registration table or you can send a letter or postcard asking for your own copy and the Air Force will send copies of the Final EIS to you.

The Air Force and FAA reps will be available out by those boards to continue discussions with

you. And I'm going to go ahead and recess at this time. And if you change your mind about making a comment, just come on back down front here. Teresa and I will be here and we'll reconvene the hearing and get your comment on the record. All right. So we'll be in recess.

(The hearing recessed at 7:35 p.m.)

HEARING OFFICER GREGORY: The hearing's called back to order. One of our speakers wants to add to his previous remarks. Sir.

2074 (part II)

MR. RIEGER: Don Rieger, R-I-E-G-E-R, again as Fallon County Commissioner.

And a couple of questions or statements I would like to add to the information that's been already given.

Again, when we consider air ambulance coming into the area as was indicated earlier, you know, this services -- our medical facility services quite a large area, and many times people are -- patients are brought in here and of course air ambulanced out of here.

When an air ambulance is called upon, I suspect they would call in and get a clearance. And if there was a training exercise going on, my question is, is when the air ambulance gets clearance to come

SA-19

2074 (part II)
(cont'd) 10/13/2010

Powder River - Baker

into this locality, they will not leave or they -- the medics from that air flight go over to the medical hospital and they stabilize a patient before they will leave with them. Sometimes that might be 15 minutes. The next time it might be a couple hours to maybe more. Until the patient gets stabilized, they will remain here and then fly out.

SA-19

My question is, is if they get clearance, will they totally abort the training exercise or will they just delay it as long as that air ambulance is here.

The next thing is, the sage-grouse is a huge issue with the environmentalists. We deal with that quite rampantly in this area with the oil and gas development or the development of natural resources. The interruption of their leks or their breeding cycles and so forth, if the sage-grouse can literally stop road construction or firing up heavy equipment or something while they're actually in the mating season, how would this affect if there was sonic booms and training exercise that would disrupt that. That's a concern.

BI-3

Third question I've got is with this TransCanada pipeline that's coming through here. This is all going to be imported steel. It will be

2074 (part II)
(cont'd) 10/13/2010

Powder River - Baker

Page 76

outside the United States. And they have made a formal request to the federal government requesting that they can get an allowance to increase the pressure more than the recommended pipe velocity or whatever it is. Anyhow, they are requesting to increase the pressure or use thinner pipe in the remote areas, and in the urban centers they would use the heavier pipe just because of safety fractions.

But my concern is, is these sonic booms and that, certainly that will make the ground tremble and that, would that have an impact on those pipelines. If it does, I mean we're talking a 36-inch pipeline that's capable of running -- or flowing probably a million barrels of material a day.

SA-23

When I talked earlier about this on-ramp with the adding oil out of this Bakken plate, they would give allowance that they would be able to transport 100,000 barrels a day that they would put in this pipeline here.

So there again, I mean, you know, if there would be a rupture of a line, that would be a huge environmental issue.

SA-23

But those were some additional thoughts I

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2074 (part II)
(cont'd) 10/13/2010

thought of while I was remained seated back there. So thank you.

HEARING OFFICER GREGORY: Thank you very much.

(The hearing in recess at 7:50 p.m.)

HEARING OFFICER GREGORY: It's 8 o'clock. We had a couple of additional speakers that are already in the record and there is no one else who wishes to speak. So with that, this hearing is adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the forgoing Pages 1 through 77 is a true and correct transcription of my stenographic notes.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

here. First, please limit your comments to the Draft EIS. That's the purpose of the public comment period. Second, if you agree with a previous speaker on something, you can certainly say that, but you don't need to repeat it since it's already in the record. Finally, as I mentioned earlier, this formal part is not a Q and A session. It's an opportunity for you to put on the record your views, your concerns about the proposal that you want the decision-makers to consider. Questions that you pose during your comments will become part of the record and will be considered.

After we're done with the formal part of this, the FAA and Air Force reps will continue to be available by these various posters and boards and things to discuss things with you.

And with that, Mr. Drayton.

2083

MR. DRAYTON: I see only one being held up. Are you gonna give me six minutes to start with?

MS. MOYER-DURHAM: I will give you as much time as you need, sir.

MR. DRAYTON: I've got a visual aid with me tonight that I think's a little more important than propaganda that we've seen here tonight.

You know, this really surprises me. I'll bet

you holler a lot more at the visiting referees and coaches than you're going to holler or say anything tonight. I've been to -- this is my third meeting in the third state. I started out in South Dakota, went to North Dakota, and now over here in Montana. I was hoping to hear a lot of comments here tonight. Maybe you've already sent them all in via the print method, and I guess I hope that's what you did.

If you're not traveling with some of this luggage that I've got, you're not traveling with much. I've got the Draft EIS and on top of that the appendices that go with the Draft. And when you get up and talk like this, the other two meetings were fairly easy, but I've had time to go through these things now for a couple of weeks and it made it damn hard tonight to decide what to ask and what to tell people.

The Air Force went ahead in 2007 as they stated and got the cooperating agencies involved, the FAA. Remember the FAA, this is the one that you need to -- that's got the authoritative signature on this deal and they're going to have the most influence on this because they're asking for an increased airspace in the whole complex, and so they're very important in this.

NP-4

2083 (cont'd) Page 36

And when you make your comments, you want to make sure that -- make sure your local airports get in on this, too, if they haven't already. Have them send in a formal comment to Ms. DeVine in Virginia at Langley and let them know their feelings. NP-10

I have talked with one man at Lemmon who is -- I don't know if he's crop dusting or not, but he had his head bumped against a cockpit window one day by a plane going over the top of him. He said he didn't want to do that again. He manages the airport now.

But, you know, when they put this together, it went from a high school class to kind of a graduate course when you start looking at all the 1.0s and 3.3s and 6.6s. That's -- it's gone to a pretty tough class. And we need to -- but you need to keep looking at this if you're gonna have any effect on this and then keep your comments coming. NP-10

It takes a lot of time to do this. I've got pages full of notes and trying to decide what would have the most effect on this whole process. But as the government has all these agencies, even our elected congressional delegation is against us on this, at least the ones in South Dakota. They in fact recommended this expansion. And they won't

2083 (cont'd) Page 37

admit, of course, that -- their offering up of our barren lands out here in low population. They offered that up in order not to have some of these Bases closed when the pressure was on.

I find it hard to believe that an Air Force now that flies intercontinental missions around the world gives us one of the reasons for expansion is that they want to stay close to home and save on fuel. That's one of their -- that's one of their reasons. They may not put it number one, but it's one of them. PN-2

So I'm not ready to sacrifice more freedom in order to have somebody tell me, "Oh, well, we're doing this for your safety and this war on terror." PN-3

At some point we have to say enough encroachment and decide that if we can't get our elected officials to represent us, then -- then, you know, we've gone way over the cliff. I hope we haven't gone that far yet. NP-2

But we all have the right to the pursuit of happiness and tranquility. The Air Force and the Environmental Protection Agency can't tell me that the time I spend up in the hills and buttes with my kids and family and grand kids is any less important than the concessions they're going to make to the LU-1 LU-3

2083 (cont'd) Page 38

Tribes as far as avoiding their cultural and religious and what have you exercises.

And I have nothing against the Tribes. But if you go through this appendix, you'll see the letters that started out in February of '08 by the Commander at Ellsworth, and I don't think he's there any more, but he sent letters to at least the first -- the four main Tribes that would be involved with this expansion and the increase in the flights, and didn't get a very good response from Tribal representatives.

CU-3

NP-10

So there was another letter that was sent. This one come from Air Combat Command at Langley to the Tribal representatives, no longer just the Tribal President, but the Tribal representative, probably a lawyer.

Time went by. The next letter shows a letter from Langley, Air Combat Command, to Bureau of Indian Affairs, you know. "Let's -- come on. Let's get these Tribes moving. We need -- by law, we need them here to come to a scoping meeting." This was in '08 yet. "We need them to come to the scoping meeting so we can do our community outreach," you know. "And, by the way, we're going to have chaff and flares now along with these low-level flights."

2083 (cont'd) Page 39

You don't have to draw a picture to think about what the Tribes thought -- would think of those letters, asking them to come in respectfully for -- for some meetings, you know, some powwow with the government. I know what they thought of that and I know what I think of it. NP-10

So I don't have any questions when I get to these things. I just have comments. And my only answer to the whole deal, as it was to my elected officials, was no. No, we don't want this. Enough is enough. And some day these bombers are going to be obsolete anyway. They're already flying these drones around and doing all the damage they can do with those. GE-2

But -- but anyway, you just have to remember that the only reason most of you are here tonight and the reason I am here, besides family, is the property rights. If you don't have some skin in the game, if you're not worried about some hunter leaving the gate open and traipsing across your butte and your hills and your valleys, you don't -- you wouldn't put up those signs. And if you weren't property owners, you wouldn't have come to this meeting tonight. You would be doing something else.

So we gotta remember, it's still a property

2083 (cont'd) Page 40

issue. And the needs of the Air Force are as they may be, but we just have to learn when we can say no.

As one guy said at the Bowman meeting, I didn't attend it, but I heard it quote, he said, "Go ahead and fly your flights 18,000 feet, and anything underneath that, leave us alone. Stick to your 18,000 feet."

And, of course, in the meantime, if you read this Draft Statement, they're going to have more threat emitters. They're looking for sites to put more threat emitters up and -- so they probably won't have any trouble finding those. CM-2

Well, I don't know. How much time do I have?

MS. MOYER-DURHAM: You're already at eight.

MR. DRAYTON: Okay.

HEARING OFFICER GREGORY: Let me see if anybody else has changed their mind. I only have one card up here. Did anybody else fill out a card that I don't have? Anyone? All right. Well, if you change your mind, let us know so --

MR. DRAYTON: I just have a couple sentences to comment on --

HEARING OFFICER GREGORY: Go ahead.

MR. DRAYTON: -- and then you can go home.

2083 (cont'd) Page 41

HEARING OFFICER GREGORY: We'll put another three on the clock for you. Go ahead.

MR. DRAYTON: At the bottom of the letter that -- the Northern Cheyenne Tribe, after the time had expired for them to send comments to Ms. DeVine, she sent a letter to the Air Force -- and possibly Ms. DeVine's office, I forget, it's in there, and she said, "The Tribe's been looking over your proposals and your scoping meetings. I believe we have the week of August 11th open," which was past the Air Force time. But anyway, "If you're interested, we'd be willing to talk to you at that time."

And at the bottom, I'm going to give you a contrast, at the bottom of the Northern Cheyenne letter it says, "Little Wolf and Morning Star: Out of defeat and exile they led us back to Montana and won our Cheyenne homeland that we will keep forever." And so I contrast that with the bottom of all these Air Force letters that simply says "Global Power For America."

HEARING OFFICER GREGORY: Sir, did you want to make that photograph a written exhibit with a copy? You can if you'd like.

MR. DRAYTON: Well, sure.

HEARING OFFICER GREGORY: Okay. I'll get your frame back.

All right. Anyone else? Anyone else? Well, we've obviously got quite a bit of time left before 8 o'clock.

So what I'm going to do is, I'll just wrap it up at this point with some concluding remarks and then I'm going to recess the hearing. And Teresa and I will be here. If anybody changes their mind and wants to make a comment for the record, just come up here. All you have to do is let me know. What I'll do is reopen the hearing so we have the machine on and you can make your comment if you'd like to do that. And I'll be up here until 8:00 if anybody changes their mind.

But at this point, in case I don't talk to you again, I want to thank you for coming out tonight and showing your interest in this proposal.

As I've mentioned several times, tonight's not the end of your opportunity to participate in this process. Those written comment sheets are over there. I think they're on that table to my left, to your right. You can turn these in at that table tonight or you can mail or fax them later. The mailing address is printed on the brochure and on

the comment sheets.

As I mentioned, the Air Force takes comments in writing at any time during the Environmental Impact Analysis Process, but to receive timely consideration for the Final EIS, all comments must be submitted by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter or postcard asking for your own copy and the Air Force will send copies of the Final EIS to you.

So at this point, unless and until I have someone else that wants to speak, I'm going to recess the hearing. And as I mentioned earlier, the Air Force and FAA reps will still be available during this time by these various posters and things to discuss anything you'd like to discuss with them. So we'll recess now.

(The hearing recessed at 6:53 p.m.)

HEARING OFFICER GREGORY: The hearing is called to order. It is 8 o'clock. During the recess we had no further speakers, so this hearing is adjourned.

(The Powder River Training Complex Hearing adjourned at 8:00 p.m.)

My Commission Expires: 4-29-2016

available out by those display boards to continue discussing things with you.

And with that, I'll move to the cards and call our first speaker. Mr. Frank Stoltz. Mr. Stoltz. And, sir, if you'd like, you can use this mike and this podium. It might help you if you've got materials there. 2084

MR. STOLTZ: Hello. I'm Frank Stoltz. I'm a World War II veteran, Air Force, and participated in the D-Day invasion and also hit Berlin and then we got shot down.

What I'm trying to say is, you know, during the war and all those things, what I fought for and I -- all these things are starting to happen, that I don't think that it's quite right what's happening, and I don't think this is what I fought for. Because virtually I think they're taking part of our freedom away from us on restricted flights and so on.

And I still fly, not as much as I used to, but I'm retired. Like they say, you have a 500-foot space. Well, fine and dandy, but some radio towers any more, they're that high. So if I just want to go out and tootle around a little bit and it's right in our back door, well, flying at 500 feet SA-24

2084 (cont'd) Page 36

doesn't -- doesn't do it, doesn't cut the mustard because there's too many towers around any more. It's a bigger hazard than what this MOA is. SA-24

I'm gonna -- I'm gonna comment a little bit on -- as far as the safety of all these things. It's been some years ago now. A little private airplane went down during the -- over at the Missouri breaks and I was called for a search, search and rescue, and so I was flying a grid. It was assigned to me by the Montana Aeronautics Commission. I was flying this grid. It was getting towards evening and I was at low altitude along the Missouri River breaks and I happened to look forward and, wham, there's a B-1B just shot right in front of my nose heading south towards -- towards Rapid City. SA-1

Like the heat flares you're talking about, well, let's say -- let's start with chaff. Well, we used chaff during the war, World War II. Of course, it was different than it now is, I guess. And you can still go over to Germany and still find it, still find some chaff. SA-27

As far as flares, if I would be flying around in the country and they're shooting off flares in the altitude, are these flares coming down as metal? SA-26

Powder River - Miles City - 1 10/15/2010

2084 (cont'd) Page 37

Am I gonna hit that? Are they gonna wreck my engine and am I gonna crash land, or what? SA-26

As far as flying the corridors, of course the way I fly, I might be over here looking at this, I might be over looking at that, and so there's my restriction about flying the corridor.

That's all I got to say, I guess.

HEARING OFFICER GREGORY: Thanks for your comments and thanks for your World War II service.

The next card I have is Mr. John Baldwin. Mr. Baldwin.

MR. BALDWIN: Yes, I'm John Baldwin, 2085 B-A-L-D-W-I-N.

Beginning in 1949, I began a spraying operation in this area and I concluded the spraying operation two years ago, the commercial operation.

But during that time what we referred to was the oil burner routes that were running over this area. And on two different occasions I had very near misses with military airplanes. SA-7

One was a B-52 bomber approximately 30 miles or 35 miles approximately northeast of here over the Fallon area, Fallon, Montana. The other occasion was south of Plevna, Montana, which is about 70 miles east of here. On that occasion it was with

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2085 (cont'd) Page 38

a little fighter air-type aircraft. I don't know exactly what it was. It happened quickly and I know it had a twin tail configuration on that airplane.

But there was no consequence other than I did get a call from Helena FAA about the incident at Plevna. They -- they op -- or whoever it was talking to me at that time said it was the Air Force that reported a near miss with a B-1, which I don't think was correct.

But at any rate, these military flights down near the ground are definitely a hazard to sprayers. Crop dusters are in the area in the early morning, mainly when the air is calm, and that's when the vortex from these big airplanes are certainly most severe.

SA-7

The occasion I had with the near miss with the B-52 was, like I said, northeast of here near Fallon, Montana. I had sprayed that morning and had emptied my load and started home and noticed that I was low on fuel, so I turned back towards our landing area, climbed up a little bit in case the fan quit before I got there, and I had a little time to look for a landing spot. And I was more concerned with the fuel gauges than I was looking around for B-52s, but one flew in front of me. I'm

Powder River - Miles City - 1 10/15/2010

2085 (cont'd) Page 39

certain it was less than three wing spans of the B-52. I was slightly higher than it was so I didn't get into the vortex of it, which was lucky, because I think if I had have done that, I probably would not be here talking today. But I know it is probably unlikely that there be any mid-airs, but it certainly could occur. SA-1

At that time my concern was not getting any information when the planes were going to be in the area where we were working. All I could get was whether the route was active or not. That was the long route beginning in California and I don't know exactly where it came, but it came up through into the Dakotas and back across our area, made a U-turn over the Powder River which is about seven miles west of our ranch, and then it turned -- they turned back towards Rapid City and flew within about a -- well, most the time within one or two miles of our ranch house. AM-12

Noise was a concern, although I'm not complaining about the noise. The sonic boom would be a problem, although we didn't have much of that. There wasn't much high-speed operation there. NO-5

The thing I haven't heard anything about would be any compensation for damage to fences, livestock, SO-13

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2085 (cont'd) Page 40

personnel that would be concerned over the noise. I don't know if there would be such a thing as having a tax credit possibly for ranchers or whoever may be operating in the area. It's a suggestion that I would like to have considered. I think that's about all I have for comment today. SO-13

HEARING OFFICER GREGORY: All right. Thank you, sir.

Next I have Mr. Tom Lane. Mr. Lane.

2086

MR. LANE: My name is Tom Lane. We have a ranch about halfway between Ismay and Ekalaka. It's not the --

(Brief interruption.)

MR. LANE: Like I said -- can you hear me now? Like I say, we've got a ranch that's out there about halfway between Ismay and Ekalaka. It's not the Garden of Eden, but it grows enough grass and hay to support our livestock and some wildlife and bird life, so it's not as desolate an area as some describe it.

We had testimony here a couple years ago from a rancher that come up here from Nevada that testified on the same thing here. He was talking about his conception rate in one of those MOAs down there went down 40 percent. And, you know, we can't stand SO-13

Powder River - Miles City - 1 10/15/2010

2086 (cont'd) Page 41

that. We're having enough tough time the way it is. And how will it affect the wildlife and the bird life here? Nobody knows.

Like I say, we're having a tough enough time making this ranch work without harassment from low-flying aircraft. We don't enjoy the benefits of the big banks industries and their salaries and we don't have a government job that ensures us of some income. We're out here really naked making it on our own.

You have fought a war with Iraq. Now you're fighting a war over in Afghanistan and Pakistan. And I'm not sure we're going to win any of them. We can't go into a country like we used to and bomb the hell out of them and bomb them into submission. We don't fight that way now. And we haven't won a guerilla warfare that I know of and probably won't as experience has told us in the last three big confrontations. We don't know how to fight that way.

We were told in Eisenhower's Administration to be aware of the military complex. It's using up a terrible lot of our money.

We were told this morning that our government right now has already spent $1 trillion 300 billion

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2086 (cont'd) Page 42

more this year that it's taken in. We have record unemployment. We have people on food stamps, on welfare, and we have unfunded education to do the right job for our kids, and our infrastructure is falling apart. We are in trying times. We're going to have to get along with what we have as ranchers as well as the people that live in this area. SO-14

And so we ask ourselves, why can't the military do the same thing. You already have thousands and thousands of acres of Military Operation Areas. Make do with what you have and please leave us out.

Let's try making peace around the world instead of war that's killing thousands of people, including our own young men, and creating so much destruction. May God be with us. PN-2

HEARING OFFICER GREGORY: That's all the white cards that I have. Did anybody fill one out whose name I did not call? Anybody change your mind about wanting to say anything or would like a white card? One in the back there, Brad.

I tell you what, sir. You can just come on up and we'll deal with the card up here. All it does is just have your name on it anyway. Go ahead and state your name for her and we'll do the card later.

MR. RAPER: My name is Bob Raper, R-A-P-E-R. I

run a hot air balloon operation here in Miles City. Your document may not have accounted for aircraft such as mine, nor I believe has it accounted for unregistered aircraft such as paragliders, ultralights, and other small aircraft that are generally used in this area. AM-19

I -- it isn't that I have any objection to the presence of the MOA. What probably would concern me greater would be how much warning we would get on the activation of the MOA. For the 10 days or so that's being proposed, it's probably not much of an impact unless I planned something in a remote location. AM-12

I'm the only operation in eastern Montana. And the MOA, I can be -- I can have my operation anywhere in the area that you have proposed. As such, the warning would probably be of a greater concern to me than anything else.

Outside of that, I certainly support your efforts. Thank you. GE-1

HEARING OFFICER GREGORY: Anyone else? We'll get your card later, too.

CAPTAIN REYNOLDS: Good afternoon. I'm Captain Sidney B. Reynolds, retired U.S. Army.

I have had experience with the Air Force, four

years in the Air Force, and then 24 years in the Army.

One thing I would like to say, I recognize the problems that these people are having. I recognize the problems that the civilian population has with putting up with the military. My comment is, that this country, this military, is defending us. It's doing a job for us. And so we do need to put up with a little bit of inconvenience. A lot, maybe not, but a little bit. GE-9

And in the Army sense of it, I ran into things. Like we had to deploy with tanks. We trained with tanks. And we had environmentalists and people come in and jump all over us because we left tank tracks out in a gravel pit. We had things like this that just really didn't make any sense and made our jobs about ten times harder.

And so I would like to say with this, I'm kind of new to this proposal, but at the same time the military people need to have their right, they need to have their place to go, and they darn sure need to have a place to train their people. You don't win a modern war or even a modern peace without spending quite a considerable amount of time doing your training. GE-9

You have to take your young people and you have to train them up and you have to take -- the skill level now is so high in the Air Force and in the military, that they just need the training space. GE-9

So I would say, what I ask of you, is that you understand, realize, and realize that we do have to pay a price for what we get. And it may not always be real nice, but it still needs to be done. Thank you.

HEARING OFFICER GREGORY: Anyone else? Is there anyone who already spoke that would like to add to what you said earlier? Well, as I mentioned, this isn't set to end until about 3:30, so I think that's about an hour from now.

What I'm going to do at this point is give you some concluding remarks and then I'm going to recess the hearing, but Teresa and I will still be over there. If you change your mind and want to make a public comment, then I'll open the hearing back up, we'll turn on the court reporting machine, and we'll get your comment taken down for the record.

Thanks for coming out this afternoon and showing your interest in this Powder River Training Complex EIS proposal. As I've mentioned several times, this afternoon is not the end of your

opportunity to participate in this process. Again, written comment sheets are available at the registration table. You can turn these in this afternoon or you can mail or fax them later. The mailing address is printed on the brochure and on the comment sheet.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process, but let me foot stomp this. To receive timely consideration of your comment, please have that in by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter or postcard asking for your own copy and the Air Force will send a copy of the Final EIS to you.

At this time I'm going to go ahead and recess the hearing. And again, if you change your mind about making a comment here this afternoon, I'll be sitting up there at the table along with Teresa and we'll get your comment down on the record. So again, thanks for coming.

(The hearing in recess at 2:32 p.m.)

HEARING OFFICER GREGORY: The hearing is called to order. The time is 3:30. During the recess we

had no one who wished to make a public comment here, so I'm going to adjourn the hearing.

(The Powder River Training Complex Public Hearing adjourned at 3:30 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the forgoing Pages 1 through 47 are a true and correct transcription of my stenographic notes.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

My Commission Expires: 4-29-2016

included in the Final EIS.

Just a few reminders before we get started here. First, please limit your comments to the Draft EIS. That's the subject of this public comment period. Second, if you agree with a previous speaker on something, you can certainly say that, but you don't need to use up your time repeating it since it's already in the record. And finally, as I mentioned earlier, this formal part is not a Q and A session. It's an opportunity for you to put on the record your views and your concerns about the proposal that you want the decision-makers to consider. Questions that you pose during your comments will become a part of the record and will be considered.

After we're done with the formal part of this, the FAA and Air Force reps will continue to be available out by all those display boards that you see in the hallway to discuss things with you.

Did you have another speaker card? Okay. All right. Thanks.

And with that, I'll call the first speaker. I have, just dealing off the top here, Patrick Lifto. Mr. Lifto.

2089

MR. LIFTO: My name is Patrick Lifto with the

2089 (cont'd) Page 35

Montana Pilots Association. That's L-I-F-T-O.

I guess one of the questions -- I've just got basically questions. The corridor, I'm wondering on these corridors, if they're going to be open 24 hours a day at any altitude for VFR and IFR and if you have to get permission to go through them. AM-20

And another question I've got is, can the Air Force, when they're flying, can they electronically see another aircraft in the area. AM-8

I guess that's all I had.

HEARING OFFICER GREGORY: Okay. And again, after this formal comment part, some of the FAA and Air Force reps may be able to help clarify some of those things for you, but those are included in the record for them to consider.

Next I have Mr. Lee Richardson. Mr. Richardson.

2090

MR. RICHARDSON: My name is Lee Richardson, R-I-C-H-A-R-D-S-O-N. I'm here for the Miles City Hangar of the Montana Pilots Association, and we would like to go on record as being in opposition of the expansion of the Powder River Training area. So I guess we would then be in support of the No-Alternative Action. GE-2

We have a number of reasons. I'm not going to

put those into the oral part because I did submit a written proposal that has that in there so there's no use repeating everything with that.

I also represent the Miles City Airport. I'm the Chairman of the Miles City Airport Commission, and the Miles City Airport Commission is also in opposition to the expansion of the training area simply for the fact that we think it will reduce revenue that is generated at the airport due to the lower level of pilots that would be flying through the area. Thank you. SO-10

HEARING OFFICER GREGORY: Sir, did you say that you had already submitted that in writing? If you have anything else tonight, you can leave it here as well.

All right. Next I have Mr. Bill Lane. I thought I recognized you. Here you go. You're ready to go.

2091

MR. LANE: I'm Bill Lane, L-A-N-E. I'm a cattle rancher southwest of Baker as well as a private pilot and aircraft owner. I made comments the other night in Baker.

But one of the issues that, in visiting tonight with several of the representatives, was that where we live, we are in a black hole for radar AM-1

2091 (cont'd) Page 37

communications as well as radio communications. We have no way of being able to contact Air Traffic Control to see if a new or a different part of the MOA has been activated. AM-1

They say they have two hours to activate it. However, if I've been up in the air for an hour and at the time I went up I actually checked the NOTEMS and it indicated that it had not been open, I could be up in the air and all of a sudden this other area could become hot, and that creates a safety concern. AM-12

But I think it's important for everybody to know, too, I'll now put on my rancher hat and indicate that we -- they say that there's no effect on our property values. We know that's not the case. Any time -- I'll use the analogy of owning property underneath the flight path of aircraft landing at a major airport. Guarantee those property values are lower than those outside of that flight zone. SO-1

But we run the risk of having our cattle break through fences. We have examples of conception rates falling upwards of 42 percent on our cattle. For a lot of ranchers, that could result in hundreds of thousands of dollars lost. SO-13

But like I say, the main thing is our safety, SA-7

and I think that there's a lot of safety issues that need to be cleared up before we can go any further. SA-7

And the main thing is, should this go through, we need to have better communications with Air Traffic Control before any of this can happen and happen safely. AM-1

But I think it's important that we also realize what -- the effects of our livestock, our livelihood. You know, I used the analogy before where the Air Force is out there to protect our interests worldwide, while we have to be here to protect our interests locally. SO-1

Let me go on record as stating that I am for the No-Action Alternative. Thank you. GE-2

HEARING OFFICER GREGORY: Mr. Krutzfeldt.

2092

MR. KRUTZFELDT: Lewis Krutzfeldt, K-R-U-T-Z-F-E-L-D-T. I want to go on the record as being opposed to any of the actions. I would -- I guess I would be for the No-Action. GE-2

I'd like to say that we live in the current MOA area, and the flight noise level right now is enough. We are a dumping ground for noise pollution, and they want to increase that to more noise pollution and add flares and chaff to it, and basically we would become a dumping ground for the NO-5 PN-2

2092 (cont'd) Page 39

Air Force, where they already have somewhere they can train and it just is an inconvenience for them to get there to do it. PN-2

I have no problem with the area increasing so other people can enjoy that noise level that we get to enjoy, but we don't need any more as far as sonic booms or plastic garbage or fire hazards. I just -- SA-5 I'm opposed to it totally. Thank you. NO-5

HEARING OFFICER GREGORY: All right. Thanks for your comments. Is that another card? Okay. Mr. Larson.

2093

MR. JACK LARSON: There are -- a number of people who live in the area where this is going to impact are former students. So, Lewis, I appreciate you being here speaking on behalf of this thing.

I'm for the No-Action Alternative for several reasons. It seems like we've become a target. Good Lord, we were told I don't know how many times there would be no action on the Missouri River breaks. There's action. It's a monument. We've now been told there's going to be no action in northeastern Montana. I'm going to wake up some morning and hear that on the news, that there's going to a national monument up there. I know it. And it seems like now we'll be ducking every time we turn around as GE-2 CU-2

Powder River - Miles City - 2 10/15/2010

2093 (cont'd) Page 40

something comes flying over the tops of our heads down there.

I was requested to come in here and speak for just a moment concerning this by some people outside of Powderville who -- I've been out on the ranch when I've had to duck because I thought we were getting bombed. It seems like some horses spook pretty good when you've got something like that coming over the top of you. BI-4

I just think that this is an action we tough people of southeastern Montana just don't need to put up with. That's all there is to it. GE-2

I appreciate the military, the things that they do. The action that we have now, Lewis, I think you guys have learned to put up with that part of it, but I certainly don't think it needs to be increased.

HEARING OFFICER GREGORY: All right. Thank you, sir. Anyone else? Is there anybody who's already spoken who would like to add to what you've already said? Anyone? Come on up. 2091 (part II)

MR. LANE: Once again, I'm Bill Lane, L-A-N-E. One thing, this might not help them, but just to let you guys know, this isn't scientific fact, but they are concerned with the fact that the chaff from SO-16

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2091 (part II cont'd) 10/15/2010

the -- or the filaments from the chaff could contaminate the wool of anybody who's raising sheep which would basically make it invaluable.

SO-16

And I think it's important for everybody to realize that there's a lot of effects that we're not aware of and I think they need to be researched in detail before this goes any further. Thank you.

GE-11

HEARING OFFICER GREGORY: Anyone else?

MR. KRUTZFELDT: Lewis Krutzfeldt, K-R-U-T-Z-F-E-L-D-T.

2092 (part II)

I would like to add to my comments that they have not addressed the conception rates or the economic loss that could be felt from the ranchers living in the area because of the increased noise levels and the sonic booms. And the economic -- or the environmental impact of the chaff and flares I don't think has been adequately addressed for our area. And I feel that there's a lot left unanswered that needs to be addressed before they continue with this. Thank you.

BI-2

SO-1

SA-27

GE-2

HEARING OFFICER GREGORY: Thank you. Anybody else? Well, we're still not -- it's just shy of 7:00 p.m. and this hearing is scheduled to go to 8:00. So if you change your mind, we'll still be up here.

But at this point I have no remaining speakers. The Air Force and FAA reps will continue to be available out there by those display boards to continue discussing things with you.

I want to thank you for coming out tonight to this Powder River Training Complex EIS proposal. And as I've said a couple times, tonight's certainly not the end of your opportunity to participate in this process. Those written comment sheets are available at the registration table, and you can turn those in tonight at that table or you can mail or fax them later. The mailing address is printed on both the brochure and the written comment sheets.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process, but let me foot stomp this. To receive timely consideration for your comments to go into the Final EIS, your comments must be received by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the table back there or send a letter or postcard asking for your own copy and the Air Force will send copies of the Final EIS to you.

We've got a little over an hour to go until I'm

going to adjourn the hearing at 8:00 p.m. At this point I'm going to recess it, but Teresa and I will remain up here, and if you change your mind about making a statement or you would like to add something to what you've already said, all you have to do is come let me know, I'll open up the hearing again and turn the machine on, and you can make a public comment for the record.

Since there's no more speakers at this time, I'm going to recess the hearing. Thanks again.

(The hearing recessed at 6:54 p.m.)

HEARING OFFICER GREGORY: The hearing is called to order. During the recess we had no additional speakers. The time is 8 o'clock. The hearing is a adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)

And then after we're done with the formal part of this, the FAA and Air Force reps will continue to be available by all those display boards and various things to continue discussing things with you.

And with that, I'll grab our cards here. I'll just deal off the top of the deck. Mr. Wade Bergslin. Mr. Bergslin. 2094

MR. BERGSLIN: Hi. I'm Wade Bergslin, a pilot with True Oil Company in Casper.

First off, let's say that I'm a proponent of the military and a former member of a combat flight training unit within the Air Force, so I do see a need for changes, both the offensive and defensive training needs based on your summary of your factors, but I have to go on record saying that this GE-9

Powder River - Gillette 10/18/2010

2094 (cont'd) Page 35

proposed land/air grab is excessive in size and scope and requires additional review before implementation. AM-6

The needs of the Air Force and the benefits that it forecasts to facilitate all these components involved via an increase in the area to the proposed PRTC, they're understandable, but yet contrary to the effects to operators like my company and others within the energy industry, they're negative. GE-11

The efforts that go into this statement only assume the operations of those who are within the proposed area and for those who reside along the border of the Training Complex. The only non-residing public users defined by the EIS are the Part 121 air carriers who in some areas are providing service under the essential Air Service Act, which kinda gets skewed around, and those carriers who will overflight. So I must disagree with your fact-findings and estimates of operators transitioning through and sharing this space. AM-19

In our case, we're located in Casper which is a distinct hub for various facets of the oil and gas industry, and now with increased activity within the Bakken fields of North Dakota and other areas located within eastern Montana and North Dakota, SO-7

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

Powder River - Gillette 10/18/2010

2094 (cont'd) Page 36

there's a visible increase in corporate air traffic actually from Houston on up, which is not really the periphery of this area. SO-7

On a geographical scale, in relation to the proposed area we're about 100 miles south and as the azimuth reflects for our headings, we would be impacted by an approximation of 75 degrees of heading for over 350 miles. And we operate into areas within and on opposite sides of the proposed airspace. So three-mile rings around areas within the proposed area make for chop-and-drop for high-performance airplanes, and really that's not very safe. SA-7

The energy industry is pretty huge within these states and has needs of its own just as you do. And corporate airplanes are important to facilitate the companies. Bottom line, the streamlining our operations through the effective use of our aircraft means reduced time and man-hours for those within our companies who depend upon our services. SO-7

Just as you can state your case and justify your savings and proposed benefits, we as an integral part of the commerce of this area and nation also find savings within this airspace. Failure in being able to share this airspace is a

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2094 (cont'd) Page 37

loss of time, manpower, and fuel, and that can't be denied.

We employ over 1,000 families, or the paycheck to over 1,000 families throughout the region, so I think that's a pretty significant economical impact.

Personally, I have no doubt that the PRTC will come together, but being harmonious to the civilian sector with whom you will share this airspace is paramount, and the agencies involved are being entrusted with the requirement for good stewardship, which is very, very important.

The Air Force as the proponent and the FAA as the cooperating agency are going to need to be working on the same page. There are three centers involved: Salt Lake City, Denver, Minneapolis, and the two command structures: Minot and Ellsworth.

From my previous experience with over 11,000 hours of flight time, I have no qualms in saying that the effective use of ATCAAs and MOAs is and will be an issue.

For example, coordination is usually pretty poor. The hot times will be extended. Communications between the Air Force and FAA will be breached, and eventually an increase in usage will be a factor as units from around the country will

SO-7

SO-6

NP-4

AM-27

2094 (cont'd) Page 38

want to come play in the new playground. This will have an impact on us and others.

I feel that as the public, we are being told to move out of the way, and any adversity to the movement would be negligible in nature and the proposal shall move along as forecasted. Well, that shouldn't be the case. We need to be at the table, too.

And I very respectively request that before we make this a done deal, let's at least consider the needs and hopefully provide some provisions for those whom fly within and adjacent to the airspace.

It's time. Thank you.

HEARING OFFICER GREGORY: All right. Thanks for your comments and thanks for your service as well.

MR. BERGSLIN: Yes.

HEARING OFFICER GREGORY: Let's see. Next I have Mr. John Campbell. Mr. Campbell.

2095

MR. CAMPBELL: Thank you very much. I appreciate the Air Force sharing this with us. I really do. I'm right at home up here.

My name is John Campbell. I'm a chief pilot for True Oil Company. And, you know, this -- I'm a Republican. I'm a veteran. I understand, you know.

AM-27

GE-11

2095 (cont'd) Page 39

You know, when I work -- I work for an oil company. We're very, very important as security, too. That's what World Wars are fought over is oil And we're all very patriotic, but man, this is breaking our backs. This is not good. And so I've got a list of stuff here just to keep on the subject.

When we take a load of people someplace like up to Minot or Bismarck or something, we usually spend a whole lot of money on the other end to finish wells or go to schools. We just sent a couple pipeline guys to some environmental schools in Bismarck.

Just in the last three weeks we've transited this airspace two round trips to Bismarck, two round trips to Watford City, North Dakota, Williston, Minot, and Dickinson. And we go up in that country at least two round trips a week, and a lot of times we stop here in Gillette and pick people up.

To go around your airspace, the 200-mile trip which is one hour in a 340, 45 minutes in a King Air, will now become a 400-mile trip because the shortest way from Gillette to Dickinson is via Bismarck. That's not on the way.

A hundred miles, the weight of fuel to burn --

SO-7

2095 (cont'd) Page 40

to go a hundred miles is one passenger. That's 200 pounds. And I know you're a 340 pilot. You know what I'm talking about.

This is going to cost us a lot of money. And if we have to -- if we have people in the office scheduled to Work Over Rig and then we have to reschedule because the Air Force has the airspace tied up, that's going to tie up tens of thousands of dollars for us. A driller rig costs $100,000 a day and we're an integral part of that. I'm already getting off of subject. SO-7

All right. I would be interested in knowing how we get in and out of Baker, Montana, IFR, when the weather is IFR and the ATCAAs and the MOAs are active. We can't do it. Roger can't sell us gas. We can't deal with our pipeline company and he can't make a living. SA-3 SO-5

The published operating schedules are basically the same working hours we have. We're very familiar with the route around Belle Fourche, South Dakota, and Miles City, Montana, as it is. How do we get to Baker? I already said that. AM-21

There was one thing that was said in somebody's presentation here. IFR traffic is not allowed in an active MOA or an ATCAA. The FAA will not separate

2095 (cont'd) Page 41

us. So whoever told us tonight that they will, that's not correct. We cannot enter a MOA on an IFR flight plan. That's the problem. AM-21

Now, there's a lot of users that would be real interested in this process who don't know anything about it. Senator Enzi's office was disappointed in Wade because she is disappointed that nobody called them to tell them about this. We're not getting the word, you know. In fact, Wade and I found out about this by accident. Something's wrong with this picture. NP-8

Next item is that, if we know about this kind of airspace, we can avoid it right after takeoff and mitigate to a certain extent the existing MOA where it doesn't cost us a lot of money. The problem is, we talked to Mr. Rizzo, is that the Air Force and the Flight Service Station, between the two of them, we're not getting the information. ATCAAs do not work for us. Wade touched on that. We don't know. We can't be carrying extra fuel in case it's hot. AM-12

All right. We talked about -- the other destinations in North Dakota cost us an extra hundred miles. Dickinson costs us an extra 200 miles. That's a lot of money. SO-7

I don't believe the corridors will be open as AM-20

Powder River - Gillette 10/18/2010

2095 (cont'd) Page 42

much as they say. I think the Air Force and the FAA have a lot of work to do on that. AM-20

On -- Ms. DeVine, I think you were talking about some of these areas being not charted on these alternate deals you're talking about up here. Whatever you do, please chart everything. That's a problem with ATCAAs, is they are not charted. So whatever you decide to do, please chart everything so that we can plan around them. AM-22

All right. I'll bet $100 I've passed my three minutes.

HEARING OFFICER GREGORY: Well, we'll go ahead and run a slow clock.

MR. CAMPBELL: All right. Well, I appreciate it again, Air Force and FAA. I'm really glad you invited us to be a part of this. Thank you very much.

HEARING OFFICER GREGORY: Thanks. All right. Thank you. And thank you go for your service as well.

Let's see. Mr. Von Flatern. 2096

MR. VON FLATERN: Hi. My name is Michael Von Flatern. Today I'm up here on my own behalf, not as an elected official.

I have a small charter business and it operates

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

Powder River - Gillette 10/18/2010

2096 (cont'd) Page 43

quite a bit between here and North Dakota and eastern Montana. And the two gentlemen before me, of course, took a lot of my thunder out. They understood the additional cost. But let me give you a couple of quick numbers on what this may cost us.

It's about an hour to -- from here to Dickinson. It costs the customer about $800 to go one way. With this proposal, if I understand it, if it should be active, and I'm not saying it's going to be active all the time like they told us, but should it be active, it's about $1220. So that $800 went to $1220 and the flight went to an hour and a half. There's a lot of safety issues involved with being in the air for an extra half hour. SO-7 SA-25

Anybody coming distance, hopefully you can top the Military Operations Area. If you can't top it, you better have a lot of extra fuel on board because you're going to have to plan for an extra half hour to -- to almost another hour.

If you go to Sidney, right now we can go to Sidney in, oh, about an hour. It will take two hours. It will go from $912 to $1600 one way for that customer. Almost all our customers are round trips. You can just double that price. SO-7

So those are the additional costs. That's a

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2096 (cont'd) Page 44

local economic impact. SO-7

One of the problems that I'll have with this is that I'll get a phone call to quote a trip and it may be two weeks, four weeks, eight weeks out when they ask for the quote. It will be, you know, just before Christmas we want to run to Dickinson. I know it's not posted that they will be active December 22nd, so what do I bid? We bid hard nautical mile trips. We tell you exactly it's going to cost you $1600 round trip to Dickinson.

And then if we get this -- if this becomes active -- let me rephrase that. If the MOA is active that day and this new area is encompassed, it will be -- well, we'll be flying for nothing. In fact, we'll probably be paying our passengers a little bit of money. We'll actually lose money in the deal. That's your local economic impact. SO-7

Time loss of course I've mentioned. Commercial airlines, our commuters, our commuters now are doing a -- oh, I think it's a Miles City connection with Gillette. I've heard them on the radio out of Dickinson coming Gillette. They go Miles City, Cut Bank. All these -- if they get those gap areas you saw on your map, they'll be available to them, but... And they're still getting out of their way.

2096 (cont'd) Page 45

Now, are they going to cut Gillette out of that picture and go to Billings and then go over and service Miles City? We don't know. We don't know what they'll have to do to make up for the additional miles they'll have to fly.

Safety issues, additional time in the air, bad weather, forced to fly in the limited air. Have you ever been face-to-face with a level 3 or something and you say, "Well, I'll just deviate 50 to the north or 10 degrees off course for the next 20 miles." Well, if you're bouncing into the MOA and it's active which, you know, local thunderstorm, they shouldn't be active if they're IMC, we understand that, but a local thunderstorm will drive you there, you can't do that. You will have to turn further south as you're trying to get to North Dakota. That can be a real problem. SA-7

Talked about fuel requirements for those that are flying long distance to make sure they have enough. Coordination with ATC. We have a lot of customers in Colstrip. We have a lot of customers that have property and operations in Gillette that come out of Bismarck, one of them in a jet. SO-7 AM-1 SO-7

Their descent rate should really -- if they have to stay above 26,000, which means they're at AM-5

2096 (cont'd) Page 46

28,000 35 miles from Gillette, they get cleared to land in Gillette because they can't let them down before that moment, their descent rate is better than 2500 feet a minute, ah, not a big deal in a jet. Doesn't bother the jet. May bother the passengers a little bit. So there's something to consider.

It's only 35 nautical miles out from Gillette until you hit this MOA. I can't climb to 26,000 feet. On a really cold day, give me all day long, I'll get there, but in reality, jets don't get cleared above 10,000 feet here until they get contact on radar with Denver. They've got about 15 miles left, 20 miles left at this point. They've gotta get from 10,000 to 26,000 feet. That particular edge of the MOA is too close to Gillette. It needs to be further out.

AM-5

You've taken eastern Montana, minimally two of the new proposed areas would be in effect on eastern -- going eastern Montana out of Gillette. Three of the proposed areas will be in effect going to North Dakota, depends on where you're going there.

So Gillette has a lot of issues with -- or a lot of -- a close relationship with all the new oil

2096 (cont'd) Page 47

development and particularly the coal mining.

So those are direct routes. We need to fly. We're doing it every day. Casper is doing it a lot, either landing here or overflying us on their way up, and it's not something we need to block, slow down business, cost the passenger, cost the business money. So thanks for your time. SO-6

HEARING OFFICER GREGORY: All right. Thanks a lot, sir.

Next I have Ms. Cherril Kiper. Ms. Kiper.

2097

MS. KIPER: Hi. My name is Cherril Kiper. I am for the Air Force 100 percent. There is nothing like the Air Force. I back them all the way. GE-9

I am a 20-year Air Force wife. My husband worked on the B-52s for 20 years. And what has been said in your presentation about the B-1 and B-52 bombers is all true. They do need the extra airspace for their training, especially the B-52s because those things are awesome. They're huge. PN-1

I can't think of anything to say against but what these people have had to say. I have been pretty much involved as a wife with the Air Force. We've been -- we haven't been to that many Bases because it's not -- when we were in, there weren't that many Bases that would take the B-52s because

2097 (cont'd) Page 48

they are so big and so heavy. But you must know that -- we were in during the Vietnam War. And even now, if it wasn't for the Air Force and their bombers and their jets protecting our country, you may not be here now.

This expansion they want to do is very, very important. And I think maybe, what, 10 days at one time should not put that many people out of their field. You'd think -- I'd think you'd want them to maybe step back and let the planes come in and do their training. They need this extra airspace, especially for the kind of training they're going to be doing now. They need it very badly. PN-1

I can't say enough for the Air Force. I have been a Red Cross manager or director for the whole Base. I taught preschool when we were in Guam. The preschool was ran through the chapel in Guam. I have worked at the Animal Shelter as a treasurer. I've organized an NCO Wives' Club for our squadron.

There is security with the Air Force I have never had since we've been out. My first husband has died. I've remarried another great guy. He was a Marine for ten years. But I cannot talk enough about the Air Force. I will always back the Air Force in every way I can. Thank you.

HEARING OFFICER GREGORY: All right. Thank you, ma'am.

Next I have Mr. Jeff Carsrud. Mr. Carsrud.

MR. CARSRUD: Hi. My name is Jeff Carsrud. And I was actually born and raised here in Gillette, and actually was employed by a gentleman in the room here. And since then, about 15 years ago I decided to move to Rapid City and open a small business and it's been very successful. We've had a great economy to work within.

I'll spell my last name, too, for you. C-A-R-S-R-U-D.

2098

HEARING OFFICER GREGORY: Thanks.

MR. CARSRUD: And I come as a representative of the Ellsworth Task Force as a -- I get nervous -- as an Executive Officer and also as a Honorary Commander for the OSS which is the Operations Squadron there at Ellsworth Air Force Base. So -- and that's all, you know, that all -- those services are all things that I do for the community, no pay involved. Just I realize the importance of the Air Force Base and what it does for our region.

And it does stretch further than just Rapid City. It stretches further than Gillette. It stretches further than Sioux Falls. You never know

2098 (cont'd) Page 50

the impacts.

The approximate impact of Ellsworth Air Force Base is $278 million per year. Ellsworth Air Force Base is the largest employer in the Rapid City area. Ellsworth Air Force Base is the largest employer in the State of South Dakota. So it's very important to us. SO-24

This -- in 2005 they put Ellsworth Air Force Base on the BRAC, which is the closure list, and there was about 13 Bases that they were going to close, and we were really close to being on that final list, and I'm not so sure we weren't.

But we positioned ourselves and made some changes. We moved the runway. We moved the exit by the runway. We did some things, and a lot of those things that we did were able to save the Base.

Well, at that point we realized, you know what? We've gotta make ourselves more self-sufficient so that when this BRAC things comes up again, that we're not sweating again.

So this is one of those things that was created. We realized that the impact of being able to take our training -- because we already have -- you guys are here seeing this for the first time, and we've actually been operating a training

2098 (cont'd) Page 51

facility for I don't know how many years. It's been a long time. And -- and one of the questions that I first had because -- because going through this process you start hearing about, from the Pilots Association and those guys concerned about it, so I went and talked to a few pilots in my -- two pilot friends of mine and then one gentleman who does have a charter service, and I asked him, I says, "How come you guys are able to provide these services and -- with -- with -- with the existing training facility and how do you -- how are you able to make the flights to Montana and all the places you need to go?" And each one of them said, "It is not a problem. It takes planning. It is going to take a little bit more planning," but they just make some adjustments and plan around it. That's just what you -- that's one of those things you have to do. GE-11

This will take an area and make it three to four times larger. And if you can see in the overlay, going back to my patriotic side, if you see the overlay of the map they had up there, they showed Afghanistan and they showed the quadrants and where they were placed. Also, if you see, there's no coincidence that the features, the mountain features and the ground features are very, very PN-3

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2098 (cont'd) Page 52

similar to Afghanistan and here. There's a reason why they wanted to place this here and it is not just Ellsworth Air Force Base. It's the -- it's the Air Force. They feel that this is a very important thing to do. PN-3

So I stand in support of this Training Complex. And -- and for the defense of our country, there is a few things that we need to make adjustments for sometimes and this is one of those things. Thanks. GE-1

HEARING OFFICER GREGORY: All right. Thank you.

Next I have Ms. Linda Wegher. Ms. Wegher. 2099

MS. WEGHER: Hi. I'm here just as a citizen. I know nothing about flying. I do know a little bit about environment and health issues, and I'm concerned about the chaff that they're planning on using.

Yes, it's made of silica, but my understanding is that when they release the chaff from the planes, it becomes glass. So basically what happens, is you have tiny glass particles floating in the air and they're gonna drift towards the ground and they're a size that can become embedded in human's lungs, in their eyes, in an animal's lungs. SA-14

I'm not sure that there have been adequate

studies done that really substantiate that there is not a danger associated with this chaff. SA-14

I'm also concerned about the flares. There was an article in the Rapid City paper on October 3rd that talked about a huge fire from a mishap with a flare. We have a very arid atmosphere here. If it can happen in New Jersey, my guess is those flares burn faster because the concentrations of oxygen there may be a little bit more than they are here. So I'm also concerned that we may have fire dangers. SA-5

The startle effect from the noise, I grew up on a farm. I can guarantee you, animals can get spooked when there's loud noises. I've listened to lots of planes from a distance I'd rather be a little further from and they're extremely loud. They sound like sharp cracks of thunder constant as they're going past. That would disturb animals. It would disturb wildlife. And I personally hate to see any of our national treasure that we have in this area impacted by what's being proposed here. BI-4 LV-1

Having said that, I don't have a solution for the Air Force for their training needs. But thank you.

HEARING OFFICER GREGORY: All right. Thank you.

2100

Next I have Mr. Tom Lubnau. Mr. Lubnau.

MR. LUBNAU: Thank you. And I guess I'm speaking in my official capacity as a State Representative for the State of Wyoming in sharing concerns that my constituents have shared with me and asked me to share with you.

They all support the military. They support your mission. They support your operations. And the State of Wyoming does, too, and has put their money where their mouth is in expanding Camp Guernsey which is probably the only expanding Military Base in the United States right now, even building a new airport to accommodate military traffic there in Guernsey. GE-9

But here are the questions that they ask and the concerns that they would like to share. The first one is, how many Military Operations in the United States are enough. They show me the ones in Utah, Idaho, and Nevada, California, and Washington and ask why those won't work and why we need to expand here. PN-2

Let me take off my legislator hat and put on my firefighter hat. The fire danger here is a little different because our fuel type is different than just about anywhere in the nation. We're driven by SA-6

one-hour fuels, where the fuels can dry out in an hour and carry a fire. And so the National Fire Danger Rating System may be based on 10- or 100- or a 1,000-hour fuels doesn't apply. SA-6

Our fire season runs from March to June and from about July 1st until the first snow. The biggest fire in recent memory in this county was the day we burned up 60,000 acres in 2000 on Halloween because of a small spark from a transformer on a power line out by Joel's farm.

Did that get near you? Halloween fire?

AN AUDIENCE MEMBER: About 50 percent of it.

MR. LUBNAU: Okay. So when you talk about fire danger and restriction for fires, you're looking, if you're honest about it, from March to June and July until the first snow, which is generally mid to late October. SA-6

The next thing is, and it's a cultural thing here, we've heard lots of people from the federal government come here and make us lots and lots of promises, and not necessarily the military, but lots of other agencies. And what we find generally is that the promises made today are ignored tomorrow. GE-5

And I read the Environmental Impact Statement and I'm not a scientist by trade, but we have a huge

problem with the sage-grouse. And I don't think that your Environmental Impact Statement addressed the concerns that we have with listing the sage-grouse. We have periods of time where people are out of work. And sage-grouse are by nature necessarily stupid, and we don't know all of the effects on behavior that the sage-grouse has, but if you caused that sage-grouse to be listed, you will be putting tens of thousands of people in this state out of work.

BI-3

SO-27

One request that I would have is that, if you do publish on the website, that you do so in plain language and well in advance of any operations so that we can plan and plan around it.

AM-12

And, you know, I grew up in this area. Wil did. Joel did. There's a lot of us here. Steve did. And in the '60s we had supersonic flyovers, and our parents and our grandparents fought it then and got it stopped. And you can say that there's no structural damage, and I guess it doesn't knock nails apart and doesn't knock 2 by 4s apart, but, you know, from my own experience, I've seen cracked dry wall and cracked paint, and nobody from the Air Force was willing to fix the cracks in my parents' home growing up.

SO-18

2100 (cont'd) Page 57

And then finally, the last bit of concern that my constituents shared with me is that it's easy to make promises, and that after you make the promises, you'll all be long gone in a couple years and we'll all still be here. And I don't want to have to say that you weren't candid with me, but I anticipate it because the rules change, the times change, the areas get expanded, the times get expanded, things get easier and easier to close as less and less powerful people have less and less input about things. GE-5

And so those are the concerns that my constituents wanted me to share, and I appreciate you giving me more than three minutes to share them.

HEARING OFFICER GREGORY: Well, we run a tight clock. It might be a little slow at times.

That's all the cards that I have. Have I missed anybody who filled out a card that wanted to say something? Anyone? Okay. Is there anybody who already spoke who would like to add to what they've already said? If you do, we'll put some more time on. Come on up.

2095 (part II)

MR. CAMPBELL: John Campbell. Off the record. I want everybody to know that Wade owes me a beer.

My suspicions are confirmed. The gentleman

2095 (part II cont'd)

Powder River - Gillette 10/18/2010

Page 58

back here did kinda show everybody's cards. This is an economic issue for Ellsworth Air Force Base and all those jobs. And -- and I thank you for not making me the first to say that I'm very, very skeptical of these promises. SO-24

I've dealt with the FAA in '88-1. I've dealt with closing Flight Service Stations and promising me, quote, a better service. I've dealt with closing FSDOs and GADOs, and those promises weren't kept.

And I gotta tell you, it looks to me, gentlemen, that what we're trying to do is we're trying to build a -- trying to think of a good word -- we're trying to build a facility to attract other commands to this area for training, much like Davis-Monthan is a training command for air attack and that sort of thing. Nellis Air Force Base. PN-2

And, you know, you guys are showing your cards tonight. What you're trying to do is create a place for other commands to come so you can sell more fuel, keep those jobs, and you're doing it at the expense of the people who are going to be here forever and ever and ever.

And I know you people are talking to us in good faith, but you guys are going to be gone and we're

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2095 (part II cont'd) 10/18/2010

still going to be here and we're still going to be flying clear around the world to get to Dickinson, North Dakota.

Talking about sonic booms, I grew up around horses north of Cheyenne. You know, I do pipeline patrol in helicopters and in airplanes, and when I see a man on a horse, I yank-and-bank because I don't want to be responsible for a horse throwing somebody and throwing his back out. SA-9

When I see people on backhoes and stuff while I'm flying low and fast, I get the hell away from them. That's not safe. I challenge a B-1 pilot to do that. I don't think he can do that. SA-1

So I guess I've probably worn out my welcome. I think I'll sit down. Thanks again.

HEARING OFFICER GREGORY: All right. Thanks. All right. Thanks, sir. Anyone else? Come on back up. Just state your last name again. 2099 (part II)

MS. WEGHER: It's Wegher. I failed to mention one thing that I know is going to at some point at least annoy all of us, and that is, any impacts on commercial flights.

We all know how fun it is to fly commercial these days anyway because the airlines can care less about us. So we're sitting out here at the Campbell

2099 (part II cont'd) 10/18/2010

Powder River - Gillette

Page 60

County Airport waiting for our flight and there's something that happens because of what's going on with this and there's disturbances to the communications I understand. The airlines aren't going to care that we have a problem. We're going to miss our flights. We're going to -- we're going to have all sorts of problems. And is the Air Force going to have some way of helping us with that? SO-10

I mean, I've heard of people that have missed conferences that they were supposed to speak at or to attend because they had flight problems and this is just routine stuff. And this is just going to add one more element of frustration.

HEARING OFFICER GREGORY: All right. Thank you. Anyone else? Well, it's only about -- oh. Yes, ma'am.

AN AUDIENCE MEMBER: I didn't speak. Can I just ask a question?

HEARING OFFICER GREGORY: Well, this is just for public comments. You can ask -- what I'm going to do is recess the hearing, and if anybody changes their mind about wanting to make a public comment, that's fine.

During the recess part, the FAA and Air Force reps will be all around these display boards and

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

everything and you can talk about whatever with them. And then if you'd like to make a public comment for the record after that, Teresa and I are going to stay up here, and anyone who changes their mind or if you haven't spoken yet and you want to speak, come on up. And we'll be here until 8 o'clock.

But at this point, since I don't have any speakers who want to make a public comment, I'm going to recess the hearing. You can continue to discuss things with the Air Force and FAA reps over by those boards.

In case I don't talk to you again, I want to thank you for coming out tonight and showing your interest in this proposal. As I've mentioned several times, it's certainly not the end of your opportunity to participate in this process. Those written comment sheets are available at the registration table. You can turn those in tonight or you can mail or fax them later. The address and the fax number are on the sheets.

The Air Force welcomes comments in writing at any time during this analysis process, but let me foot stomp this, to receive timely consideration for the Final EIS, please get those comments in by

November 15, 2010.

If you'd like your own copy of the Final EIS, please tell one of the Air Force reps at the registration table or you can send a letter or postcard asking for your own copy and the Air Force will send a copy of the Final EIS to you.

So at this point I'm going to recess the hearing. Teresa and I will stay up here. If anybody changes their mind and wants to make a public comment, all you have to do is come up here, let me know, I'll reopen the hearing, we'll turn on the machine, and we'll get your comment on the record.

So thanks again. And the hearing is in recess at 7:20.

(The hearing in recess at 7:20 p.m.)

HEARING OFFICER GREGORY: The hearing is called to order. The time is 8:00 p.m. During our recess no one asked to make a public comment. There being no more speakers, this hearing is adjourned.

(The Powder River Training Complex Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)

Registered Merit Reporter

My Commission Expires: 4-29-2016

So with that, Mr. Val Snyder. Sir, would you like to come up here or do you want to speak down there? It's up to you. You might want to use this.

MR. SNYDER: I don't care.

HEARING OFFICER GREGORY: Why don't you use this thing. 2101

MR. SNYDER: My name is Val Snyder. Last name S-N-Y-D-E-R. Some of my comments aren't really gonna fit because I made this up beforehand before I understood the limits.

First, I contest the stated need for this expanded Training Complex. There are already four and a half million acres in this region devoted to modern war-fighting training. The proposal would add 22 and a half million acres, close to a 50 percent increase, and I was wondering what are we as a nation training for. PN-2

The memorandum sheet perhaps tells the story at the bottom with the motto "Global Power For America."

Considering the current debt level of this nation, one question we need to answer is, how much global control can we afford before our foreign creditors foreclose on us? SO-14

By our own hands, two countries lie in ruin

Powder River - Sheridan 10/19/2010

2101 (cont'd) Page 37

with government so corrupt and ineffective that they are now breeding grounds for future generations of terrorists.

Page 432 shows our area, PR-1B, as being under a supersonic ellipse. The readings given on 433 are in psf, decibel C, C-weighted decibels, which I don't really understand, and how they relate to each other or as to actual heard noise.

I have found conversions to decibels from pf -- or I could find no conversion from decibels to psf in the document, and I wonder why the statement uses so many different units to describe impacts, and why acres in one instance, square miles in another, square nautical miles in yet another. I feel that there's a deliberate effort to misinform by constantly switching units of measure to describe the same physical event.

The stated impact of the B-1s I believe is 4 psf, which I did find the version to pascals which can then be referenced to decibels, puts us as about 140 decibels. And most audiologists agree that no human ear should be subject to anything over 135 decibels or even 135 decibels.

And after a sonic boom test over Oklahoma City which ran from February of '64 until halted by

NO-9

NP-9

NO-9

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

restraining order May 13th and finally abandoned the end of July, prominent hearing specialist with the National Academy of Science Zhivko Angeluscheff stated, "I was" -- can I have some light, please?

HEARING OFFICER GREGORY: See if you can turn that light up over there.

MR. SNYDER: Thank you. Zhivko Angeluscheff stated, "I was witness to the fact that the men were executing their brethren during six long months...with their thunder, the sonic boom, they were punishing all living creatures on earth."

During the experiment, 4,901 claims of property damage were lodged against the government. 94 percent were rejected. So you've got some idea of your resolution.

The methods used to evaluate the noise level increases are weighted against the huge area involved. This practice does not diminish the actual noise inflicted upon an individual close to the source, but assumes that the individual is spread very thinly across the whole area.

It seems the first effort is to spread the short duration noise event over a 24-hour time frame, or the onset rate adjusted monthly day-night average sound level.

2101 (cont'd) Page 39

These are listed on Page 435 in decibels rather than psf's, so it's hard to understand what's going on with that between the two.

It is my belief that even if everyone could live with the additional training space, there is no guaranty that the activity levels will remain as shown. The stated justification of this complex is realistic conditions, and I quote, a long commute would not permit aircrews to train for all the complex missions required for modern war fighting. Well, what areas are we training to bomb that do not require a commute? PN-2

HEARING OFFICER GREGORY: How are we doing on time? Let me just ask, has anybody else decided they want to make a statement?

AUDIENCE MEMBER: Yes, please.

HEARING OFFICER GREGORY: Anyone else? Okay, I tell you what. Since you're already up here, go ahead. Put more time on for him and then we'll get to this gentleman after he's finished. So go ahead, sir.

MR. SNYDER: Even if the entire area is granted to do as they please, 15 percent of training, at least, will have to take place on the Utah and Nevada ranges. Exercises in this area involve PN-2

2101 (cont'd) Page 40

mid-air refueling with the tankers coming from Washington State and California. What impacts will this have on our property resale value? Will it complicate further wind resource development?

Page 515 shows that during an average LFE day, between 43 and 244 civilian flights would have to be diverted.

Chaff disbursal, the stated grams per acre assumes that the chaff would be evenly distributed over 35,200 square miles. Is this really the case, or is it more likely that the deployment will be concentrated within routine training routes?

A Navy study found that after discharging hundreds of thousands of pounds of chaff into Chesapeake Bay over 25 years, there was less than a two-fold increase in background organic monomeric aluminum and a decrease in inorganic monomeric aluminum concentrates. So the question is, where did it go?

This chaff that's finer than a human hair is encoded in an animal fat to help reduce clumping. Most of us with animals recognize when it's cold, birds and animals are interested in eating fat. The effects of aluminum poisoning are Alzheimer's symptoms, osteoporosis, and severe neurological

SO-1

2101 (cont'd) Page 41

disorders. There are no assurances that this element will not find its way into the water and animals, only that it exists in the earth's crust. Well, so does arsonic. SA-14

That's about it for me. One last thing is that, being under a training range subjects the citizenry to an assault on their pursuit of happiness and the enjoyment of their property, and in my point takes -- it constitutes a taking. If you wish to buy the area, please buy it. The people who live in these isolated areas are here because they can't tolerate the noise levels of highways, airports, and cities, and that's why we put up with it. Thank you. SO-1

HEARING OFFICER GREGORY: All right. Thank you. Sir, come on up. We'll take care of your card later.

2102

MR. UNHOCH: My name is Bill Unhoch. That's U-N-H-O-C-H. And the point that I have on this is, both South Dakota and North Dakota have fought hard to have Ellsworth and Minot in their states. They lobbied for it. They get all the economic advantages of having these Bases in their states. But yet when they want to increase their training range, they go west into Montana and Wyoming and SO-24

very little into the Dakotas; no training area east of the River, Missouri River.

Why then, if they have all the advantages of -- the economic advantages of having a Base there, why not supply them with the training area that they need?

And then as far as this not affecting property value, think if you're selling your place, the real estate agent brings somebody in, a B-52 flies over. The big thing is, they emphasize a 10-day large force exercise, but it's also a 240-day flight training period. Granted, it's B-52s and B-1s, but personally I wouldn't want a B-52 flying 2,000 feet or 1,000 feet over my house. And this is apparently what their capabilities are.

And this is just -- to me, if the Dakotas want them, let them keep them. Let them supply them with the training areas they need and everything else.

That's -- that's about all I've got to say on it. Thank you for your time. Thank you.

HEARING OFFICER GREGORY: All right. thank you.

MR. UNHOCH: Thank you.

HEARING OFFICER GREGORY: Anyone else? Do either of you gentlemen like to add to what you've already said?

SO-24

PN-2

SO-1

PN-5

PN-2

AUDIENCE MEMBER: I'm good.

HEARING OFFICER GREGORY: Well, I tell you, as I mentioned, Teresa and I are going to stay up here until about 8 o'clock. That's when the hearing is scheduled to end. And if you do change your mind, all you have to do is come let us know and we'll turn on the machine and get your comment.

Let me go ahead and give you some concluding remarks at this point. The Air Force and FAA reps will continue to remain available by these display boards to discuss things with you while we're in recess.

Thanks for coming out tonight to this hearing and for voicing your concerns about this project. As I've mentioned a couple of times already, tonight's not the end of your opportunity to participate in this process. Written comment sheets are available at the registration table over there. You can turn these in tonight or mail or fax them later. The mailing address is printed on the brochure and the comment sheets.

The Air Force welcomes comments in writing at any time during the Environmental Impact Analysis Process, but let me foot stomp this. To receive timely consideration for the Final EIS, please get

those in by November the 15th, 2010.

If you would like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter or postcard asking for your own copy and the Air Force will send a copy of the Final EIS to you.

At this point I'm going to recess the hearing. Feel free to hang around and discuss things with the Air Force and FAA reps. And if you change your mind about making a comment on the record, just come up and let me know and we'll reconvene and get that down for you. So thanks a lot for coming out.

(The hearing in recess at 6:55 p.m.)

HEARING OFFICER GREGORY: This hearing is called to order. During the recess we have had no additional speakers, so this hearing is adjourned.

(The Powder River Training Complex Hearing adjourned at 8:00 p.m.)

My Commission Expires: 4-29-2016

concerns about the proposal that you want the decision-makers to consider. Questions that you pose during your comments will become part of the record and will be considered.

After we're done with the formal part of this, the FAA and Air Force reps will continue to be available to discuss things with you out by the various display boards.

All right. And with that, Mr. Egan. Sir, I don't have a lecturn. I see you've got some materials. You can sit if you'd like. Okay. There you go. 2103

MR. EGAN: I'm Bailey Egan. I'm going to be wearing three hats her tonight representing the Montana Community Airport Association, I'm a landowner, rancher, and a pilot. So I'll be speaking somewhat to all three facets of that, and for three minutes it's going to be hard to cover.

HEARING OFFICER GREGORY: You don't need to worry about that.

MR. EGAN: So it may be a little bit confusing here. But I'm a little disappointed in the draft there. I think it appears to me that it's -- can I ask questions or...

HEARING OFFICER GREGORY: You can pose

2103 (cont'd) Page 35

questions and they will become a part of the Final EIS.

MR. EGAN: Okay. Well, I'll pose the question that possibly it was done by hired -- by somebody that -- it seems to me that it's a little tilted. They come to certain things that are not addressed real fair. And with that, I'll try and go on.

But as a pilot, there's a tremendous problem here that -- I don't know if you've considered maybe with the type of flying that goes on in this -- in this airspace. You show your horizontal pretty well, but there's a tremendous amount of vertical in each one of those that's not really -- it's very difficult to know where you're at, especially in a Super Cub or that type of aircraft. You -- I'm suspicious that it's gonna cause a lot of pilots not to fly just for the fact that they're not gonna know where exactly they're at -- where you're going to be at.

SA-7

And so if you could address that to make it better as far as communications so that they know when the area is hot and kinda what's going on. Because this area is just full of pilots that just -- they're ranchers and they fly that -- that type, low level, you know, checking cattle and that

AM-12

2103 (cont'd) Page 36

kind of thing, and they need to be aware of what you're doing. So if you could make it as easy as possible, if you can, to do that. AM-12

So navigation and communication, add everything you can, if possible, to make this so that we know where you are and what you're doing. AM-3

I don't like the idea -- I tried to find out exactly on the -- I thought those corridors were to get the traffic through. A safety concern there when you start crunching aircraft traffic into one route. I know we have odd and even altitudes that we fly. I just don't like that, you know, everybody flying in the same. You find those in large TCAs and stuff like that and it just -- I suspect that that's a safety issue that you might address. Make them wider and make sure that there's a way that we can identify -- looks like you're using the VORs as a navigation aid. Not sure that out in that area you're gonna be -- you're gonna have to get some altitude to reach those. SA-3

Then as a landowner, there's a lot here that -- I tried to read the -- what your flares are doing. It just amazes me that the State of Montana, all the trouble that they have gone to build these power plants right over here that have to have Class 1 SA-14

2103 (cont'd) Page 37

Air. The Indians insisted upon it, that it has to be good, and then they allow you to come along and dump out these things. And you say they're inert, but there's bohrium, barium, lead, copper, all those things there, and those are poisonous things. SA-14

And so to -- I don't care what the quantity is. You say it's not a big amount, but when you continue to do that, it adds. And you have cattle come along, graze that, and it looked like in one place there that they were talking about lethal levels for cows. You know, what kills a cow? Well, my God, there's a lot of things that happen to a cow a long time before she reaches the death stage. And one of the first things that you -- is her -- the maternity part of the cow. If you start creating unbalances with her minerals and things like that, she gets out of whack, why, the first thing she shuts down is her reproductive abilities. And that's -- that's what I make my living at. SA-14

So I'm gonna be affected possibly by that and I'm concerned about it. And I think that you need to do a whole lot more of background work if you're gonna do this thing. You don't have any idea of what's here as far as those minerals. So there might be areas that are downwind from this point SA-14

2103 (cont'd) Page 38

that could be marginal now and you come along and dump out a little more. I think you need to work on that background. SA-14

Stick up your sign if I'm getting short on time here.

HEARING OFFICER GREGORY: Let me just ask here, has anybody else decided they want to speak yet? Okay, sir, you've got more time. Go ahead.

MR. EGAN: Okay. Well, I won't linger on here. But I'm disappointed that the -- and that's why I wanted to ask the question. I'm a little disappointed that the reservation is not here because they're terribly sensitive to those things. NA-2

And it sounds like you're not going to maybe fly over the -- or are you gonna burn out flares over the reservation and over those places? NA-6

I don't think that's a justice to the rest of us. If they're entitled to it, so am I. And I'm gonna be watching. It looks to me like there is a cartridge that's left, aluminum or something like that. I just can't imagine with the pristine air and stuff that we have here in Montana, that we allow other facets of our government to bring in and dump this. CU-3 NA-6 LU-1

They would be horrified if I went down to

2103 (cont'd) Page 39

Devils Tower and shook out something like that. So I'll end it at that, but I hope you address some of these concerns. Thank you.

HEARING OFFICER GREGORY: All right. Thank you. Thanks for your comments.

Do we have another speaker?

MR. ROCK: I have one more, sir.

HEARING OFFICER GREGORY: Okay. Come on up, sir. Okay, mr. McNaney. Use this table if you need it.

2104

MR. MCNANEY: My name's Dave McNaney. I am a rancher and a pilot also. I'm basically just representing myself.

And I just kinda wanted to agree with Mr. Egan on several comments. The ones that I really -- the area that I'm concerned about is the rougher area, the green area on your map which includes the Colstrip area, as far as the rougher terrain and the low altitude and military flights coming in contact with my civil airplane. Being they fly 500 feet above ground and I come up out of a coolie, there is no -- no time for avoidance on either one of our parts.

SA-7

And I was -- I was wondering, I -- I don't have much to say. I kind of leave with two questions

that one of these gentlemen here tonight might be able to answer. What do the vortices of a B-1 do to an F-19 at 50 to 100 feet difference in elevation? SA-7

And another thing, could some of this be changed? You know, they got -- they got it now that they're gonna fly at 500 feet low altitude. Could they change that and fly at a thousand feet minimum? PN-4

HEARING OFFICER GREGORY: All right. Well, thanks for posing that. And again, that will become part of the record and will be considered.

Anyone else? Would either of you gentlemen like any more time?

Well, I tell what you I'm going to do. We're here until 8:00 if you change your mind. At this point we've heard from everyone who signed up and I have no remaining speakers.

The Air Force and FAA reps will continue to be available out by the boards to discuss things with you during the recess here.

In case I don't speak to you again, let me just go ahead and give you some concluding remarks. I want to thank you for coming out tonight and showing your interest in this proposal.

As I've said several times, tonight's not the end of your opportunity to participate in this

review process. Again, those written comment sheets are available at the registration table. You can turn them in tonight or you can mail or fax them later. The mailing address is printed on the brochure and on the comment sheet.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process, but let me foot stomp this. To receive timely consideration for this Final EIS, all comments must be submitted by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter or postcard asking for your own copy and the Air Force will send a copy of the Final EIS to you.

What I'm going to do at this point is just recess the hearing. And if anyone here changes their mind about wanting to make a comment on the record here tonight, all you have to do is come up here, let me know, we'll turn the machine back on, I'll call the hearing to order, and you can make your comment.

But there being no more speakers at this time, I'm going to recess the hearing. Thanks again.

(The hearing in recess at 6:48 p.m.)

HEARING OFFICER GREGORY: The hearing is back in session. During the recess we had no other speakers. The time being 8 o'clock, this hearing is adjourned.

(The Powder River Training Complex Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

Yes, sir. One more card. Okay, thanks.

With that, I'll call our first speaker. Let's see. From the National Park Service I have Ms. Kate Hammond. Ms. Hammond. 2105

MS. HAMMOND: My name is Kate Hammond, H-A-M-M-O-N-D. I'm here representing the National Park Service at the Little Bighorn Battlefield.

We are concerned about the proposed project which will potentially adversely impact the soundscapes, visitor experience, cultural resources, and sacred sites of Little Bighorn Battlefield. LV-2 CV-2

The mandate of the National Park Service is to preserve and protect the scenery and natural cultural resources of parklands such as Little Bighorn Battlefield.

I note that a portion of Little Bighorn Battlefield is actively administered and maintained as Custer National Cemetery and is the final resting place of about 5,000 U.S. veterans and dependents. The entire Battlefield is on the National Register of Historic Places.

The National Park Service has worked extremely hard to preserve the landscape, vegetation, setting and feeling of the Battlefield to as closely as possible to devote the landscaping and conditions of

1876.

Under the proposed action, you notes about the voluntary restriction of aircraft avoidance area above 2,000 feet. I think that needs to be noted in the EIS. I think the footnotes don't note that that's voluntary. AM-24

So let's see. The EIS notes that three aspects of the increased noise from this proposal could cause environmental impacts, including increases in the ambient noise levels, low-level startle effects, and sonic booms, and we have concerns about the effects of all three types of noise on the soundscapes, visitor experience, and cultural resources. And we disagree with the assertion that infrequent overflights over 2,000 feet would not be expected to be perceived as a significant intrusion to the National Monument. LU-2 CU-2 LU-2

The Battlefield is of enormous significance to American history and to the approximately 280,000 to 420,000 visitors who visit the site annually. It's the second most visited tourist site within the State of Montana and is of great economic importance to southeast Montana. SO-9

Many visitors, Tribes, and stakeholders have commented over and over that the ability to hear the LU-2

2105 (cont'd) Page 37

natural sounds, listen to the wind blowing, and hear the sounds of the Meadowlark is a fundamental part of the Little Bighorn Battlefield experience. Increases in the ambient noise levels, low-level startle effects, and sonic booms would also impact the family members and loved ones who come to pay their respects to the over 5,000 veterans and dependents. LU-2

HEARING OFFICER GREGORY: We have to stop for the train.

MS. HAMMOND: Yes. Sorry.

HEARING OFFICER GREGORY: She can't...

(Brief pause for the train.)

HEARING OFFICER GREGORY: All right.

MS. HAMMOND: Good to go? Okay. So increased noise would also significantly disrupt the solemn and reflective atmosphere for the 10 to 15 funerals that are still conducted annually at the National Cemetery. LU-2

Increases in ambient noise levels, low-level startle effects, and sonic booms all would impact the visitor experience and would impact visitors' ability to enjoy the contemplative and sacred atmosphere. CU-2

All three types of noise would likely impact LU-2

2105 (cont'd) Page 38

National Park Service operational and educational activities such as outdoor ranger programs, guided walks, and ranger talks that take place 10 times a day from May through October and that over 60,000 visitors per year enjoy. LU-2

We also issue approximately 25 Special Use Permits per year for activities such as Tribal religious or cultural ceremonies, commemorative events by military and non-military groups, and commercial filming. Increases in ambient noise levels would significantly disrupt these activities.

As described in the EIS, Native Americans from the four directly impacted reservations explain that low-level overflights and intrusive noise would be detrimental to their cultural practices. These types of cultural practices occur not only on reservations but also at sites such as Little Bighorn Battlefield that are highly significant to Tribal members from 17 reservations throughout the region, and we suggest further consultation with the Lakota, Dakota, Nakota, Cheyenne, Arapaho, Arikara, and Crow Tribes. CU-2

Finally, I'll just note that the EIS notes the possibility of sonic booms causing the failure of glass, plaster, or other structural elements. We NO-2

2105 (cont'd) Page 39

are home to many irreplaceable cultural resources, including historic monuments and structures.

As an example, the two-story stone house constructed in 1894 that is the Superintendent's residence is said to be one of the first permanent homes in eastern Montana. Thanks to preservation work and good care, it retains its historical and architectural integrity and is in good condition. However, it would be unacceptable if sonic booms caused the failure of its historic glass windows and/or doors, or plaster, or disturbed its stone foundation or exterior walls. NO-2

The EIS also talks about the potential of sonic booms to cause items balanced on shelf edges, such as mantels or bookcases, to be vibrated off and fall and break. We have a priceless museum collection stored on site, including 119,000 objects, many of which are fragile and sensitive and many of which are on display at the Visitor's Center.

In conclusion, we're concerned with the proposed action and its potentials to affect visitor experience, natural soundscapes, cultural resources, and sacred sites. LU-2 Our first preference would be the No-Action Alternative, although we realize this may not be feasible given your purposes and mission. CU-2 We

2105 (cont'd) Page 40

note that Alternative B would have had no low-level overflights over Little Bighorn Battlefield, and we would strongly support reconsideration of this alternative, or the modification of the preferred alternative to exclude Little Bighorn Battlefield from the low-level flights proposed under the preferred alternative.

DO-2

Thank you for the opportunity to comment.

HEARING OFFICER GREGORY: Thank you. And if your written remarks contain additional material, I would just remind you you can submit those in addition to your oral comments if you'd like to do that.

2106

Next I have Mr. Del Dinstel. Mr. Dinstel.

MR. DINSTEL: My name is Del Dinstel. D-E-L, last name D-I-N-S-T-E-L.

And I'm a pilot and a landowner. And I own property under the current MOA down in Broadus, southeast of Broadus, and so I've lived -- lived under what they're proposing for here now.

I currently live in Colstrip. My airplane is based there and then I fly back to the ranch at -- 35 miles west of Alzada.

I've done a lot of research on this over the Internet and through the Rapid City Journal,

2106 (cont'd) Page 41

globalsecurity.org. I found out that there's $278 million per year goes into Rapid City economy from Ellsworth Air Force Base. That's per year. That's 2005 -- I got this from a 2005 article in the Rapid City Journal. SO-24

Same article also states that the State of South Dakota could lose $324 million, and that was when in 2005 they proposed to close Ellsworth Air Force Base in the Base closings.

So I think this is more than just us looking like Afghanistan for a training area. PN-2 I think this has a lot to do with the finances. SO-24 And I can't see Montana getting any money out of this thing at all.

So my proposal would be no proposal at all, no training area at all in Montana. GE-2 If South Dakota -- and I never mentioned Minot with the B-52s. If they're benefiting to this degree, then this thing should be based in South Dakota and North Dakota entirely. SO-24

I'm all for Air Force blue and I appreciate what you do. I just took my dad out to St. Louis. He's getting -- he's 88 years old. He was in World War II and he was an Honor Guard under General Douglas MacArthur. And they're down to 20 guys now going to their reunions. But I appreciate what they

Powder River - Hardin 10/22/2010

2106 (cont'd) Page 42

done, I appreciate what you do, too, so... But I got my questions about this expansion.

And going with that, I think also that the B-1 bomber was designed in early '70s. It was then killed by Carter, resurrected by Reagan, and 100 of them were built to the tune of $200 billion apiece. There's now, what, roughly 50 some: half of them in Texas, the other half in Rapid City, South Dakota. PN-6

I'm thinking it's a big hammer to kill the al-Qaeda terrorists with. In fact, I wonder how many they actually get with bombs scattered out in Afghanistan. It's probably one of our bigger ones out there.

Also, what about the B-2 bomber? I thought that was to replace the B-1. B-52s of course, I can remember those when I was in high school. They were shot out of the air like pigeons over North Vietnam by Stone Age people using inferior Russian weaponry. So we still have them and we're still paying for them.

And I don't see where al-Qaeda has any radar that needs to be evaded by flares or chaff, and al-Qaeda doesn't have surface-to-air missiles that I am aware of, nor do they have interceptor aircraft. AM-25

And also, I'm kind of curious about the AM-17

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2106 (cont'd) Page 43

operating costs of a B-1 bomber when mostly what I hear going on in Afghanistan is that the drones are doing most of the killing of al-Qaeda. AM-17

As a landowner, I'm curious about what the reduction in property values --

HEARING OFFICER GREGORY: You have to wait for the train.

(Brief pause for the train.)

HEARING OFFICER GREGORY: We're good.

MR. DINSTEL: Okay. We're back going again, I guess.

And so along those lines, I'm curious as to how many confirmed kills of al-Qaeda terrorists by B-1 bombers. I do know that one of my daughter's schoolmates was killed over in Afghanistan by an IED, and I would like to see you kill that guy who set that bomb. I would appreciate that. It's a kid that used to come over at the house and watch movies and we had him lay around in the family room and got rather attached to him, so... PN-3

I would -- I would like to know also, I'm thinking there's going to be -- also, ma'am, if there's any time left, I would like to speak some more, if I could.

HEARING OFFICER GREGORY: As soon as I get

through these other folks.

MR. DINSTEL: I got property down in Carter County. And I was just wondering, some of the land has sold down there recently. Most of it sold for recreational purposes or investment. Not -- it's out of the price range for ranching, paid for for ranching. But if a potential buyer is going to buy land, why would he buy under an MOA knowing that he's going to have sonic booms and low-level flying. He would just as easily take his money and purchase land outside the MOA. SO-1

So I think it will be -- have an impact on land values and probably home values also. I own a home in Colstrip. So I'm thinking about that.

As a pilot, I have concerns about -- I go down and check livestock and fences and barn with my airplane. I have a Cessna 170. And I have had to bank-and-roll out at wing's level and been looking at the rear end of a B-1 bomber, knowing that he just come by. That does get your attention. SA-7

And I've had very poor luck as far as getting a briefing as to when it's hot and when it's not, what kind of traffic to anticipate down there. I'm a VFR pilot so it's more or less a crap shoot as to know where they're at and when they're going to be in one AM-12

2106 (cont'd) Page 45

place. So as far as trying to avoid them, it's -- it's not -- my experience is, you're not able to do that.

And also, is only South Dakota and North Dakota bombers gonna be training in this Training Complex? So... Is this gonna be something where you bring in aircraft from all over the United States?

And also, my understanding is there's large MOAs, Military Operation Areas, in both Utah and Nevada where these planes could fly and do not have to fly over eastern Montana. Thank you.

HEARING OFFICER GREGORY: All right. Thank you for your comments. And next I have Mr. Kelly Kehler. Mr. Kehler.

2107

MR. KEHLER: Kelly Kehler, K-E-H-L-E-R. I just got some concerns. And I agree with Mr. Dinstel. The economic impact is gonna be great for this area of southeast Montana, whereas all the revenue is left in South Dakota and North Dakota and want to use about a -- a large percentage of Montana state land to control the airspace. And as a pilot, I got concerns there.

I'd like to know how fast this B-1 flies when it comes through, but, you know, it's kinda like letting certain cars on the Interstate go 10, 20

AM-12

PN-2

SO-24

SA-7

times faster than anybody else. I don't think that's probably quite right here, but...

He stated there are 17 charted noise areas, and I think there's a lot more than that. You mentioned calving, Tribal, and birds. I can guarantee you there's way more than that 17 people that have cattle in southeast Montana.

And you mentioned TFRs for fires. Well, Crow Tribe has a contract here and it's -- there's lots of grass fires. This year luckily there wasn't. But these aren't ran out of Boise and issued TFRs until they get to a certain type stage. These are small grass fires that happen at the spur of the moment and time is of the essence. It -- to have the guy have to wait and find out if he's gonna -- and it's a job when they're fighting a fire, he's looking down at the ground. It's not see-and-avoid. All this stuff that we're talking about happens in 500-, 2,000-foot range; not alone with the flights coming and going in the area.

There's a lot of migratory birds and geese and stuff and they travel south for the winter. Your area takes in several I can see here. North Ton River, the Bighorn River, several main waterways, and the geese love to travel from up north to south

SA-7

NO-10

SA-5

SA-1

SA-10

2107 (cont'd) Page 47

for several months in the winter. They travel at times in your altitude. That's a concern. You change their pattern. SA-10

All of this comes back to some economics here, too. It's just like Mr. Dinstel said. What is -- a guy can come in here and fish or tourism, and a lot of these guys that come in fly their own aircraft. They're gonna -- they don't want the hassles. They're on a tight schedule. They don't want to be here and not know if they can leave on the day they want to leave. It's a concern. SO-9

There's still lots of areas that have poor cell coverage, so it's not just grab your cell phone and call 1-800-WX-BRIEF and find out what's going on. A lot of guys are doing their recon on their livestock, this and that. You're looking down at the ground. You're not trying to look at -- you're by yourself, you're focused on the terrain and what your -- what your job is out there. AM-3 SA-7

As well as nothing was mentioned of the -- this is a big ag community. There wasn't no mention of the crop dusters in the area. And typically they're spraying pretty much all growing season. And as a crop duster, you're a single person focused on a job and you're flying low level. Then you rise up on SA-7

2107 (cont'd) Page 48

your ends and you're back and forth. You can't be looking out the window to see who's gonna be coming up over the next ridge. That's a concern. SA-7

That could go back to the economics of this. And if they gotta, "Oh, I can't spray your crop until the weekend," I mean that just doesn't work. That's an issue. And... SO-2

But I do have to say, I appreciate your protection, so I'll give you -- I do appreciate that and you guys coming out here. NP-3

That pretty well wraps it up for now. If I have anything else, I'll put it in as a written comment.

HEARING OFFICER GREGORY: Okay.

MR. KEHLER: Thank you.

HEARING OFFICER GREGORY: Thank you. Mike Parnell.

2108

MR. PARNELL: Thank you. It's Mike Parnell, P-A-R-N-E-L-L.

I appreciate the opportunity that you've provided for this. My impression is you've probably done dozens of these and I sympathize with your lack of enthusiasm for our comments, but I appreciate the opportunity. NP-3

I'm a member of the Bighorn River Alliance

Powder River - Hardin 10/22/2010

2108 (cont'd) Page 49

which is a non-profit group of outfitters, anglers, and guides to protect the Bighorn River. I'm also a private and commercial pilot. I own land that will be affected by this proposal. I also own and am involved with a strip that's not one of the 12 airports that you mentioned and it was completed in April of last year but would be affected by this Powder River training area. And I have -- that land is used for agriculture but also grazing of livestock and recreational purposes.

I oppose any expansion to the existing Powder River Training Complex of PR-1B MOA. It would have a tragic effect on livestock and human quality of life. GE-2 LU-2

We've had a couple of examples of that just during this meeting when we had to suspend conversation and operations for well less than 100 decibels that Ms. DeVine described.

It will significantly degrades the fishing and recreational use of the Bighorn River and the surrounding terrain which is the primary economic engine that brings money out of state into our state, and especially for Hardin and Fort Smith. There are other blue-ribbon trout streams that are available that would not have these adverse impacts. SO-9

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2108 (cont'd) Page 50

It was mentioned earlier on, this is a conservation effort so we don't have to burn as much fuel for our military aircraft to get to different training exercises or locations, but as a pilot, if I'm heading east, I have to divert 50 miles north, 50 miles south, or 225 miles east to stay clear of this proposed area which is excessive. And I think if you combine all the private and commercial aircraft activities, that it's not a savings in fuel, even though I know the military aircraft burn considerably higher rates than what I fly. SO-7

You know, you presented that the proposed practice is bad. You gave all -- several reasons of why it's bad and that's why you're proposing that it's only going to be bad for a limited or restricted periods of time, but the practice is still bad. CM-3

I also disagree with the statement that it would not have or is unlikely to have an impact on the quality of life or property values. And I think the train was a fairly good example of that. LU-2 SO-1

You know, as far as the quality of life, if there are three days per quarter and four quarters and 20 aircraft involved in these large force exercises, that's 240 days of supersonic events, and LU-2

2108 (cont'd) Page 51

that's if only one aircraft were to make one sonic boom effect on one individual. So this is probably more than one per day average. And I think that's significant. Even though you say it's limited to approximately 10 days, with that many aircraft it's significant. LO-2

Thank you for the time.

HEARING OFFICER GREGORY: You're welcome. Thank you. Mr. Mike Ferguson. Mike Ferguson.

2109

MR. FERGUSON: My name is Mike Ferguson, F-E-R-G-U-S-O-N. And did you want the address?

HEARING OFFICER GREGORY: No.

MR. FERGUSON: I'm the Northwest Regional Rep for Aircraft Owners and Pilots Association and I'm sure a lot of people in this room are members. We're the largest aviation organization in the world, having over 415,000 pilots in the United States as members.

Incidentally, I'm a Montanan; lived in Montana except for my years in the U.S. Air Force. And so I'm not speaking of hypothetically, you know, from AOPA Headquarters in Maryland. I am, however, speaking on their behalf.

The AOPA feels that your proposed Draft Environmental Impact Statement will have a

Powder River - Hardin 10/22/2010

2109 (cont'd) Page 52

devastating impact on general aviation. The proposal does not match the demonstrated need. The Air Force will chart 44.5 hours of use each week but expect to use only 15 hours. This provides the Air Force enormous flexibility at the expense of general aviation flexibility. PN-2

The Air Force is proposing the option of activating the SUA at any time with a NOTAM. General aviation pilots plan flights based on charted data, often because it's the only data available when the flight is being planned. AM-12

Altitudes below 2,000 feet only used 10 percent of the charted time. AOPA would like to see additional stratification by creating a sector from 500 feet to 3,000 feet that is only activated when needed. This alone would substantially improve the proposal by permitting transient operations and ingress and egress at underlying airports. AM-26

The economic impact of general aviation industry according to a 2009 AOPA member poll, 64 percent of the pilots avoid SUAs regardless of activation status. Given the scale and charted hours of use, the PRTC proposal effectively closes 39 airports, grounds 285 aircraft, and bars countless transient operations in an airspace area SO-7

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2109 (cont'd) Page 53

the size of South Carolina. Economic impact will be felt by airports, FBOs, flight schools, individual aircraft owners, small businesses, ranchers, and transient pilots that use general aviation. SO-7

Safety concerns for non-participating traffic, see-and-avoid is predicated on airspace below 250 knots. The Air Force plans to fly as fast as 540 knots. See-and-avoid, therefore, becomes unuseful. Lack of communications and radar coverage becomes more important because the Air Force is suggesting that general aviation pilots contact ATC to determine the activation status of the SUA. SA-7 AM-3

Chaff and flares present hazards to flight as airborne FOB. Thank you for the opportunity to come and testify. SA-26

HEARING OFFICER GREGORY: Thank you. That was good timing.

(Brief pause for the train.)

HEARING OFFICER GREGORY: Is there any other speaker card that I don't have? Because that's all the ones I've got up here. Did anyone fill one out back there?

MS. DINSTEL: I would like to fill one out. Would you like me to come up?

HEARING OFFICER GREGORY: You can come on up

Powder River - Hardin 10/22/2010

Page 54

and we'll do the card. We'll pick that up later. Please state your name and spell the last name.

MS. DINSTEL: My name is Sharon Dinstel, D-I-N-S-T-E-L. 2110

I come to you as a speech and language pathologist. And you're probably wondering why.

Tonight I'm glad I came because I was educated on an issue that I was not aware of. You call it sound exposure. I may call it noise pollution. I'm concerned about this over populated areas. NO-5

You note -- you mention that it would be greater than 100 dB. I would like you to be more specific. I find that to be very vague. NO-4

We know that exposure could cause permanent damage. We also know that it is not healthy to be exposed to things at this level. We can be exposed often without warning.

I grew up on McDonald Douglas air pattern, their test flight, and we had sonic booms all the time in St. Louis, and so I did grow up with that.

I am married to Del Dinstel and we have -- we're in your fly zone down at Bridge, Montana, so I've experienced that. And I do ask that you give us specific answers on what dB's. You know, again I feel that's vague. NO-4

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2110 (cont'd) Page 55

I work for the Northern Cheyenne and the Crow Tribes, and I would like some answers to go back to them with. Thank you.

HEARING OFFICER GREGORY: Okay, thank you. Anyone else? Is there any speaker who already spoke that would like more time? Mr. Dinstel, would you like more time?

MR. DINSTEL: Yeah.

HEARING OFFICER GREGORY: Because we've got time. More time on the clock for Mr. Dinstel.

2106 (part II)

MR. DINSTEL: Yeah, I don't know if I mentioned it or not, but I favor no action, no expansion based on what I already know of living under the existing Powder River MOA. GE-2

But I would like to read this article, and it's about making Ellsworth more secure and it's by the Rapid City Journal. It was in the Opinion page July 30, 2010.

It says, "Securing the future of Ellsworth Air Force Base became an important mission in 2005, when it was slated for closure.

The base survived thanks to political lobbying and community effort, an effort that has been maintained since then, and took another important step forward this week.

2106 (part II cont'd) 10/22/2010

Powder River - Hardin

The South Dakota Ellsworth Development Authority, created by the Legislature to keep the base viable, just purchased 230 acres of Box Elder land that will become a new mobile home park for people living in areas around the base.

Relocating those residents will help Ellsworth off of future base closure list" -- "help to keep Ellsworth off of future base closure lists.

Encroaching development is one of the major factors the Department of Defense considers in targeting military bases for closure.

Hundreds of people are living in mobile home parks close to the base, an area considered at high risk for military aircraft crashes.

Noise from the base also tends to generate complaints from people living nearby, a situation the Department of Defense prefers to avoid.

Moving residents out of the areas deemed unsafe isn't cheap. The Ellsworth Development Authority used a South Dakota Housing Development Authority grant to buy the Box Elder land at public auction by placing the high bid of $574,500, or $2500 per acre. It was an innovative use of tax dollars to make the Ellsworth Air Force Base" -- or "a move for the public good.

2106 (part II cont'd) 10/22/2010

Powder River - Hardin

Ellsworth Air Force Base employs 5,000 people and generates $10 million in sales taxes for the local community," per year. "Closing it would adversely impact the state to the tune of $324 million."

I want to read that again. Closing Ellsworth "would adversely impact the state to the tune of $324 million.

The Department of Defense doesn't concern itself with those issues when targeting military installations for closure.

It looks at the viability of the base and its value for the military, just as it should. But the adverse economic impact on Rapid City and South Dakota if Ellsworth were to close would be deep and long-lasting.

That's why state and local leaders stepped up to save Ellsworth. That's why they continue their efforts to make sure it can meet the federal government's needs.

The land purchase is quite a coup for the authority, which was assigned to work with local governments, developers and property owners to minimize incompatible development around the base, and relocate existing incompatible development. Job

2106 (part II cont'd) 10/22/2010

Powder River - Hardin

Page 58

well done."

I think that -- I think that this expansion of the Powder River MOA to a large degree is also about keeping Ellsworth viable. And to a large degree, it was pushed by Senator John Thune, Senator from South Dakota. And one of the things is, out here in Montana we -- we don't get the luxury of voting that guy in office because we don't get to vote in South Dakota, but...

SO-24

So again, I would like to say that 324 million reasons why South Dakota wants this expansion out here and not in South Dakota. Thank you.

HEARING OFFICER GREGORY: Thank you. Anyone else?

MR. KEHLER: Just one short tidbit.

HEARING OFFICER GREGORY: State your name for her one more time so she has it.

2107 (part II)

MR. KEHLER: Kelly Kehler. I want to make it clear for the record, I'm a land and livestock owner, commercial pilot, and opposed to any expansion to the Powder River MOA. Thank you.

GE-2

HEARING OFFICER GREGORY: Okay. Anyone else? Well, as I said, it's 7:20. Teresa and I will stay up here until 8:00 if anybody changes their mind. All you have to do is come up and tell me, I'll

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

reconvene the hearing, we'll turn the machine on, and we'll get your comment on the record. Before I recess, let me give you some concluding remarks here.

The Air Force and FAA reps will continue to be available out by these various charts to discuss things with you.

I want to thank you for coming out tonight and thank you for your comments concerning this Powder River Training Complex EIS proposal. As I mentioned a couple of times already, today's not the end of your opportunity to participate in this process. Written comment sheets are available at the registration table. You can turn these in tonight or you can mail or fax them later. The mailing address is printed on both the brochure and on the comment sheets. Here comes another train.

The Air Force welcomes public comments in writing at any time during the Environmental Impact Analysis Process.

THE COURT REPORTER: Can you talk over that?

HEARING OFFICER GREGORY: Do you want to try? Tell me if you can't hear. Can everybody hear? Okay, let's wrap it up.

To receive timely consideration, let me foot

stomp this one more time. Your comments must be submitted by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the registration table or send a letter or postcard asking for your copy and the Air Force will send a copy of the Final EIS to you.

It's about 7:22. I'm going to go ahead and recess the hearing at this point. And again, if you change your mind about wanting to add to your comments or want to make a comment for the first time, please come on up here, let me know, and I'll reconvene the hearing. Thank you very much.

(The hearing in recess at 7:22 p.m.)

HEARING OFFICER GREGORY: The hearing is called to order. The time is 8 o'clock. We have had no additional speakers. This hearing is adjourned.

(The Powder River Training Complex Hearing adjourned at 8:00 p.m.)

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

MR. DONALD SPOTTED TAIL: It is a privilege to have the Air Force here this morning to make their presentation. At this time I will call on the son of the Secretary of the Great Crow Nation to say the Opening Prayer.

MR. ANDREW RUSSELL: Thank you. I'm gonna say a prayer this morning before the meeting starts. Just bear with me a little bit here.

(Opening Prayer by Mr. Andrew Russell)

MR. DONALD SPOTTED TAIL: (Speaking in native Crow) So at this time it's my great privilege to introduce the Secretary of the Great Crow Nation, Mr. Scott Russell all the way from Crow Agency, Montana, by way of Porcupine, South Dakota.

(Applause) 2142

MR. SCOTT RUSSELL: Thank you. And good morning, everybody. (Speaking in native Crow)

I'd like to recognize the staffers from our United States Senators and our Representatives. J.T. Korkow, if you would stand up, from Dennis Rehberg's office, Washington, D.C.

(Applause)

MR. SCOTT RUSSELL: Senator Max Baucus' office, Jim Corson. Great to see you again.

(Applause)

2142 (cont'd)

MR. SCOTT RUSSELL: From Senator Jon Tester's office, Rachel Court, formerly of Hardin, Montana.

(Applause)

MR. SCOTT RUSSELL: Why we are here today goes way, way back. 1851, Fort Laramie Treaty where the Crow Nation had 38 billion acres. And within that 38 million acres -- (Speaking in native Crow) And within that 38 million acres, we should still have a say in what's going on. We're talking about airspace training.

We are at war as a nation. And in times of war, you've heard this before, in times of war, Native Americans and a lot of Crows enlist. We hold the highest percentage rate per capita of any enlistment of any minority group in times of war. We're warriors. (Speaking in native Crow)

It's very similar in geography, the geological landscape. Afghanistan, Iraq is very similar to your land here. And in times of war, we enlist. We send warriors out because we come from a militaristic background. We come from a militaristic society. And what we do as a nation to contribute to the United States of America, I think we've given a lot. Do we stop? I don't think so.

If you look at from World War I on forward,

2142 (cont'd)

Powder River - Crow Agency 10/25/2010

Page 4

every time there's a war, each and every one of us have family members that were a part of that. It brings a lot of pride. It brings honor to our people.

Why the Air Force is here today is to ask you, are we gonna let them fly over our land. They'll tell us just about everything, how it's gonna affect the sound, just about everything you can think of. (Speaking in native Crow) Training ground. (Speaking in native Crow)

We are warriors. The United States has called upon us to help them out. (Speaking in native Crow) Even the United States Air Force. Everything that we're doing right now is geared towards helping this country. We're trying to come up with Dakota linguistic projects that would reduce this country's dependence on foreign oil. And if we're able to produce diesel fuel right here on the Crow Indian Reservation, the United States Air Force can buy our diesel fuel because the technology that we have now has proven, it's proven to be more effective, more economical, and they land planes and they can fly higher atmosphere. (Speaking in native Crow)

If you think about the bigger picture and look back what we as a nation can contribute to the

GE-9

Page 5

United States of America, it's all good. (Speaking in native Crow)

It's for your benefit. There's a lot of questions. (Speaking in native Crow) Rumors. (Speaking in native Crow) Development. (Speaking in native Crow)

You got a new playground that's being developed right there at Henrietta Park. Casino. (Speaking in native Crow) College. (Speaking in native Crow) Gymnasium. (Speaking in native Crow) Big library. (Speaking in native Crow)

It's for our children. It's for our community. (Speaking in native Crow)

We are heading to a new season. (Speaking in native Crow) Each new season. (Speaking in native Crow) Pray to the Creator that this next season brings something good for our people, not just for ourselves. (Speaking in native Crow)

(Applause)

MR. DONALD SPOTTED TAIL: (Speaking in native Crow) Makes a good politician. While we're introducing staff -- (Speaking in native Crow) Stand up, Channis Whiteman. Let's all welcome Channis here. Let's all give him a round of applause. It's good to see you, Channis.

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2142 (cont'd)

(Applause)

MR. DONALD SPOTTED TAIL: At this time it's my privilege to introduce Mr. Gregory from the U.S. Air Force. So I will give it to him.

HEARING OFFICER GREGORY: All right. Thank you very much. And thank you for inviting us here today to provide you information on this proposed expansion of the Powder River Training Complex. This is a public hearing for the Powder River Training Complex Environmental Impact Statement which you'll hear referred to as EIS.

Looks like we need to wait for our projector to warm up.

(Brief pause)

All right. As the next slide is going to show, I'm Colonel Ron Gregory. I'm a judge on the Air Force Court of Criminal Appeals back in Washington and I sometimes assist with hearings like this. I'm not assigned to Ellsworth Air Force Base. I don't work for anybody there. I don't work for anybody at Air Combat Command. And I'm not involved in any way with the development of this Draft EIS, and I don't act as a legal adviser to any of the Air Force representatives that are working on this proposal. My role in the hearing is simply to be an impartial

we'll get your oral comment.
But before I recess the hearing, let me just ask, is there anybody who wanted to make an oral comment on the record here right now? If you do, we'll get you one of these cards. And if not, I'm going to recess the hearing. If you change your mind, just come on up and let me know.
Anyone need a card? Anyone? Well, before I recess, let me give you some closing reminders about this.
Have we got one back there? No? Okay.
THE COURT REPORTER: This lady wants to speak.
HEARING OFFICER GREGORY: Okay. There you go, Brad. Right there. 2111
MS. SHANNON ROCK ABOVE: (Speaking in native Crow)
HEARING OFFICER GREGORY: Ma'am, she doesn't --

MS. SHANNON ROCK ABOVE: (Speaking in native Crow) Fighter bombs. (Speaking in native Crow) Sonic bomb. (Speaking in native Crow)
And then I used to live in Billings where the

airplanes went across my apartment. (Speaking in native Crow)

So when you're thinking about the environmental compact -- or environmental situation, you have to think about the air and what it does to you. (Speaking in native Crow)

Sometimes it goes every half hour. You hear it. It keeps you up at night and it's noisy. And when you're thinking about the environmental impact, you have to think about that noise. Can you live with that noise 24 hours a day?

LU-1

NO-5

And one time I was at Langley Air Force Base and the F-16s went -- (Speaking in native Crow) It took a whole -- they left at 6:00 in the morning and all the F-16s were off the airfield by 12 o'clock, one after another loud. So if you want to think about that.

HEARING OFFICER GREGORY: Okay. She's going to do the card.

All right. Thank you. Is there anyone else who wanted a card to say something at this point? Anyone? Anyone?

Well, as I mentioned, I'm going to recess. If you change your mind, just come on up here. Let me give you some concluding reminders before we go into

recess in case I don't get a chance to talk to you again.

As I mentioned, the Air Force and FAA representatives will continue to be available back by all those posters and charts and things to discuss things with you.

I want to thank you again for having us out here this morning to brief this for you and to receive your comments. This is certainly not the end of your opportunity to comment. As I mentioned, those comment sheets are available at the registration table. You can turn them in today. You can mail or fax them later.

And the Air Force welcomes public comments at any time during this process, but to receive timely consideration, please get those in by November the 15th, 2010.

If you'd like your own copy of the Final EIS, please tell one of the representatives at the table or send a letter or postcard asking for your own copy and the Air Force will send you a copy of the Final EIS.

At this point I'm going to recess the hearing. And if you change your mind about wanting to put a comment on the record here today, just come on up to

the table and I'll turn the machine back on and reconvene the hearing. Thank you.

(The hearing in recess at 11:15 a.m.)

HEARING OFFICER GREGORY: The hearing is called to order. During our recess we have had no additional speakers and the crowd has departed the auditorium, so I'm going to adjourn the hearing.

(The Powder River Training Complex Hearing adjourned at 12:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the forgoing Pages 1 through 40 are a true and correct transcription of my stenographic notes.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

equal weight to written and oral comments. Both become part of the official record and are included in the Final EIS.

Just a few reminders before we get started on this part. First, please limit your comments to the Draft EIS. That is the purpose of this public comment period. Second, if you agree with a previous speaker, you can certainly say that, but you don't need to use up your time restating it since it's already in the record. Finally, as I mentioned earlier, this formal part isn't a Q and A session. It's an opportunity for you to put on the record your views and your concerns about the proposal that you want the decision-makers to consider. Questions that you pose during your comments will become part of the record and will be considered.

After we're done with the formal part of this, the Air Force and FAA reps will continue to be available back by all those boards and charts and things to continue discussing things with you.

And with that -- have you got another one? Okay, thanks. Let's see. I'll just start dealing off the top here. Ms. Kay Carlson. Ms. Carlson.

2112

MS. CARLSON: My name is Kay Carlson,

2112 (cont'd) Page 35

C-A-R-L-S-O-N. And my comment is basically as a wife of a Vietnam vet with PTSD, I'm concerned about the noise issue for everyone. We have had a lot of large fireworks this year in our neighborhood, and after just that kind of noise my husband is not functional for several days. And my main concern is all the war veterans who have come back who have PTSD, who have traumatic brain injury, and who have to deal with the noise issue. NO-11

HEARING OFFICER GREGORY: All right. Thank you, ma'am. Next I have Mr. Dinstel.

2113

MR. DINSTEL: My name is Del Dinstel, spelled D-I-N-S-T-E-L. I'm from Colstrip and I'm a pilot and a property owner. I own ranch land in -- under the existing MOA just east of Belle Creek, Montana. It's under the existing Powder River MOA. So I've experienced living under an MOA since the 1980s. I also own a house and a hangar and an airplane that I keep based in Colstrip, and I fly back and forth to my property in Carter County.

I've had an incident where I've been checking cows, counting bulls, and banked out of a turn, went wing's level, looked out of the corner of my eye and seen the rear end of a B-1 bomber. Now, that will get your heart right up in your throat, knowing that SA-7

he just came by you doing 550 miles an hour. It's hard to keep one eye on -- on your livestock and one eye on the horizon. Very difficult. It's a safety issue. My family flies with me quite a bit of the time. SA-7

But in digging around looking for why, you know, it's easy enough to say that they need this training area, but there is large training areas in Utah and Nevada that are already existing. Why do they need to expand this? PN-2

In a search for the reason why, I came across something that was written on July 30, 2010, in the Rapid City Journal. Ellsworth Air Force Base employs 5,000 people in the Rapid City area and it generates in excess of $10 million in sales tax for the Rapid City economy per year. Closing it would adversely impact the state to the tune of $324 million per year. SO-24

So my -- I oppose the expansion of this. I don't oppose Military Operations Area per se, but if it's gonna benefit South Dakota that much, and I've never even looked and added on what Minot gets in North Dakota, I think this expansion should be in North Dakota and South Dakota, not in Montana and Wyoming. PN-2

2113 (cont'd) Page 37

They have an area to train. They can do it already. And I do not think that it needs to be in Montana. PN-2

Living under it, it's not -- it doesn't address -- also, it does not address what hunting and outdoor tourism, guiding and whatnot, what that's gonna do. LU-5 SO-9 If you're under this area, our clients, you know, aren't gonna recommend to the next client that they come out here while they're having large force exercises.

Also, the property values: property just next to mine sold for $550 an acre to a man that wanted to invest in the property. I don't think you're gonna -- the current property owners are gonna be able to snag that kind of a buyer. If he's got that kind of money, he can put it -- buy land that's not under an MOA. Thank you. SO-1

HEARING OFFICER GREGORY: All right. Thank you. Mr. Bob Bergerson. Mr. Bergerson.

2114

MR. BERGERSON: Thank you, Colonel. My name is Bob Bergerson. It's B-E-R-G-E-R-S-O-N. As an ex-Vietnam Navy person, also ex-Air Controller/several other Navy schoolings I've got, I have a hard time trying to accept the Air Force's reason for putting extremely expensive aircraft and PN-4

2114 (cont'd) Page 38

old aircraft down at such a low level. PN-6

I've experienced several mid-air air collisions as an Air Controller, and with today's technology and our new stand-up weapons, I don't see any sense PN-3 in why we have to torture big, beautiful aircraft like that. I just -- I don't see it. We have the technology to -- to keep the aircraft out of harm's way using crews missiles, UAVs and stuff like that.

And a lot of the other questions have already been answered for me. Thank you. That's all I've got. Thank you.

HEARING OFFICER GREGORY: All right. Thank you. John Glen.

MR. GLEN: Colonel, I would like to defer my statements until just a little bit later, if that's all right.

HEARING OFFICER GREGORY: I'll put you on the bottom of the deck.

MR. GLEN: Thank you very much.

HEARING OFFICER GREGORY: Mr. John Patterson.

2115

MR. PATTERSON: Thank you, Colonel. My name is John Patterson. I'm a rancher at Custer, Montana. P-A-T-T-E-R-S-O-N.

I've been in the military 33 years, the Army side, retired Lieutenant Colonel. That's nice.

2115 (cont'd) Page 39

The Air Force wants to fly over. One area I'm concerned about is the sonic booms. If I'm out there in June or July with a young horse colt on the ranch riding, there's enough things out there on the sagebrush down on the ground to make him take off and leave me in a big run. If I know the sonic booms are gonna take place a few days before they take place, I'll make sure I or my ranch hands are not riding that young colt. So I would just ask the Air Force to let us know in advance when you're gonna be doing these maneuvers and when the potentials are for sonic booms. That way I won't be on the young colt, nor my ranch hands.

AM-12

I know you're gonna have sonic booms. They're hard to track. They're like thunder. They should be two claps. Last time I heard a sonic boom in Montana is when the Space Shuttle returned back to Florida. They told us about it in the news media and they said it would be one or two booms. We heard it, we all knew about it, not a big deal. We just said thank God the Space Shuttle's back in America.

If I know you're gonna be doing training work -- my ranch covers part of a training area. I've seen the silica and so on, things like that.

2115 (cont'd) Page 40

Just let us know in advance. I know you plan to go out and tell the news media, but sometimes they may not put it down, so take out -- take out some newspaper ads. Sometimes the TV stations may not pick up the news media saying they're gonna be using this training area. If you're not gonna use it 10 days at one time and you may use it for three days for 90 days and there may be a nine-day break and there may be three more days, so you may use this area four times a year, may use flyover for three days, days and night, just let us know in advance so we don't have any young teen-agers out there, young kids, like fourth, fifth graders riding a horse like in June, parents come out for a summer vacation and visit my ranch, put the young kid on a horse, first time they've been on a horse on a ranch in Montana, not a good time to have something spooky and jittery.

SA-9

That's the only request I got. Just let us know in advance. I'll make sure my people know about it and I'll say, "Okay, we're not riding today. Potential sonic booms are there. Let's not do it." Yeah, I don't ride my horse during thunderstorms. That's not a good thing.

AM-12

So just let us know in advance. I can schedule

2115 (cont'd) Page 41

around it. You have your schedule, I have mine. Okay?

AM-12

HEARING OFFICER GREGORY: Mr. Kammerer.

MR. KAMMERER: My name is Marvin Kammerer. I'm from Meade County, South Dakota. Over the ridge we join Ellsworth Air Force Base.

2116

It's spelled K-A-M-M-E-R-E-R. In German it means caretaker. We probably followed the Lord's horses up with a shovel.

The day's coming I won't come back up here with a hat on this time of the year. That wind was rather strong coming up here.

We're talking about a book here, and I'm gonna get three minutes to express my opinion. 500 pages here. What kind of business is this? And a lot of us old boys, he was just referring, well, let them know that they're gonna come through with these planes.

They didn't even advertise it in my local county paper. I checked with the Belle Fourche paper. They didn't even advertise in that paper. The only way they found out there is they picked it up out of the Rapid City Journal.

NP-8

Come on, fellas. We deserve better than that. Grand-dad didn't walk in here in 1882 with an

2116 (cont'd) Page 42

ox-train from Ft. Pierre to get this kind of treatment.

36 people have died in plane crashes on our ranch. I know about the noise. I got a little gimmick here that I found out in the neighbor's pasture some years ago just like it. Mounted on a stake, wire run into it with a little box. It's a decibel reader. Very intriguing. I even went and got another one. My neighbor's got it now. It tells you a lot of things.

If you had read Reuters' explanation of a Swiss study on noise and how it affects people and it brings on -- multiplies the danger of heart attacks. It's not mentioned in here. NO-11

You people who like to watch the sage-grouse, he might go on the endangered species, especially if he's bothered by these overflights. BI-3

We used to raise ducks, geese, and turkeys, just enough to keep around for a little fast-food for the unexpected visitors or whatever. When they brought in the B-52s and the B-1s and the B-36s, we ceased to get hatches. Out of a dozen eggs, you might get two that hatch. Checking the eggs, you would find out the embryos had started. BI-2

I think the vibration, the decibel pounding

when the bird wasn't on the nest, and they nest outside, killed it. Now, if that's not good for the birds, it damn sure isn't good for me or my kids. Treat us with respect, for Christ sakes. BI-2

This chaff -- I've got a letter from the Colonel. And by the way, the Colonel ate rhubarb pie that I made in my house; set there one day and we talked about this stuff. Taliaferro.

You people cannot bring any more of this invasion on our privacy. We raise food. We raise beef and pigs and grain. LO-1

And everybody who runs a private airport, there are hundreds of private planes out there, they aren't even listed. They don't even know this -- what you're trying to do is going on for most of it. AM-4

Here we are, my three minutes is up. And this book, 500 pages, try to read it. It raises as many questions as it answers.

I drove 300 some miles to be here to this meeting today, but I'm going to see a brother who's in a hospital here. He's another vet. I have three cousins get shot down in World War II. They survived. One of them had three planes go down.

Pay attention to us. Don't look for new avenues to expand your -- your -- your meaning.

2116 (cont'd) Page 44

This isn't about national security. This is about feeding the tiger; Rapid City's Chamber of Commerce proud and everything that goes with it, state government. That isn't your responsibility. Thank you. PN-3

HEARING OFFICER GREGORY: All right. Thank you. Ms. Debbie Alke. I hope I got that right.

MS. ALKE: Good evening. I think everybody can probably -- well, I'll speak into the mike. 2117

My name is Debbie Alke. That's A-L-K-E. And I'm the Administrator for the Aeronautics Division from the Department of Transportation out of Helena, Montana.

And on behalf of the Department, I would like to thank you for your service to this great country. We're appreciative and support the great job that you do keeping all of us safe. GE-9

But we do have many questions, a few I'll mention tonight, about this proposed expansion and most that will be articulated in our written comments that we will be submitting by the deadline.

You know, Montana is currently home to the Hays Military Operations Area in north central Montana. We also house the current Powder River -- the majority of the current Powder River Military

2117 (cont'd) Page 45

Operations Area in southeast Montana.

We're supportive of this airspace and we're happy to share that with you, but we currently feel that Ellsworth's home state of South Dakota and Minot's home state of North Dakota should be able to accommodate the training needs of the Air Force Bases and that you should look to those states for that accommodation. There's no positive impact or benefit to the State of Montana by this proposed expansion.

PN-2

SO-24

The EIS states that the Tiger, Devils Lake, and Lake Andes MOAs located in North Dakota and South Dakota are not adequate. They don't have the dimensions, the altitude structure, or the electronic capabilities to meet today or tomorrow's training mission. It's clear that the existing Powder River MOA does not provide that either. And if these are necessary, we ask that you look to expanding those three MOAs in the Dakotas, or if Powder River is your only option, look to expanding to the northeast and the southeast.

PN-2

The revised proposal also eliminated the impacts to the Billings, Bismarck, and Dickinson airports because of concern over navigable routes and limited radar and radiofrequency coverage. The

AM-5

2117 (cont'd) Page 46

same should be done for Montana's other six public use airports of Ashland, Baker, Broadus, Colstrip, Ekalaka, and Hardin, and for the other 40 plus private airstrips that would be located under this proposed expansion.

AM-5

The EIS also states that the number of airports and airfields create what is perceived as an impact by airport operators and users. This is not perception. This is very real.

Southeast Montana aviation businesses in recent years have seen a considerable amount of increase in oil exploration work which has increased the general aviation traffic to this region. IFR aircraft will not be allowed into this area when the MOA is active.

SO-10

These aircraft typically use services. They land. They buy fuel, restaurants, hotels. And these businesses, these Fixed Base Operators, flight schools, they rely on transient traffic for the majority of their fuel sales and their business income. The EIS is incorrect stating that this is a perception.

VFR traffic as stated are allowed into the area. You're to be seen and be seen, but the safety to this traffic is a very high risk. They're

SA-7

2117 (cont'd) Page 47

sharing this airspace with large, low-flying, high-speed, high-performance bombers and fighters which is not a good thing. SA-7

Montana's home to 80 essential air service airports. Seven of these are located in eastern Montana. These are essential air service designees because of their necessity to enter the air transportation system. They have very limited public transportation. The carrier that serves these airports comes from the southeast, Cheyenne and Denver primarily, and when the LFEs are happening they will have to divert to the gaps to get to these airports, and at other times they will have to remain at an altitude before letting down to enter these airports which will add to their pilot duty time, increased fuel, and scheduling. SO-6

Our industry remains fragile since 9/11 and our goals should be to encourage the use of our nation's airports and accommodate all of the aviation users. We recommend that you look to expansion in North and South Dakota, and we thank you again for your service. PN-2

HEARING OFFICER GREGORY: All right. Thank you. Scott Newpower. Mr. Newpower.

2118

MR. NEWPOWER: My name is Scott Newpower,

2118 (cont'd) Page 48

N-E-W-P-O-W-E-R. I'm the Eastern Director for the Montana Pilots Association. And we had a meeting -- a regularly scheduled board meeting 10 days ago and that was on our agenda, and we will be submitting written comments in opposition to the expansion.

One of the things we've heard from the air taxies, not only in eastern Montana but western Montana, is IFR overflights. The FAA, it's either hot or cold. If it's hot, nobody's going in there. And that's just dealing with the airports in the proposed expansion area.

Overflight aircraft, pretty much anybody going east to west can't go through the area if it's -- if it's hot. So that's a concern that they've expressed to us.

AM-21

And as Debbie mentioned, we have the Hays MOA and it happens right now. If it's hot, you're not going through there if you're IFR. You have to go around. And with this airspace being four times bigger than what it currently is, that's gonna be a problem. That's what we're concerned about. Thank you.

AM-6

HEARING OFFICER GREGORY: All right. Thank you. Mr. Wade Cebulski.

MR. CEBULSKI: You got that correct, too,

Colonel.

HEARING OFFICER GREGORY: Excellent. I try to help.

2119

MR. CEBULSKI: Okay, thank you. My name is Wade Cebulski. That's spelled C-E-B-U-L-S-K-I. I'm from Seeley Lake, Montana, so I made a pretty good trip, too. And I'd like to comment on you making such a long distance travel from South Dakota.

One thing that surprises me is how emotional it is here. I didn't anticipate that. So that is quite eye opening.

So anyway, I'd like to introduce myself. I'm the President of the Montana Pilots Association which is about 700 members strong. And like Scott said, being our Eastern Director, we had a board meeting in which this was on our agenda. But previous to that meeting, I'm also the President of the AOM which is 13 private -- or pilot organizations from the State of Montana. And I'd like to just kind of read you a list. And I happen to be President of that, too.

And, of course, I'm from the Montana Pilots Association, Montana 99's is represented, Montana Flying Farmers, the Experimental Aircraft Association -- and I will state, that's Montana, not

national -- the Montana Community Airport Association, Montana Aviation Trade Association, Association of Montana Aerial Applicators, Montana Airport Managers, Montana Antique Airplane Association, Montana Seed Trade Association, the Civil Air Patrol, the AOPA, and Montana Aeronautics Division. That's all parties.

Of all of these organizations, there was nine present at the board meetings that we had here within the last two weeks.

And I don't think I have to set here and say that, because there's been a lot of good testimony so I'll just be repeating myself, but we are gonna make a written comment, and it was unanimous of all the people present that they were not in favor of this. And I think that covers a huge portion of the -- of the general aviation pilots and commercial operators in the State of Montana. GE-2

And like Scott says, the biggest thing that I hear is a lot of IFR guards are worried because the first thing that happens -- like at Hays MOA, these craters and stuff go up here, what happens is, even though it's -- the Air Force says it's okay, the FAA could run you through there, but what happens is, when it's hot they can't go IFR, so what happens is, AM-21

2119 (cont'd) Page 51

they have to cancel their IFR clearance and go through as a BFR pilot. So that limits up to 18,000 feet or less.

AM-21

And then secondly, it's see-and-avoid. Well, I'm pretty much a BFR pilot. And, you know, if someplace is active and these guys are cruising all over with the multitudes of aircraft, especially we're talking some rather big amount of aircraft here now with these LFEs, you know, it's probably just not real brainy to go into an area when you're talking that kind of speeds and stuff.

SA-7

And so anyway, I guess what I'd like to say is, there seems to be a lot of emotion here and I don't hear much in favor, and I'd like to say that it was by our vote that we just as soon that it stayed the way it is with the current situation that we have, and we hope North Dakota and South Dakota benefits well from this because that's where we hope it stays. Thank you.

GE-2

HEARING OFFICER GREGORY: All right. Thank you. Mr. Doug Braun. Mr. Braun.

2120

MR. BRAUN: My name is Doug Braun, B-R-A-U-N. And I'm gonna really -- I'm gonna probably piss a lot of you people off.

I'm a Navy Vietnam veteran and I am really

2120 (cont'd) Page 52

proud of my country. I hear all this whining. I'm a rancher. I have a ranch over by Red Lodge. And I hear all this whining and whining and whining. It about makes me puke.

We have a real serious problem in this country, and it's not the Air Force flying around making a little noise, it's Muslims. This paper come from Spokane, Washington, two weeks ago. This guy, this car bomber, it says here, he says -- he got life imprisonment.

It says, "Brace yourselves because the war with Muslims has just began," Sheza Head or whatever said. He said, "If I'm given a thousand lives, I will sacrifice all of them for the sake of Allah." And then again he says, "Brace yourselves because the war with Muslims has just begun." In other comments, he brushed a question from a judge about the oath of loyalty he took. He says, "I did swear, but I didn't mean it."

I go all over the United States. I collect antique cars. I stay on Air Force Bases; proud to wear the Air Force shirt. The Air Force is -- they treat their guys nice. When I was in the Navy, they didn't treat us that good. You get a nice room for 39 bucks all over the United States and it's safe.

When I travel, I stay a lot at -- you probably don't know the Stealth Base, Knob Noster, Missouri, where the stealth bombers are kept. I've been there quite a few times. And Wright Patterson in Ohio and as well as North Dakota, Travis. I've been all over. And I'll tell you, we -- this country was founded on Christianity, not on Musliminity. The damn Muslims.

I'm so -- I'm really -- I'm really ticked about all this stuff. They invade our country and, you know, we got a -- we got a supposedly Commander in Chief who I despise that has Muslim ties.

And you folks had better wake up because here in Montana it's nice. It's nice to come here, sit in this hotel, you know, have this meeting, nobody messes with us. But I'll tell you, we got a problem worldwide, nationwide, and it's -- it's just gonna get worse. PN-3

So I probably ticked a lot of you people off, but that's just the way it is. I'm damn proud of my country. And I guess I won't have to worry about it, you know. I'm at the end of my life.

But I'm a hundred percent in favor of the Air Force doing their training or whatever they gotta do. If we gotta put up with a little noise, my cows, didn't bother them any because they flew right GE-1

over my ranch. GE-1

So I don't know. I just don't know what to tell you. I'm pretty -- I'm pretty wigged out of shape about this whole situation.

You know, our future generation, they're gonna have real serious problems. So I'm just a hundred percent in favor of the Air Force and whatever they want to do. GE-9

My kid went to the Academy. My friend Florence, her son just made Lieutenant Colonel, you know, and I'm proud of them. I'm proud of all the vets and what we've done.

So that's all I got to say. And if I've offended any of you, I guess I'm sorry. It's too bad. This is America and we really gotta watch out what's happening. Thanks.

HEARING OFFICER GREGORY: Ms. Liz McFarland. Ms. McFarland. 2121

MS. MCFARLAND: Thank you very much for the explanation this evening. I thought that was very good. And I appreciate the Air Force being here and explaining their proposal and the Air Force contractors and whatnot.

I guess by way of introduction, I'm Liz McFarland. My husband and I are landowners in

2121 (cont'd) Page 55

Powder River County. We both ranch and that's partially how we make our livelihood.

I did comment on the proposed action, let me see, whenever that was, several years ago in the summer. I attended one of the hearings. However, I did not receive a Draft for whatever reason. But that's okay because I've got this now so that's taken care of.

But because of that, I have not had time to read the Draft, so I'm going to kind of list my concerns having not read that Draft, which are:

I am concerned about the general aviation. I am concerned about firefighting responses and conflicts there. I'm questioning the agreement with the BLM, the MOU. I'm concerned about emergency responses. I'm certainly worried about the noise and the effect of noise on our livestock operation. I'm concerned about the chaff and the flares. I'm worried about our property values, the quiet rural attributes that we currently have in our neck of the woods that make it so wonderful, at least in my opinion. I'm concerned about the visual effects of large aircraft flying about and overhead. I'm concerned about safety. SA-5 BI-2 SA-26 SO-1 LV-9 SA-1

I will be submitting written comments. And I

2121 (cont'd) Page 56

would also very much like to incorporate the comments of the second speaker, the speaker from South Dakota, and Ms. Alke into my comments.

I'm not -- I certainly -- you know, in looking at the fat Draft, wherever -- whoever held that up, since I haven't had time to read that yet, I do think this is a very, very complicated topic with lots of acronyms and lots of stuff to understand. I -- I -- I just don't -- I'm not astute with the military airspace and this height and that height. That is very confusing to me. And so I think this is just a very hard thing to understand and to understand how those effects will influence the things that I've brought up. DO-1

Anyway, I will be submitting written comments. And I would like to say, in general, I am opposed to this. GE-2 I am perplexed to understand why this isn't -- I guess I really don't believe you've made the case to have a change in venue. So I'm still stuck on the proposed action, that I really don't understand what is it. I'm not -- I just haven't been convinced that you've made the case to change that venue and the necessity of that from the multitude of places where you're currently training. PN-3

And having said that, I'd also say that I'm --

2121 (cont'd) Page 57

I'm also not convinced or I don't get why isn't -- you know, why it is you're moving over to Montana as opposed to the communities that would serve -- or collect the economic benefit from the proposal. PN-2

Anyway, with that, I will be submitting written comments, which I will also be forwarding and commenting to all of my congressional representation. And I do hope this goes away unlike the speaker before me.

HEARING OFFICER GREGORY: All right. Mr. Richard Bush. Mr. Bush. 2122

MR. BUSH: Bush. That's B-U-S-H. And I appreciate all the kind comments about the Air Force, having been a former Air Force Interceptor Pilot a couple of careers ago.

A few comments just in regard to that. I was very grateful to have the opportunity to have low-altitude flight training and I also was instrumental -- instrumental may be too big a word. Myself and one other guy when I was a Captain, we worked to establish a low-altitude flying area at the Air Base that we were at, and we did everything from go out and sit in the -- in the mink ranch while the mink were mating to see if somebody would -- if it was going to disturb the mink mating

Powder River - Billings 10/26/2010

2122 (cont'd) Page 58

when airplanes flew over to speaking at venues like this.

You know, a couple of comments based on that experience. First of all, I sort of decry the "not in my back yard" attitude. I recognize that Ellsworth Air Force Base is in South Dakota. I flew all over the country and trained in all kinds of airspaces that weren't part of the Air Base that I was established at, from Panama City, Florida, to Nellis Air Force Base to wherever. PN-2

And actually I flew -- at the time I flew F-106s which used to be established at Malmstrom. It hasn't been mentioned here, but I would assume that, you know, if need be, and I know the Malmstrom mission is changing, but those aircraft could probably use this or might be engaged in that airspace.

So, you know, I think, you know, we're a little bit short-sided and parochial in our -- some of our look at this -- at this establishment.

So in general, you know, I think it's a good thing. I think -- I haven't read the study, but I would expect, given the time line and what I went through more than 25 years ago doing the same thing and with all the regulation we have now, that GE-1

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2122 (cont'd) Page 59

they've probably done a pretty thorough job on that.

A couple of things I would be concerned about: the IFR restrictions. I mean, I'm all for economic development, and I would see that the biggest risk is the restriction on IFR flight through this place, through these places. Because, you know, generally, you know, those kinds of -- the airlines and carriers and those people don't generally fly VFR. So if they're restricted, that's gonna impact development, whether it be taking bull semen somewhere or flying in a head for an oil derrick. Those are the kinds of things that, you know, we oughta be concerned about. SO-7

I would ask for more information on the large force exercises. How many airplanes are we talking? I mean, I've been part of large force exercises where we've had -- well, if you went to -- if you've seen, you know, the Nellis Air Force red flag exercises, I participated in many of those. You know, you got hundreds of airplanes flying around. I don't think we're talking about something like that, but are we talking 10, 20 airplanes, those kinds of things. AM-27

So in summary, you know, in general, I think we ought to be looking at this as a -- as a national

2122 (cont'd) Page 60

resource, not so parochially. Therefore, I support it. I don't give a damn whether it's in, you know, Montana, South Dakota, North Dakota, Wyoming, wherever. And just with a couple of issues on the impact on economic development. Thank you. GE-1

HEARING OFFICER GREGORY: All right. Thank you. Mr. Glen, I'm at the last card and that's yours.

MR. GLEN: Thank you, Colonel, Major. I'm decidedly a minority in this group. First of all, I'm a 50-hour pilot so I don't have the expertise that you folks have.

2123

My name is Glen, G-L-E-N. First name is John. I'm not a Marine and I'm not a senator. But I'm gonna tell you, I'm here to say that I strongly support this MOA. And there's a couple reasons why I say that. GE-1

I don't own any ranch. I don't have any cows. I do have sage-grouse once in a while.

First of all, I read in the Gazette today -- and I was aware of this, this hearing, two months ago. And I don't know how I got that information, but it was out there. NP-8

But I read in the Gazette today that there will be six to nine low-level flights a year; that sonic

booms may be heard in a given area once every six years.

One of the ranchers has indicated, not here but in the Gazette, that his business was putting on weight on cattle. Well, the business of the United States Air Force pilots is training and preparing for our national defense. These are some of the reasons why I support this MOA.

Spending our tax dollars, time, and equipment to fly from Ellsworth Air Force Base to Nellis Air Force Base in Nevada is ludicrous. I realize that we have a lot of land in southeastern Montana and I own some of that. There's only one in a part of this new program, these new areas, that are in Montana.

GE-1

I think that by training our pilots for our national defense is a far cry from putting weight on cattle. Do we forget what happened in the second World War and how the population in general supported our Armed Forces? I think we do.

Pilots, the Air Force pilots are putting their lives on the line as they go into harm's way. And I think that they deserve every bit of training that they can get.

AUDIENCE MEMBER: Absolutely.

GE-1

2123 (cont'd) Page 62

MR. GLEN: I think that we can sacrifice -- if they can sacrifice their lives for us, we can sacrifice a few comforts, a few things that might cause noise. And I think the majority of our people think that way, just those that are not here think that way.

GE-9

The opponents to this MOA should truly be ashamed of themselves. I strongly support it.

HEARING OFFICER GREGORY: Is there anyone who filled out a card to speak that I don't have? Because as I said, that's my last card. Anyone? Anyone at all?

I've got about, oh, over half an hour before the hearing is scheduled to adjourn. As I mentioned, I'm going to recess the hearing in a few minutes. If you change your mind, all you have to do is come up and tell me, I'll turn the machine back on, and we'll get your statement.

But is there anyone at this point who already spoke who would like to add to their remarks? Like they say in football, I can put another three minutes back on the clock for you.

Mr. Kammerer, okay. Come on down. Mr. Dinstel, you'll be after Mr. Kammerer. Three more for Mr. Kammerer.

MR. KAMMERER: A couple of years ago people who are looking to develop wind energy -- we live in a very windy area. North of the Base are people that do quite a bit of farming/ranching and they were approached and even went so far as to sign papers where they had a down payment so that these companies could tie up areas for potential wind farms. This proposal chilled any more of that activity. SO-17

And let's keep in mind that these wind farms, we developed the technology because it will be -- it's coming. That kind of technology can bring in -- they're talking about jobs at Ellsworth? This thing can bring in more jobs than that ever thought of and it will be clean energy. SO-17

This proposal killed that concept. And any time someone wants to come in and put in a wind farm -- and they got these big high ones. They're not talking about these little fellas setting right along somebody's house. Those people, they're not going to have to come -- want to come out here and fight with the Air Force.

There's 30 to 40 different airports in this whole given area and there's hundreds of people who aren't even reg -- have their planes registered, SO-15

2116 (part II cont'd) 10/26/2010

Powder River - Billings

Page 64

they got ultralights, whatever, going out in the morning to check the pasture to see if the coyotes got in the sheep. If the Air Force says they can't fly, B-1s are coming through, who's gonna pay for them sheep that the coyotes are eating? I don't buy it. SO-15

Colonel Hackworth used to write editorials, one of the experts on defense, most decorated man alive at that time, I know him or knew him, he's dead now, stated and warned again and again what Eisenhower was trying to warn us about and what McCarthy was trying to warn us about about the competition between the Air Force, the Navy, and the Army for the resources that are available and not even available.

I think we have to have a real debate on the military budget. We are approaching, fast approaching a trillion dollar budget when you include everything. And these -- these young men and women who are serving in this -- in our forces deserve better than what we've been giving them in the last few years. SO-14

Let's not go looking for wars to fight. Let's use our heads. And let's not abuse these young men and women and some of them not so young. Let's see GE-6

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2116 (part II cont'd) 10/26/2010

Powder River - Billings

GE-6

that they're well taken care of when they come back, but let's not willingly use them and misuse them. They deserve better than that, and so do we.

HEARING OFFICER GREGORY: All right. Thank you. Thank you, sir. Mr. Dinstel, come on back. Another three for Mr. Dinstel.

2113 (part II)

MR. DINSTEL: Yeah, I'm Del Dinstel. And I get damn tired of getting beat up for not being patriotic enough. If this -- if this benefits South Dakota for this many million, 324 million per year, where the hell is their patriotism?

My grandfather was -- served in World War II and my old man was sitting on Okinawa when Truman dropped the bomb on them. He went over and disarmed them. Later on he served in General Douglas MacArthur's Honor Guard, stood outside the door of Douglas MacArthur. I just took him -- he's 88 years old. I took him down to St. Louis, Missouri, so he could go to his reunion, his Army buddy reunion. And he falls asleep in the airports and he doesn't always wake up in time to get his connecting flight and that's why I took him down there. They're down to 20 of those guys that served in there. They're dying pretty fast.

I also had a neighbor kid in Colstrip that --

2113 (part II
cont'd) 10/26/2010

Powder River - Billings

Page 66

Trevor Johnson was his name, was in the same grade as my daughter, and he's -- he used to go to high school games after -- he had to drive back out in the country in the evening, late in the evening, so his parents would have him stay over at our house. Hell of a nice kid; slept on our floor in the family room. He was blown up by an IED over there in Afghanistan.

I respect what the Air Force does, but they don't have as many casualties as the Marines does. Trevor was a Marine. If you want to, you can -- you can certainly drop a bomb on that son of a bitch that made that IED for Trevor, so...

But -- so I'm getting damn tired of getting beat up for not being patriotic enough. And al-Qaida as far as I know is the enemy. They don't have radar. We don't have to throw out any chaff for al-Qaida. They don't have surface-to-air missiles. They don't have interceptor aircraft. So I would like to see that the money that is spent on the B-1s go to guys like Trevor so that they -- they don't come back in a box. Thank you.

PN-3

HEARING OFFICER GREGORY: All right. Thanks. Anyone else who has already spoken want another three minutes?

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

Well, like I said, I'm going to recess the hearing. If you change your mind, want to make a comment, Teresa and I will be sitting up here at the table. All you have to do is come up, let me know you'd like to make a comment, I'll reconvene the hearing, turn the machine on, and you can make your comment.

In case I don't talk to you again, let me give you some concluding remarks here. The FAA and the Air Force reps, they're back in the back, they'll be standing by those boards and various displays to continue discussing this with you.

I want to thank each of you for coming out tonight for this Powder River Training Complex EIS proposal and participating in this hearing. As I've mentioned several times, tonight is not the end of your opportunity to participate. Those written comment sheets that are available at the registration table where you came in, you can turn these in tonight at that table, take them with you, fill them out or type a comment, as I said there's no page limit on written comments, and either mail or fax them later. And again, the mailing address is on both the brochure and on the written comment sheet.

The Air Force welcomes public comments at any time during this Environmental Impact Analysis Process, but let me foot stomp this. To be considered and become part of the Final EIS, please get your comments in by November the 15th, 2010.

If you'd like your own copy of the Final EIS, tell one of the representatives at the table out there or send a letter or postcard asking for your own copy and the Air Force will send a copy of the Final -- let me wrap this up and I'll get right back with you -- the Final EIS to you. Did you --

MR. KAMMERER: Are you sure it's not the 13th? That's what they told us at Rapid.

HEARING OFFICER GREGORY: Well, I saw in the newspaper today they had the 13th, but after that was published at Rapid, it looked like the 15th was the date, so you've got until the 15th.

Let me ask the Air Force legal adviser. What is the final date? Is it the 15th?

MR. MILLER: 15th of November.

HEARING OFFICER GREGORY: 15 November.

MR. KAMMERER: They told on Jim Thompson's talk show and he -- Colonel Taliaferro, and he said it was the end of the month. So I'm getting very confused.

HEARING OFFICER GREGORY: Well, what's formal and what's right here and what I'm putting out, and I'm hearing it from the legal adviser, November the 15th, 2010. And if somebody wants to tell me different, speak now or forever hold your peace. November the 15th it is. All right.

AUDIENCE MEMBER: I know this is not a question and answer, but what's the FAA deadline? Because they're also taking comments.

HEARING OFFICER GREGORY: Boy, I have -- Pete, is there a deadline for comments on you guys?

MR. LEHMANN: There is. I don't know what it is offhand. It's for the aeronautical. It just actually got served.

HEARING OFFICER GREGORY: Can you check on that and get back to this gentleman about that?

MR. LEHMANN: Yes, I will.

HEARING OFFICER GREGORY: Give him your card.

All right. Well, I'm going to recess right now. And again, if you change your mind about wanting to make an oral comment here tonight, all you have to do is come up here and tell me. Teresa and I will be here until 8 o'clock. Just let me know. So for now we're in recess. Thanks again.

(The hearing in recess at 7:34 p.m.)

HEARING OFFICER GREGORY: This hearing is called to order. Mr. Kammerer wants to add to his remarks. Sir, go ahead. 2116 (part III)

MR. KAMMERER: I have a letter in my possession from Colonel Taliaferro talking about chaff, and he stated in there that chaff would not be eaten -- was not liked by livestock unless they laced it with molasses. Well, you're not going to be dropping that out of airplanes laced with molasses. SA-14

So it falls down on my grass. It's not palatable material. What's that going to do to my grass? Isn't that like peeing in my drinking water? I mean, it's all -- everything has an effect.

And that just, you know, that -- and these -- and these flares are scary. That's why they don't have much trouble. But I've gotten this from the Center for Defense Information out of D.C. Admiral Carrow used to be Commander of the Navy. We had him there for a conference. He's dead now unfortunately. But he said this isn't all necessary. SA-5

I've got in my possession -- and he was the one that helped start this Center for Defense Information, him and Admiral Rickover and some others. And, you know, I trust these people.

2116 (part III cont'd)10/26/2010

That's the only outfit in D.C. I do trust. Retired Military Brass.

But I think that, you know, as he said -- and I've got this tape where it shows in Mountain Home prairie fires are going. And it states right in this book here, you know, we've had them first meetings, well, there are some flares that do go to the ground. Maybe they don't start a fire right then. They might later, or they may go ahead and start a fire.

And when you're out in these huge open areas like Ellsworth, forget them. They don't know how to fight prairie fires anyway. We proved that here about three years ago when they was playing around with munitions up there on their -- on their firing range, or whatever, and a fire started and sniffed out wind. It burned three miles so damn fast. The best Fire Department in South Dakota setting right up there, it was us local guys with our little pickups and pumpers that put that damn thing out.

So the flares are -- we've had two different fires come out of the Air Base where there used to be a horse pasture. They bought this other perimeter around there. And old lady Ellsworth, the General's wife, that was after he died, but got the

SA-5

2116 (part III
cont'd) 10/26/2010

Powder River - Billings

Page 72

stables started out there. And they used to ride and we've had two different fires come out of there.

Prairie fires are not -- are not fun. And they come within a quarter mile of my house, my yards. So, you know, we have reason to be very skeptical about, you know, burn -- if you burn off thousands of acres, who's going to compensate you in time to buy feed to get your livestock through another season? It's a dangerous exercise. SO-12

But anyway, that's -- that's what I wanted to add to it. And I will submit a written comment.

But a lot of these old boys out here, I would say 90 percent of the people out here don't even know this is going on in this whole given area, all these areas. I would submit that. They don't have a clue yet. They're just starting to hear about it. And they aren't prone to sit down and write out things. I mean, a lot of them are old guys like me. Christ, I'm 74 years old, you know. I don't want to be messing around with that kind of stuff. I want to be out there doing something. I don't want to be setting there writing something out. I have better use of my time. NP-8

But I'm going to protect that land. It's a resource to me and my family. And all of this is a LO-1

COURT REPORTING SERVICES - TERESA L. FINK, RMR (605) 718-1107

2116 (part III cont'd) 10/26/2010

Powder River - Billings

resource to all of us because it feeds us and provides nature for those who don't like to hunt. Those who like to hunt, it provides all of these things. It's a gift. Let's not take it lightly. LU-1

(The hearing in recess at 7:37 p.m.)

HEARING OFFICER GREGORY: The hearing is called to order. Ms. McFarland wants to add to her comment. Please.

2121 (part II)

MS. MCFARLAND: So my other concern is that this is an open-ended proposal and that there's no discussion about when it might come to a conclusion. So once it's designated as the training space, I don't know how we would ever confer to change it or make it go away, and that's a concern for me as well. Thank you. GE-10

(The hearing in recess at 7:40 p.m.)

HEARING OFFICER GREGORY: The hearing is called to order. The time is 8 o'clock. During the recess we had a couple of additional comments which are identified in the record and the hearing was convened for each person to make their comment.

And there being no more speakers, the hearing is adjourned.

(The Powder River Training Complex Public Hearing adjourned at 8:00 p.m.)

STATE OF SOUTH DAKOTA)
) SS. CERTIFICATE
COUNTY OF MEADE)

I, Teresa L. Fink, Court Reporter and Notary Public, South Dakota, certify that the foregoing Pages 1 through 73 are a true and correct transcript of the proceedings had.

I further certify that I am not related to, employed by, or in any way associated with any of the parties to this action, or their counsel, and have no interest in its event.

Witness my hand and seal at Summerset, South Dakota, this _____ day of _____, 2010.

_____
Teresa L. Fink, RMR
Registered Merit Reporter

My Commission Expires: 4-29-2016

And with that, I'll ask if anyone would like to make a statement on the record here today. Just raise your hand if you do.

CHAIRMAN KECKLER: Sir?

HEARING OFFICER GREGORY: Yes.

CHAIRMAN KECKLER: I spoke with one of the ladies there. The 15 gentlemen that are sitting here -- or ladies and gentlemen are Council representatives. As a result, I will provide you with the sign-up sheet from the Council and that will work for the 15 seated in this area and them comments will be made as part of the Tribal Council. So the ones that are not part of the group sitting here, then you can fill out them forms. But the others will be part of the Council and the correspondence will come back to here.

HEARING OFFICER GREGORY: Sounds good. The cards are mainly just to identify who's doing the talking. It's for the record.

CHAIRMAN KECKLER: Okay. What I've got, is I've got Steve Vance first and then I've got Bryce, so if you don't mind.

HEARING OFFICER GREGORY: Wherever they want to speak from. Sure.

MR. STEVE VANCE: (Speaking in Native Lakota)

Greetings to everybody. My name is Steve Vance. I'm with the Tribal Cultural Preservation Office. I carry the title of what they say THPO, Tribal

2143 (cont'd)

Historic Preservation Officer.

I would just like to remind Council and public and Ellsworth, Langley, you know, the Air Force, that right now we're making comment on the effects to Cheyenne River. That is our boundaries. But what I've come to find in working with Cultural Preservation is that we've been invited outside of our jurisdiction for comment, and this is why I want to remind everybody that traditional ancestoral territories of the Lakota goes from the Big Horn Mountains to the Mississippi River, from parts of Canada to Oklahoma. So we have ancestors who are buried in Wyoming, Colorado, Montana, Minnesota, Nebraska.

So through our program, we're invited outside of our jurisdiction to make comments of adverse effects, and this is what comments from Standing Rock have made of -- I was gonna like maybe like give a little scenario or example I was thinking, but I would probably get hauled out of here by Sergeant At Arms.

While all this was going on and the video and

stuff, I kinda picture that maybe if I sat back here with a little remote control helicopter and let it buzz around in the corner here while everybody is trying to paying attention. The reason I'm saying that is because that's a visual effect. Even though you're trying to pay attention up here, you see

LU-9

2143 (cont'd)

something off to the side that draws your attention.

These are some of the comments made by Tribes of the effects. I mean, we're talking about environmental, but sometimes, you know, Lakota people, you have to remember on a traditional site, is this nature is why we're here, the sun, the sky. We've made these comments when it comes to the wind turbines or to the cell towers. If a -- if a man or a woman is hanbleca'ing and they're sitting there and they're looking off into the distance and here's this big wind turbine turning in front of them before the sun rises, it has an effect to that person. Those are the cultural, what they say the traditional cultural properties of where a person will take that time.

LU-9

NA-5
NA-7

But I just want the public and Council also to remember, you know, this is -- you know, it's above us. It's not where we're standing, but yet it has the same effect because you gotta remember where our

ancestors are, where they are. Our children, our grandchildren will be wanting to know that information.

So I just want to remind everybody that through our program, you know, we are addressing these issues. Our program is not the final say-so in the EIS. It is you 15 and executive here who must represent the voice of the people. This is why we brought them here. And I wanted to make that

comment, you know, that it is you who make that decision for Cheyenne River. (Speaking in Native Lakota)

2124

CHAIRMAN KECKLER: Bryce.

MR. IN THE WOODS: (Speaking in Native Lakota) Greetings to you, the U.S. Air Force. I'm Bryce In The Woods. And I just greeted you in saying that the air and the land and we call it Mni Wiconi, the water of life, and we hold these things to be sacred.

In that treaty area on that map, this is where all the fly zones are, in the 1851 treaty. And you see our 1889 Act as a Cheyenne River Sioux Tribe which to me is not the truth. And we want to speak the truth today.

And I said that our men and women here are

standing in the front lines over there in two wars, standing there soldiers defending this country, our country, and I asked the elders to speak. That's what I said in Lakota.

To me, I just got elected again as a committee chair, chairman, and it's been kind of difficult because I know the truth. I study our history and the truth is always on our side, not the United States, and you're asking to expand into already 1851 treaty territory. You're already doing that.

I have one complaint. A while back, I believe in '98 or '99, I live in a community about 20 miles

AM-15

2124 (cont'd)

Powder River - Eagle Butte.txt

from here, Dupree, there was a B-1 that flew and made a mock drop on us. They made all of us that were in our house come outside because there was a sonic boom. And when I got out, I seen it turn around heading back towards Ellsworth.

So I called the Chairman up, and he is sitting here now, but it was under his administration, I called him. I said, "Do you know what they just did? I don't appreciate it because it got a lot of people shook up," you know. And I wanted to file a complaint against Ellsworth or whoever that pilot was that did that or whoever gave that order for them to do a mock drop on us. I don't like that.

AM-15

COURT REPORTING SERVICES (605) 718-1107

38

That wasn't funny. And that's one for the record.

And the other thing went back to our water of life which is being desecrated and polluted for over 100 years now. That's a major concern.

PR-1

And then that area that you're expanding on to the Cheyenne River on our northwest and into Standing Rock, that's the grasslands. Those are grasslands where you guys are -- right on that corner there. And to me, it would be detrimental if one of those flares come down and start a fire in those grasslands. I don't know if that's taken into consideration, but that's for the record.

SA-5

And I personally, I oppose Minot and Ellsworth expanding. You guys are already in our treaty territory unwelcomed, you know. And I'm not

GE-2

Page 34

2124 (cont'd)

opposing the military. I'm not, you know. I'm a U.S. Army veteran and I served honorably. But when you look at the treaty side of this, which has always been ignored and always been violated, you know, that airspace belongs to a people. And just that one comment I made, you know, that mock drop, it was very disrespectful.

NA-8

And I would like to reserve some comments, but I oppose any expansion. You guys are already in the treaty. You are already violating airspace.

And at one time the relationship between the U.S. military and the Lakota people was a good relationship until they discovered gold in the Black Hills and then that relationship turned under U.S. government President Ulysses Grant. And some of the presidents -- some of the generals that were in this area, one of them particularly related when questioned, "What about the women and children?" and he said, "Exterminate them all." Children are like make nice. They all have to be exterminated according to this general.

And that -- when I read those things, it's all part of history. But those things are still a reality for our people here, you know, coming to a friendship relationship with the United States and with the military, and then during a period of outright general extermination on this what we call these sacred grounds and the water of life. There's

2124 (cont'd)

a lot of -- a lot of bodies out there because of these killings that happened during that time and they're scattered all over, what they call the Great Sioux Reservation. And that's what Mr. Vance mentioned from the tip of the Big Horn Mountains to the east bank of the Missouri River.

And those acts that changed it, 1887, '89 that

brought us to the 102nd parallel where you're coming in now, we already had the 104th and the 103rd and now we're at the 102nd and you guys are coming into that zone. And, you know, I say a prayer for our -- our men and women that are in the Armed Forces and are over there in Iraq and Afghanistan and all over wherever they're stationed. We lost two, two here to those wars.

So with all due respect, coming from a historical perspective, is that I hope you hear us when we say we don't need that expansion. You guys have always done that. You guys have always -- you know, another story would be coming back from Fort Peck and we was landing over here in the airport and a B-1 flew below us and I told the pilot, "Did you see that?" He said, "What? What? Where?" I said, "Well, it already went by, a B-1," when I was coming into this airstrip out here a couple years back. So -- and you can see the afterburners at night, you know, when they go. If you aren't familiar with that, it will make you stop and see the afterburners

2124 (cont'd)

on the B-1s at night.

So, you know, that expansion, I kind of oppose even the drones, you know. That's the economy for Senator Thune and the congressional people here want

SO-25

to keep Ellsworth alive. Because Ellsworth almost went under a couple times. But you guys got in that fighter wing and now I think you're bringing in the drones. Where are they gonna fly?

AM-17

And one thing about the Air Force when they're overseas in combat zones, there's always collateral damage. There's always old people and women and children that get killed indiscriminately. And that's the truth. You know, let the truth be told.

So any more expansion into our territory, I stand opposed to it. I think you guys already, you know, are doing what you will, but for the record, I stand opposed to your expansion. (Speaking in Native Lakota)

2125

CHAIRMAN KECKLER: DeAnna.

MS. DEANNA LEBEAU: Thank you, Mr. Chairman. Good morning. My name is DeAnna LeBeau. I'm one of the newly elected Council representatives that Mr. Vance was referring to. I'm from District 6 on our reservation.

I would like to say good morning to the officials that are here today. Good morning, Colonel Gregory, Colonel Eldridge, Ms. DeVine. Thank you very much for being here.

2125 (cont'd)

I have some questions I would like to ask you.

I'd like to get a clarification. You said that you're here today because of the requirements under NEPA; is that correct?

MS. DEVINE: Yes, ma'am.

HEARING OFFICER GREGORY: Yes.

MS. DEANNA LEBEAU: Okay. So I understand that you have to take public comments, those are all part of NEPA requirements, but I guess please just clarify this for me, can we say no? NP-1

HEARING OFFICER GREGORY: You can make any public comment you would like, but this is not -- the decision-maker is ultimately FAA, correct?

MS. DEVINE: Yes. The Secretary of the Air Force level.

HEARING OFFICER GREGORY: SECAF. The FAA controls the airspace.

MS. DEANNA LEBEAU: Okay. But I mean --

HEARING OFFICER GREGORY: But certainly you can make a comment as the other gentleman did that he is opposed. Certainly.

MS. DEANNA LEBEAU: No, I understand that. That's what I was saying, can we say no.

HEARING OFFICER GREGORY: You can say no for the record and that would be considered.

MS. DEANNA LEBEAU: Can we forbid you from NP-1

2125 (cont'd)

being in our airspace? We cannot; is that correct? NP-1

HEARING OFFICER GREGORY: The FAA again has control of the airspace, right.

MS. DEANNA LEBEAU: Okay. The other thing you were talking about with this chaff, you know, I understand you said that the probability of it starting a fire is low, but if it did start a fire, who puts it out? I mean, other than the fact that our local fire department's gonna respond to any fire emergency, but, you know, would you in fact be responsible for that, too, if it was determined that indeed the chaff did start a fire? SA-5

MS. DEVINE: Actually the flares --

CHAIRMAN KECKLER: Can you come up and speak into the mike when you're asked questions, please?

MS. DEVINE: Do you want to address the questions?

COLONEL ELDRIDGE: I think you understand the legal.

MS. DEVINE: Okay. The chaff would not start fires. The flares would be above the 2,000 feet. And what Ellsworth Air Force Base would do would be to have agreements with local fire departments and -- you know, to do the immediate response, the Forest Service and the same as wild fires are today.

If there is damage caused by a fire, then you would submit a claim through the Ellsworth Air Force Base

2125 (cont'd)

Public Affairs Office and document that.

MS. DEANNA LEBEAU: Okay.

MS. DEVINE: And they would start the process.

MS. DEANNA LEBEAU: Okay, thank you. I was looking at this map, too, and I just have a couple questions. I'm just curious. The one that you handed out to us. I see there's a bunch of little arcs on there and some of them seem to be close to cities, such as Sheridan, Gillette, Dickinson. How come there's these little arcs that are carved out?

MS. DEVINE: Little round circles?

MS. DEANNA LEBEAU: Yeah.

MS. DEVINE: Okay. That is airspace that is for the major airports, and that is their approach and departure corridors. So those arcs around it are 35 miles around some of them and that's dependent on the size of the aircraft into and out of the airports. So that is protecting for flight safety the commercial airports.

MS. DEANNA LEBEAU: Uh-huh, uh-huh, okay. And so the part where you're actually gonna be entering over Cheyenne River is just a little -- it looks like the northwest corner of Ziebach County; is that

correct?

MS. DEVINE: Yes.

MS. DEANNA LEBEAU: And that was part of -- what did you call them? There was Powder River 1, Powder River --

2125 (cont'd)

MS. DEVINE: 4.

MS. DEANNA LEBEAU: So --

MS. DEVINE: It is Powder River 4, correct.

MS. DEANNA LEBEAU: So eventually it would encompass this whole area; is that correct? If the -- if that's what the FAA approves.

MS. DEVINE: Yes. The area that is underneath. There's four individual Military Operation Areas, 1, 2, 3, and 4, beginning from the west. I should have gone this way, I think. (Indicating)

MS. DEANNA LEBEAU: Okay. All right. You know, I think, you know, what they're doing, I guess this is my public comments, Council, you know, is of paramount importance, you know. I understand, you know, what my colleague said over here about our ancestors and, you know, if it wasn't for all them, you know, we wouldn't be here. The amount of territory that we've managed to retain, you know, we need to hold on to as stridently as we can. However, I always feel for my own self, you know,

that we need to think about our future. You know, we need to think about culturally, you know, seven generations ahead of us. I feel this is very important, especially, you know, for our troops over in Afghanistan.

One of my relatives and a close friend of mine actually, too, she lost her son over there. So I think it's real important. Thank you.

Powder River - Eagle Butte.txt

CHAIRMAN KECKLER: Thank you, DeAnna. Council Robin?

2126

MS. ROBIN LEBEAU: Thanks for coming. My name is Robin LeBeau. I am a District 5 Council representative for the record.

I've been following this for -- since they proposed this in Dupree, South Dakota. They came for a hearing there. I stood opposed against it then, and for the record I want to say what I am opposed to. I am not opposed to -- against the military and all the efforts that are being done there to protect our freedom here, but we also have to protect what's here at home for us. And there's -- there's a lot of issues and the one thing that I -- I did get a response back from Ellsworth Air Force Base on the minuteman missiles that were placed from here to the Black Hills, and they still

GE-2

COURT REPORTING SERVICES (605) 718-1107

47

stated that there is none located on our reservation. That's their word. That's not what I was told by my great-grandfathers. And my great-grandfather talked a lot about the sonic booms. He was a rancher north of Lantry there. He also talked about the Armstrong Gunnery Range. And until this day, they're still picking up 50-caliber shells there.

When my mom was little, they used to find live ammunition there. And I understand there's not gonna be any live ammunition, but I wanted to ask

Page 42

2126 (cont'd)

someone, the planning of this route, they told us this little portion here in the northwest corner of our reservation was just to -- for them to turn around; that these planes would be just for them. They wouldn't -- it would be a turn -- you have to have certain room because there's like a highway up there; is that correct? Is this just gonna be for so your planes can turn around?

COLONEL ELDRIDGE: I'm Colonel Bill Eldridge. I'm a pilot. The way the airspace is designed is so that we can do a lot of maneuvers, and a lot of those maneuvers involve a lot of turning airspace. Each of the sections is big enough, those four sections, and number 4 is touching up against your

Nation, would be used for doing a lot of turning maneuvers.

However, it's not to say that there might be aircraft going straight through there. But your Nation is sitting in the very, very corner so it's very hard for us to fly and stay over top that little corner. So it's kind of a difficult thing to answer. There might be aircraft going straight and level. There might be aircraft actually turning over that little point.

MS. ROBIN LEBEAU: Okay. My second question would be, according to this map, can't you move it further northwest so it's not even on that corner of our -- and again, I thank you for referring to us as

DO-7

2126 (cont'd)

Powder River - Eagle Butte.txt

a Nation because that's what we are. We're the Cheyenne River Sioux Tribe Nation.

COLONEL ELDRIDGE: And, ma'am, my suggestion to you would be to make that public suggestion. We'll put that on the record. Say there is a recommendation if you'd consider moving this border, this eastern border, and maybe it won't interfere with your Nation as much. I would just recommend that you put that comment in and the Air Force and the FAA will consider all those comments and come up with a decision.

COURT REPORTING SERVICES (605) 718-1107

49

MS. ROBIN LEBEAU: Thank you. I just want for the record that I am opposed to the Powder Bluff.

GE-2

CHAIRMAN KECKLER: Thank you, Robin. Maynard?

2127

MR. MAYNARD DUPRIS: Thank you, Mr. Chairman. My name is Maynard Dupris. I represent the District 3 area. I would like to ask the Colonels that are here, or I think there is a Major up there, I was in the military service also during the Vietnam War, my question to you people all is that, are you familiar with our treaties?

COLONEL ELDRIDGE: Sir, we've attended several of these hearings and a lot of them have included other Native American Nations, and during some of those hearings we've had some of the public comments talk about the treaties and address them.

But as far as, you know, other detail other than public comments that were referred to in those

Page 44

2127 (cont'd)

hearings, the federal government of course is familiar with the treaties, but I would say us as individuals probably could not speak to them.

MR. MAYNARD DUPRIS: Okay. The reason I ask that is because you're here for public comment from us, and as you all know, throughout the years, like Mr. In The Woods indicated earlier, that the treaties, we started out with a large land base and

it was downsized, another treaty and another act downsized down to our reservation here, and then the Homestead Act downsized it some more, so now we're struggling to keep whatever little Indian lands we have.

If you notice this map up here, all the yellow is deeded land and the tan or orange-looking is tribal allotted lands. So we're losing our lands gradually, gradually, and gradually.

And I really feel that the United States government is gonna do whatever they want to do. They come out here as a courtesy for public hearing, but if they want to take it like they have in the past over the many, many years they have taken our lands and we're down to, like I said, we're down to just a small amount of land that we have left. I am opposed to this also, and I really believe that this is just a formality that you come here to do this. But I think the FAA, they're gonna do whatever they want to.

GE-5

GE-2

2127 (cont'd)

And I hate to say that, but that's the -- that's the history of it all. The United States government has just been taking and taking and taking. And I feel that this is what's gonna happen again, but I am opposed to it. Thank you.

2128

CHAIRMAN KECKLER: Okay, Maynard. Merrie.

MS. MERRIE MILLER-WHITE BULL: Hello and good morning. My name is Merrie Miller-White Bull. I'm a District 4 Tribal Council representative and I represent about 1,400 voters on the Cheyenne River Sioux Tribe.

GE-2

And I'd like to say that I am opposed to this. I've always supported the military. I believe in our military and I know that they defend our country. And if there were ever a situation, they are the first ones on the scene. And a lot of young men and women have risked their lives for our country. But at the same time, I have to look at what's best for the people of the Cheyenne River Sioux Tribe and I took an oath of office. Just as the military takes an oath of office to defend their country, I took an office to defend the Constitution, the Tribal Constitution as well as look out for the best interests of the people of our Tribe.

And in my opinion, I'm usually forward thinking and I believe in economic development, I believe in our future and looking to the future and progress,

2128 (cont'd)

but at this point I keep thinking about our ancestors, the sacrifices that they made. I think

about our young men and women who have made sacrifices for the military. I think about the issues that have happened in the past. And I know we need to continue to look for the future and I know these are important things that the military is looking to do, but I think they need to look elsewhere.

PN-2

There is plenty of space. In my opinion, there is space elsewhere. We are a small Tribe. We are a poor Tribe. We don't have a lot of money. What we have is precious to us, whether it be land, whether it be air, whatever in our area, on our reservation, and we hold it very proudly and we're proud of what we've got. However little and minute it may be, it meets -- you know, it's for our people. And, if anything, I would hope that the United States government, the FAA, and the military will take a look at that.

EJ-2

So thank you, Mr. Chairman. I have to say I go on record as opposing. Thank you.

CHAIRMAN KECKLER: Thank you, Council. This is also for the public. Anybody who wants to comment, please raise your hand and come on up. Ryman.

2129

MR. RYMAN LEBEAU: Thank you, Mr. Chairman. My name is Ryman LeBeau, Council Rep for Cheyenne River

2129 (cont'd)

Sioux Tribe.

I appreciate you are folks coming out. My issue is similar to some of the other reps. I think it's insulting that whoever drew these proposals up didn't respect our airspace. And to -- to think that the Tribe wouldn't have a problem with this, you know, and just -- just draw this up and do it how we want and, you know, give them a hearing or, you know, take their public comment and be on their way, you know, I think that's very insulting to this Tribe, you know, considering what we've been through since the taking of the Black Hills and, you know, releasing our land and all the way to the Lawman Era.

NA-7

As another Council rep pointed out, our land is diminished within these boundaries, so of course we're gonna have an issue with this. And if we didn't speak out against this, we wouldn't be leaders. So in doing so, I do my job as a -- as a Tribal leader here. I -- I really oppose this and I think it's insulting to this Tribe. So I thank you for your time.

GE-2

CHAIRMAN KECKLER: Thank you, Ryman. Ardys.

2130

MS. ARDYS COOK: Thank you, Mr. Chairman. My name is Ardys Cook. I am Council Representative for

2130 (cont'd)

Powder River - Eagle Butte.txt

District 1. In District 1 are the communities of Dupree, Bear Creek, Iron Mining, Isabel, and Thunder Butte. The specific area that is identified on this map is north of Butte. I'm really concerned about the acreage of the -- on the map as to how many acres it's gonna affect. I don't see that on any of the maps where each area is contained to the acreage.

LU-6

I also would like to point this out, that there are -- on this map it specifically points out that the Crow Indian Reservation, the Northern Cheyenne Indian Reservation, the Standing Rock Indian Reservation, and the Cheyenne River Sioux Reservation are all identified. I'm wanting to know how the area was created.

I also believe that if the other Tribes had a hearing as well, I would like to read those or they be given to us because it affects our land. And one of the things is, is that one hearing was set in 2008 in Dupree, South Dakota, and there was very few people that attended because I don't think they realized or the word didn't get out like it should have as to the public hearing.

NP-8

The other thing is, I understand that there has been hearings within the Bison and Lemmon area and

COURT REPORTING SERVICES (605) 718-1107

55

NP-10

up in that corner, and I was wanting to know what their viewpoints were as well. Because I know that there was farmers and ranchers that held these --

Page 49

2130 (cont'd)

asked for these hearings and they view-pointed their concerns. NP-10

I also wholeheartedly respect our men and women in service and for the protection that they give us and they provide for us, that our families and our tiospaye is safe. But I do honestly believe that if this portion that is affecting the Cheyenne River Sioux Tribe can be moved further or taken off your map, I would respect that wholeheartedly because of the fact that we have ranchers and farmers up in that area, both Native and non-native, and that we do have a butte up there that we are very proud of, it's the Thunder Butte butte, and it is also used as -- for ceremonial purposes and we are very proud to have that butte in the northwest corner. DO-7 LU-1

So my question is, is how many acres this is gonna affect up in that northwest area. It's not identified. I think it should be identified. And I think that we should be given the amount of acreage that that corner is gonna be taking up. Can I get an answer to that today? LU-6

MS. DEVINE: Are you talking specifically on

the reservation?

MS. ARDYS COOK: Yes.

MS. DEVINE: Yeah, we would have to recalculate that.

CHAIRMAN KECKLER: Ma'am, can you come up here, please?

2130 (cont'd)

COLONEL ELDRIDGE: Let's just say, ma'am, we can't provide you an answer to that today. Again, we'll accept your comments and then those comments will be addressed and reviewed as part of the whole process. And then at the end of all that, you know, the FAA will make a decision. But we can't really answer it today.

MS. ARDYS COOK: Mr. Chairman?

CHAIRMAN KECKLER: Continue.

MS. ARDYS COOK: Continue?

CHAIRMAN KECKLER: Yes.

MS. ARDYS COOK: Also I would like to know what happened to the information from the hearing that you set up in Dupree, South Dakota. I don't remember seeing that information been -- to be given back to the Cheyenne River Sioux Tribe, the government. And if it did, we never received it as Council representatives.

MS. DEVINE: Yes. The meeting that we held in

Dupree was what we consider a scoping meeting. And what we do, is we talk to individuals and we don't necessarily record as we are here at the public hearing. We take that information and we talk about it, what individuals provided us. We don't do it by name so it's not a written record as this public hearing is. And we use it to focus our analysis on things that are important to the attendees at those meetings as well as comments that are received

2130 (cont'd)

through the mail.

Now, we did receive comments from your Nation, written comments, and they are published in the back of the appendices of the Final Environmental Impact Statement. I believe you have a CD copy. And those comments are taken and we use them to help us analyze what the impacts will be and come up with a potential effect.

MS. ARDYS COOK: Could you answer why they weren't given back to us as a government right after the hearing? I know you took -- you just stated that you used them for the analysis, but why wasn't the analysis report given to Cheyenne River?

MS. DEVINE: We provided a copy of the Draft Environmental Impact Statement to the Cheyenne River Nation and to the Tribal Historic Preservation

Office.

MS. ARDYS COOK: I just have a closing comment. In regards to this project, I have to trust and be in agreeance to my colleagues that have spoken and with all due respect of the residents and our people and our future of the Cheyenne River Sioux Tribe. Thank you, Mr. Chairman.

NA-7

CHAIRMAN KECKLER: Okay. I've got Sharon next.

2131

MS. SHARON LEE: Thank you, Mr. Chairman. (Speaking in Native Lakota) Good morning. (Speaking in Native Lakota) I shake your hand with a good heart.

2131 (cont'd)

I'd like to welcome everyone here today. I'm Sharon Lee. I'm a District 4 Councilwoman. And I agree with the comments that were made by my colleagues today.

I'd also like to state that we're not against the military at all. My oldest brother Ron is an honorably discharged disabled Vietnam veteran. And when -- I believe that a lot of people don't know that when our Senator Tom Daschle was in office, he had a study conducted regarding Native American male veterans, and the results of that study were that 90 percent of Native American males in the United States are veterans, and also that 92 percent of

Native American males in South Dakota are also veterans. And that's the largest ethnic group, the largest percentage in the United States. So I just wanted to make that comment because I know that there's a lot of people out there that aren't aware of those statistics.

I agree with the comments of my colleagues. And I also would like to state that I am opposed to this. I am opposed to this. I don't believe it's in the best interest of the Tribe. And I'm just -- I just wanted to state I am opposed to it for the record. And I know we're not the final decision-maker, but I wanted to put my comments on record that I'm opposed to it. And I know we don't make the final decision, but I guess we just wanted

GE-2

our voices to be heard. So thank you. (Speaking in Native Lakota)

2132

CHAIRMAN KECKLER: Bob.

MR. BOB WALTERS: Thank you, Mr. Chairman. Good morning and welcome to our Great Nation. My name is Bob Walters. I am a District 5 Council representative.

First of all, is this considered a government-to-government consultation today? Is that what this is?

MS. DEVINE: No, sir.

MR. BOB WALTERS: No? Okay. Because if this is a public hearing, you know, we have over 16,000 membership on this reservation and they need to be advertised so the people could be here. There's only 15 of us here, plus our executives, you know, to make comment here, plus a few of our Tribal members. Some of our respected elders are sitting out there and I hope they will be able to -- be able to make a comment. Our previous Chairman Borland is setting in here today. I hope he will make a comment, and especially our elders that are sitting here.

NA-9

I went to the first meeting over in Dupree, South Dakota. I was with the Cultural Preservation Administration. Also, my colleague Mrs. Cook was over there. We made comments over there.

I guess I have great concern about, you know,

2132 (cont'd)

where -- we're all about our land base here. That's what we're about, is our land base. Our reservation is 2.8 million acres. And what we have is agriculture. We have ranchers. We have cattle, horses, buffalo. Some of them have sheep, I guess. That was one of our big concerns when we went over to Dupree and commented about, was the animals.

LU-3

But we even have a bigger concern because we have our culture, and our culture is alive and well on our reservation. Many of our people practice our culture. And we have, you know, our hanbleca, you heard Mr. Vance talk about it, and when we're praying on the hill and to have a plane go by that's going to distract you. I know because we seen it in the past.

NA-4

I believe this diagram could be changed, taken from the northwest part of our reservation, it could be moved. We have our Sundances. We have other ceremonies that happen throughout the year, not only in springtime, not only in the summertime, and this is a grave concern of mine.

DO-7

NA-4

I really appreciate all the comments that my colleagues made and especially to hear about, you know, the aboriginal lands, how big our land base was at one time and how it dwindled down into where we're at today.

I always say we never asked to be boxed in. We were boxed in. The federal government said, "This

2132 (cont'd)

is where you're gonna be, Cheyenne River Lakota Nation. You're gonna be here. Standing Rock Nation, you're gonna be here." We never asked for these things.

I sit on many different committees on the outside and I hear a lot of things from federal agencies, from governments, from the states, and I really have to agree with what Mr. Dupris said. All these public comments being taken, are they even gonna be considered? Because I know when we do work with other federal agencies, they come here and do a government-to-government consultation, a lot of times it's dropped in the garbage can before they even leave the room. They forget about us.

NP-2

And it's hard. It's hard to understand why. Because we are a sovereign Nation. We are a government of our own. The federal government is a government of their own. The state government is a government of their own.

So for the record, I'm not speaking on behalf of our people. I'm speaking for myself because public hearings should be advertised. Our people should be here to make comment. We have a lot of people on our reservation and we have a lot of people off our reservation.

NA-9

I, too, am not against the military. Many of my family members were in the military. My father, my uncles, my cousins, my brothers, many of them

2132 (cont'd)

were in the military. And we have a lot of Lakota,

Dakota, Nakota peoples in the military today, you know, and we've lost some of them in action, you know, from Iraq, Afghanistan. Sad but true.

So for the record, you know, I'm gonna oppose with my colleagues here today and see what happens, see what comes out of this in the end. Because to me, it's gonna happen anyway. That's the way things work. Thank you. GE-2

CHAIRMAN KECKLER: Thank you, Bob. Dixie.

2133

MS. DIXIE LECOMPTE: Good morning. I fully support the military. My son did time in Iraq. He was over serving our country.

But my greatest concern is the water. I represent all this water here. This is what I represent. (Indicating) And it's good to see that you had in your comment here, going through it real fast on this disk that you -- it says the Big Horn, Tongue Powder River, Little Powder River, Missouri, Belle Fourche, Cheyenne River, Moral, Grand, and Cannon Ball Rivers, you talk about the rivers in all that, it comes into the Missouri and the Yellowstone. That's part of what you have here. And my greatest concern is the water. PR-1

And it says in here, this disk that you gave us, the trends typically show a slight increase in

2133 (cont'd)

pH over the past 20 years. So I would like to see the data that was put together for your little disk. And I oppose it and I know my people that live along the water oppose it. So that's my comment.

PR-1

GE-2

CHAIRMAN KECKLER: Thanks, Dixie. Robin, you had your hand up.

2126 (part II)

MS. ROBIN LEBEAU: Yes, I wanted to put something else on record because, like Ryman said about an insult, I feel that this hearing was thrown on us; that according to the memo that we received on December 2nd, they said -- it says to call the Preservation Office for the time on December 9, 2010, during the Tribal Council session for a government-to-government presentation by Ellsworth Air Force Base, you know.

So the whole time I was under the assumption according to this memo that they were coming here to do a presentation. And I feel -- I'm still like, from the very beginning when I heard it was gonna be a hearing with a court reporter, I was upset. I think our Tribal attorney should have been here. I also think it's very important for Mr. Borland as our Trust Officer for the Cheyenne River Sioux Tribe to let us know what the BIA is going to do in looking out for our trust rights, you know, our

NA-9

land.

So I just wanted to make that -- aware of that.

2126 (part II cont'd)

NA-9

Powder River - Eagle Butte.txt

I believe that they came here on -- and I don't like when people misrepresent and they're not misrepresenting the Powder Bluff, but they came here for a presentation is what we were told, not a hearing, not a public hearing. Thank you.

CHAIRMAN KECKLER: Thank you, Robin. Mr. Widow?

THE COURT REPORTER: Could you speak into your microphone, please? I can't hear you.

CHAIRMAN KECKLER: He don't want that mike.

THE COURT REPORTER: I can't take it then.

CHAIRMAN KECKLER: Okay.

(Off-the-record question from Mr. Edward Widow.)

2134

PN-2

COLONEL ELDRIDGE: Sir, I didn't catch your name. Mr. Widow? Mr. Widow. Mr. Widow's question was why was the land chosen where it was as opposed to picking like over top of the Black Hills or the Big Horn Mountains out in Montana.

And the reason that land was chosen was for many, many factors, but one of them is how the existing air routes that go into major population centers are, so that's why it looks very triangular

COURT REPORTING SERVICES (605) 718-1107

66

and very boxy, if you will. So part of the consideration was existing air routes and existing air traffic, as well as other areas -- that area is flat so it makes for a good training area.

The western part of the area that we're

Page 59

2134 (cont'd)

requesting the expansion does have some mountainous areas and that helps out with our training, too, but we need to make sure both flat areas as well as mountainous areas, and working towards the south towards the Black Hills wouldn't have worked.

MR. EDWARD WIDOW: Another question.

(Off-the-record question from Mr. Edward Widow.)

COLONEL ELDRIDGE: Mr. Widow's question was, as the aircraft fly, are they loaded or are they empty. And, sir, the aircraft would be empty. We would not carry ammunitions at all in this airspace.] AM-30

MR. EDWARD WIDOW: Thank you. I just want to tell the Council that, remember the other day I told you about Pearl Harbor? Do you remember that? You wasn't born then. These guys weren't born. All of you probably wasn't born. And what happened 70 some years ago? All the -- all the personnel people, military, they were laying out in the beaches sunning theirselves and yet -- I can understand that

the Air Force -- why they're practicing flying low. You know that. You know, back in them days, Japanese, they figured it out. That's what they did. They would fly low right under the radars and just about wiped out the United States, Navy ships, military people, Marines. Oh, they killed a lot of people. They sinked a lot of ships. Remember, we don't want to get caught like that.

2134 (cont'd)

Powder River - Eagle Butte.txt

Think about the generation that's coming behind us. You know, today it's China, North Korea; very dangerous people, nations. They got all the nuclear weapons there, nuclear submarines. We don't want to get caught. United States don't want to get caught like that.

So these Air Force people, Army, Navy, they take training every month, every day probably. (Inaudible) It could hit Seattle, the west coast coming for the United States. We never know. We don't know that.

And so, Council, just think about that. And, people, we don't want to get caught like that, all of them islands, beaches. That's all I want to say. Thank you. GE-9

CHAIRMAN KECKLER: Thank you, Ed. Is there any other comments? I got Council that hasn't spoken.

COURT REPORTING SERVICES (605) 718-1107

68

Buddy? Todd? Frank?

MR. TODD WARD: I have no comment.

CHAIRMAN KECKLER: Buddy? 2135

MR. TED KNIFE, JR.: I went to the meeting in Faith when they had it there and I opposed it there.

CHAIRMAN KECKLER: Okay.

MR. TED KNIFE, JR.: My name is Ted Knife, Jr. I'm probably from the smallest district on the reservation, but, you know, I got a lot of relatives up in Standing Rock.

As one Nation, we say one Nation, we're

Page 61

Powder River - Eagle Butte.txt

2135 (cont'd)

supposed to include Standing Rock. And I was gonna say, move this whole thing up to the north, but we got relatives up there, too, in Fort Peck, the Assiniboine Tribe. They were with us when we battled down at Little Big Horn. And up in this area where -- up in the corner there, grandpa had land up there. Mr. Lafferty just started a memorial up there for children.

So I oppose this. And I don't have no deal with the military, but I know they gotta do what they have to do. I had a lot of relatives that were in World War II. And I had two grandpas in World War II. One got wounded in Vietnam. I had one relative that never came back from there. The

GE-2

COURT REPORTING SERVICES (605) 718-1107

69

military has to do what they have to do, so it's kinda hard to say anything, you know. That's all I have to say.

CHAIRMAN KECKLER: Thanks, Buddy. Use the mike.

2136

MR. RAYMOND USES THE KNIFE, JR.: I just have a few short comments. Yeah, I grew up in that area that you guys are talking about. And I remember when I was a kid, I had a lot of these B-52s fly right over the ranch and right over everyday activities that we had, whether we were swimming in one of the dams or riding horses or whatever, and it never really bothered us as far as -- as far as impacting our daily lives. There's a lot of thunder

Page 62

2136 (cont'd)

and a lot of sonic booms, but I've never seen any fires created from some of these aircraft or never seen anything fall from the sky or -- but I did have a dream one night when I was a kid.

I dreamt that right above us, one of the nights after I woke up, that there was air-to-air combat right above us in that area. And it comes to remind me of what kind of day in life we're living today as American people here and abroad. We have to think about what our enemies are proposing right now. They want to get rid of us American people. And we

see that every day with 9 -- 9-11 happening and just in the news recently the attempted bombings right here in our own country.

So I think the more we are -- as the public are alert to the possible terrorism that's impeding upon us, it's eminent, you know. Maybe as it escalates, maybe we see some of it here right in our own territory. So the way I feel is that if any enemy aircraft, that it infiltrated our airspace here and anything the likes of an F-14 coming here trying to target some of our areas here, I would rather see some of our aircraft, you know, in this area. And if they're doing that for training exercises, you know, these aircraft really protect a lot of lives here and abroad.

The ground troops that are out there, they depend on us. They depend on a lot of this

GE-9

2136 (cont'd)

protection. So if they can train some of these young pilots to be ace pilots and to protect us here in our own homelands and abroad, I guess I'm for it because I've never seen any -- any problems where I lived growing up.

GE-9

GE-1

True, we have a lot of our own Native Americans in the military and they're out there. Their lives are in danger. Maybe some of them are pilots. I don't know. But those are my comments. Thank you.

2137

CHAIRMAN KECKLER: Thank you, Raymond. Frank.

MR. FRANK THOMPSON: Thank you, Mr. Chairman. I wasn't gonna comment, but I'll -- I'll say that I didn't know that this -- I was not -- I will not state my name for the record because I am part of this Tribal Council, and if this is a court proceeding hearing, then we should have been notified to that effect that -- that it was gonna be a court process hearing because this may come back to haunt us at some point.

NA-9

And I don't think we should be putting our names on record. We're here representing the Tribe as a whole and we should be referred to as Tribal Council or Tribal government. I just want to make that comment for the record. But I won't state my name.

CHAIRMAN KECKLER: Todd.

MR. TODD WARD: I'm the same way with him. We represent the whole Tribe. As a whole, I gotta

2137 (cont'd)

respect my Tribe, what they are going with. I do like what you guys are doing as an Armed Forces. But when I was a kid, about lost my brother over a fly-by; about got drug to death. That's all I gotta say.

2138

CHAIRMAN KECKLER: Thank you, Todd. Marcella?

MS. MARCELLA LEBEAU: (Speaking in Native Lakota) Excuse me. I have laryngitis. What I said was, I shake your hand with a good heart. And my Lakota name is Pretty Rainbow Woman and my other name is Marcella LeBeau.

First, I want to thank the officers for their service. I had one of the greatest honors and privileges of my life to serve in the military. I've lived on this reservation most of my life except for my schooling and for my military service. I served in England, France, and Belgium.

My great-grandfather Mahtotowpa, Chief Joseph Four Bear, signed the Fort Laramie Treaty of 1868. That treaty has been broken and we lost our lands. And it has been pointed out that -- of the land that we have lost.

Today we have 80 percent unemployment on our reservation and we have the IRS in here taxing our people. There's something wrong with that picture. If we had the land that belongs to us, we wouldn't be bothered by the IRS. And we need to protect what we do have left even if it's the airspace.

2138 (cont'd)

And I appreciate all of our Council representatives supporting this. I'm grateful for

that. And I just wanted to comment that I am opposed to this and that's my comment. Thank you, Mr. Chairman. GE-2

CHAIRMAN KECKLER: Thank you. Do we have any other public that wish to comment?

2139

MR. JOE LAFFERTY: Good morning. My name is Joe Lafferty, Mnikoju Tribal member.

I'm opposed to this. But also in relation to our relatives up in Hunkpapa Mnikoju, in any other Indian Nation, we get a lot of these types of impositions placed upon our leadership and placed upon our membership, and whether it goes or not and when it does happen, we're never given the important part of being reported to everything that is happening as it happens. Because if we were to allow the Air Force to fly within our airspace, how would they account for the number of flights? How would they account for the amount of time used in our airspace? GE-2 GE-7 NA-6

And this relates to everything. But because this is the particular subject now, we are never giving -- given personnel within our Tribe, within our Tribal membership that would be I guess a reporting point for the Air Force or whoever it may be to keep us apprised of all of the goings-on and

2139 (cont'd)

all of the happenings so that we can follow through on it.

Because when they brought -- when George Custer brought the miners into the Black Hills and violated our treaty, from that day to now there has never been a proper accounting of the amount of gold that was taken out of our Black Hills and every other issue since then. We have to report everything that we do to the point of blood degree of who we are and we're given a Tribal enrollment number which our leadership has to keep track of every year and every birth and everything that happens here on our land, we have to report that to the federal government, but when the federal government wants to come on our land and do -- have things going on like this fly-over and use of our airspace, how much of that is going to be reported on a daily basis not only to us but to all the citizens here in the Northern Plains area. We really don't have nobody that updates any of us, but they sure want to take advantage and use it.

NA-8

So that would be my comment. I'm opposed to it basically because the federal government never accounts to any of us citizens, either Indian or non-Indian, the amount of use, the daily flights,

GE-2

2139 (cont'd)

et cetera, et cetera. So I just wanted to make that comment and that I am opposed. Thank you.

CHAIRMAN KECKLER: Thank you. Bryce?

MR. IN THE WOODS: Mr. Chairman, I'd like to give the floor to the Bureau Superintendent Mr. Borland to make some comments and then I'd like to make another comment.

CHAIRMAN KECKLER: Okay. Mr. Borland? 2140

MR. BORLAND: Good morning, Mr. Chairman, Madam Secretary, Madam Treasurer, members of the Tribal Council, and the general public.

First off, I'd like to congratulate the new Administration and new Tribal Council. I haven't officially went on record doing that, and I'm definitely looking forward to working with you.

I was just made aware this morning by Mr. Steve Vance that -- that the Air Force was going to be meeting, my understanding was a meeting with the Tribal Council. I was given this document which I think that everyone has a copy of. (Indicating) So for the record, if this is a public hearing, I was not informed as such.

NA-9

I'd also like to apologize to the elders, I see that there are many here that have not had a chance to speak, and for my speaking before they've had

that chance.

I'd like to relate a couple of quick stories. The first is, I, too, not only respect the military,

2140 (cont'd)

but my family has a deep tradition when it comes to the Air Force. In World War II we didn't have an Air Force. We had what was known as the Army Corps, the Army Air Corps. My Uncle Art Bridwell was the first Native American Air Force pilot. He served in the Pacific Theater all the way from the beginning of World War II right after Pearl Harbor. He graduated from -- as a matter of fact, he was a pilot before he went into the military, graduated from South Dakota State University, volunteered and went virtually straight into war, served all of the years of World War II, served as a Major in the U.S. Army Air Corps. He sent fighter -- he was a mission leader. He sent fighter pilots out on mission, went with them. He had actually more medals and awards than probably these gentlemen here today. I was noticing the numbers of ribbons that some of these guys had.

The thing of it was, our family only knew that Uncle Art was in the Army Air Corps. We had no clue until he died. And I always remember giving his obituary. The family chose me. I was inaugurated

as the Tribal Chairman on October 2, 1990. My uncle died the day before that. We buried him a few days later and I gave the obituary.

They asked me to open up his war trunk. He had this big green war trunk that he had kept under lock and key. And we opened it up. It was amazing the

2140 (cont'd)

amount of medals and awards and commendations that he had; articles and stories about his ex-wife. He kept them a big secret, never bragged about it.

He flew actually 21 different types of planes. After the war and up and to the point where we now have the U.S. Air Force, he actually was a trainer. That's what he did. He trained pilots on how to fly virtually every type of aircraft that they had.

Now, the reason I relate that is there's a little story about Uncle Art getting court marshaled. Interesting story when we're talking about flying on the reservation.

My Uncle Art was married to a lady from Florida and they had two beautiful children, and then he joined the military and he was over in the Pacific Theater fighting for the protection and safety of this country. His wife was killed in a car accident and they wouldn't let him come back. You just can't fly from God knows where he was at and come home for

the funeral. As a result, his two children wound up being kept by my Grandpa Bridwell. Grandpa Bridwell as many of you may know him, Oscar Bridwell, he was married to Mary Fatting Sitting Crow, and they -- or excuse me -- Sitting Eagle and they kept these little babies down at La Plant.

So eventually after a year or two they let him come home, and his mission was to fly from Seattle a load of soldiers down to we were told somewheres

2140 (cont'd)

down in Texas and then from there back to wherever he was supposed to go and then back to the Pacific Theater. Well, he did so, except he took one big, giant detour and landed that big old plane full of soldiers on a little dirt road by La Plant. Well, first he stopped in Dupree, okay, looking for his kids and then he stopped in La Plant.

Well, anyway, he got court marshaled. He was a Major. The court marshal knocked him down to a Captain. He went back on the line and got his rank back.

But I heard Mr. Widow talk about Pearl Harbor. It made me think about my uncle. You know, I can remember many, many stories that my uncle told me, but he never told me about any of that. My grandma told me those stories later.

And, you know, I think about we've had this relationship with the United States government, especially the military, going back to the first treaty that the United States ever, ever, ever passed. The new Continental Congress passed a treaty with the Delaware Nation. That was a treaty of war. They needed the Delaware Nation to help fight against the King of England. They needed the military support of the Delaware Nation. And had it not been for the Delaware Nation and many other Native nations, and this is a little history lesson for the gentlemen here and ladies from our military,

2140 (cont'd)

we might all be paying taxes to the King of England yet today.

It's a known fact and well related by not only Senator Daschle but Senator Dan Inouye who himself is a highly decorated soldier of World War II, the Native Americans are the first to volunteer in time of war and in greater numbers, I heard it said here, than any other ethnic group, any other American group.

And I told Senator Inouye, we do that simply because this is our country first and foremost. This is our land. We were here long before anybody else. We have a double reason to fight for this

country like my Uncle Art did, like my Uncle Ray Marshal.

Uncle Ray also joined the Army Air Corps in World War II. He went all the way through Korea, served in Korea, and ended up his career in the United States Air Force with two tours of duty in Vietnam.

You know, we have this long history of fighting for this country. I really would like to encourage our comrades here in the military that the next time that they come on to an Indian Nation, that they take the time to read the treaties. Go back to the Delaware Nation Treaty. There's 725 treaties that you can read.

At the very least, the Sioux Nation deserves to

NA-7

2140 (cont'd)

have the respect given that when you come on to -- and this is one federal agent to another -- on to the reservation, to understand the audience that you're talking to and the laws that we were told are the supreme law of the land, which is the treaty.

When Lewis and Clark came out here in 1805, they respected the Lakota Oyate so much that before they would cross that river, they cut a treaty, go back and look at it, the Treaty of 1805, to cross over into what they recognized as the lands of the

NA-7

Lakota, the Dakota, Nakota. They were military sent on a mission from the President. Almost all treaties after that with the Lakota were signed by generals and military.

So again, I would encourage the United States Air Force out of respect to our people to do the same. Study those treaties; understand the importance and significance to our people.

Finally, from the perspective of the lands that I'm entrusted to watch over as a trustee, my concern would be firefighting naturally. That's a concern that -- you know, fire knows no boundary. I don't care if it's just Meade County or Corson County or Hawkin County or any of the counties, firefighters -- excuse me -- fires out here have been known to reach ten, 20,000 acres in nothing -- nothing flat.

SA-5

Also, I would advise the Council, you own

NA-7

2140 (cont'd)

480 acres of land in the Black Hills on the Wyoming side. That needs to be addressed, needs to be looked at. That is something that -- that we -- we still have a job to do, to take that into trust. And that's a job that I hope and pray that this Chairman and this Council will take on as a task.

So I have a concern as well and I would hope

NA-7

that, you know, if this does proceed ahead, that the Air Force would sit down with both the Tribe and the Bureau of Indian Affairs and begin the negotiation of a memorandum of either agreement or understanding on what is gonna happen, especially when it comes to firefighting, any kind of things, debris left behind.

SA-5

On a lighter note, one last story and then I'll leave. When I was just a little boy about eight years old, true story now, don't hold me to this but it's the truth, my Grandma Carrie and my Aunt Mary Long Break, they went turnip digging down in Armstrong County. Many of you remember where Gene Long Break then used to have a place down there. Well, anyway, they went turnip digging and us kids always had to help.

Well, what's interesting is, we dug up more than just turnips. We dug up a bunch of bullets, too, some great big ones. I always remember that bullet looked to be that big to me. (Indicating) It was a huge bullet. And we had several of them.

2140 (cont'd)

So we threw them in the trunk and got back down to Ash Creek. And my grandpa seen them bullets and he took them away and he put them -- I seen where he put them. He hid them up on a shelf, okay.

Well, one of my cousins come down that summer, and I crawled up there and dug that -- one of them big old bullets out. And he had a vice on his bench, his workbench, so we took that bullet and we put it in the vice and jacked it down as tight as we could get it, kinda aimed it out the door, I can still visually see that tractor sitting there today, and we took a big old hammer, you know, kids, we're just little kids, and we were bound and determined to shoot that bullet off and with a little luck maybe hit that tractor, okay?

So we hammered and hammered and beat on that bullet, bent it up every which way, and it wouldn't go off. Great big old bullet, okay? Well, I guarantee if that bullet had went off, I probably wouldn't be here today. If the bullet didn't kill me, I guarantee you my grandpa would have if I'd have hit his tractor.

So this is some of the stuff that our people still experience today. You know, we're still cleaning up from World War II, that site down there. And I would hope that if this were to happen, that in the future, you know, that -- and I know how these things go. Kinda get your foot in the door

2140 (cont'd)

kinda thing. The Badlands, the Oglala has lost a

huge amount of land for gunnery ranges. You know, I would just hope and pray that, you know, something be taken into account that if one of the bombers went down and there was debris scattered, you know, that these things would be mitigated unlike the days of old.

SA-20

So with that being said, I thank you for the time. I didn't realize that this was like a hearing or a public hearing. And for the most part, most of the comments that I made were my own personal comments and I'd like to leave them as such.

Again, thank you, Mr. Chairman, for this time. Thank you.

CHAIRMAN KECKLER: Bryce?

2124 (part II)

MR. IN THE WOODS: We'll give the Superintendent a new name. Windy Boy.

Again, greetings to the Air Force. And I remember the Yakima Fire Center out in Washington, we were out bullwhacking below a butte. It was called Squaw Tooth Butte. I took offense to it and some of the sergeants there were saying that. "That's Squaw Tooth Butte up there." They told us not to go up there.

But that night when everybody went to sleep, I went up there. And it looked like a butte, but when

2124 (part II cont'd)

you got on top, there was like a ten-foot drop, you know, where it was probably a burial site and they removed all the, you know, all the human remains on that burial site.

That was my first being sitting there on that butte that they called Squaw Tooth Butte. And I was very offended to that.

And, you know, there's rivers coming through, as Council LeCompte mentioned. Mni Wiconi we call it, water of life.

I was sitting hanbleca over here by Owl River. We call this Owl River, but on the map they call it Moreau River. And they call this Wakpa Waste, Good River. They call it Cheyenne River.

I was sitting up by Owl River in the vision pit, and I could come up and there was a lot of planes going by, a lot of commercial planes, and there was a plane that went by that didn't make no sound and it had a different shape and it wasn't a B-2. I don't know what -- I thought it was a UFO because it didn't make no sound. And a little while later there was looked like an AWAC that was right behind it. And when that went out of sight, then there was another military plane that was following that AWAC. It was a different type of plane,

military, Air Force plane.

So I was kinda wondering, what -- what that --

2124 (part II cont'd)

that plane that didn't make any sound that went by while I was on the hanbleca. Hanbleca is -- you can call it a vision quest. And I was down here on a hanbleca by the Good River. Again, I could see all these contrails. And the thing about contrails and what they're doing to the health of the American people here, you know, they won't say it, but there's a lot of respiratory all over this country.

I don't know if the Air Force polices the sky, but there was a plane, an old silver plane that flew low by the Good River and he started letting stuff out. And to me, I wanted to know what is that dumping out of his plane.

So the Air Force, you know, I believe you probably do monitor probably I'd say illegal activity that's affecting us here and close to our waters. I witnessed that. Because you sit out there, you know, for a couple days and nights so you can see what's going by. And it's disturbing. It's disturbing what's happening in our skies. And you think you're in a rural area, but there's a lot of things that are happening that are illegal. They gotta get rid of waste, hazardous waste materials,

NA-13

and they're always looking, you know, to get rid of that waste, whether it be nuclear or chemical or others.

And I know about ordnance, too, because, you know, we protected our ammo depot and one section

2124 (part II cont'd)

was, you know, nuclear weapons. That was kind of a wake-up call to me because there was one area that was covered, No Man's Land, you know, go in there, whole herds of buff -- deer would get wiped out because of the mines and stuff that are there, spotlights. We were protecting that ordnance, and there was nuclear and biological and chemical weapons that the Army had.

So, you know, that's just to give you a familiarity if you hear about our way of life and the way that we go out and -- and we call it hanbleca. It's crying for vision.

And on your Alternative A, the proposed action, and Alternative B and Alternative C and then the No-Action Alternative, a colleague asked are you guys gonna have a public hearing. Because right now to me, this is kind of like consultation now, government-to-government. And if the public here in this community -- because this is our hub, we view it as our hub, if there's gonna be a hearing, public

NA-9

hearing to hear the people.

But the No-Action Alternative, what is the majority of the response that you've had on Alternative A, B, C, and the No-Action Alternative? Can anybody answer that question? Do you have that data yet or...

Is there a majority? Is there -- on the responses on Alternative A and Alternative B and

NP-2

2124 (part II cont'd)

NP-2

Powder River - Eagle Butte.txt

Alternative C and then the No-Action Alternative, what is the feedback you're getting from these hearings that you're holding, the comments that you're taking? Because it sounded like when you were in Dupree, you weren't doing it as extensively as you are doing it now verbatim, but you were just taking comments and then you were sifting through those comments and then lining them up with what alternative would have the majority. And to me, that don't sound -- don't sound too good. Because, you know, you hear the majority here that are opposing it because of historical factors. Can you answer that question?

MS. DEVINE: We have had many commenters offer their preferred alternative. So in other words, just because the Air Force prefers Alternative A, each of the alternatives is analyzed independently

COURT REPORTING SERVICES (605) 718-1107

89

so that they can be weighed against each other. And throughout the National Environmental Policy Act, we're required to respond to comments that we receive at these public hearings.

Our previous scheduled meetings under the National Environment Policy Act was to get a feel for what the public opinion was and also have them offer other alternatives to the action. Does that answer your question?

MR. IN THE WOODS: No. It sounded like a --

MS. DEVINE: A loop?

Page 80

2124 (part II cont'd)

MR. IN THE WOODS: It sounded like a -- no, it didn't really answer my question. I was just asking that -- I know the Air Force is pushing Alternative A, and I was just seeking if there was, from the public comment, if the public was -- is not opposing the Air Force like we're not but we're opposing, you know, this altogether.

But the No-Action Alternative, is there more public comments saying that just leave it as is? Because I know that there are ranchers and farmers here, you know, there's a story right there and my colleague over here Ms. Ardys, we both represent the area that this is gonna impact, Ziebach County, and that's one of the poorest counties here in this

country. And you hear colleague Merrie say that we're interested in economic development and if there was a bridge. We heard the Superintendent mention the MOA or MOU, a bridge between the Air Force and our Tribal government because of our gunnery range over here, the ordnance where they discriminately use live exercise on the reservations. Some of the officers aren't aware of that. You know, they did it in Pine Ridge and they did it here, too, where they were using live, you know, live exercise like the Yakima Firing Center.

And if there was some type of a -- like a relationship that could be a government-to-government relationship where -- you

NA-11

2124 (part II cont'd)

Powder River - Eagle Butte.txt

know, as part of an MOA, I think that would be a route that I think some of our colleagues would like to look at instead of being pushed to say yes or no, you know.

MS. DEVINE: Yeah, we actually have been in contact with the Historic Preservation Council in Washington, and they have recommended that they participate with us in the Section 106 Consultation.

So NEPA is only a piece of the requirement for the Tribes that are impacted, and we also have involved in that the National Parks Service, the

NA-11

COURT REPORTING SERVICES (605) 718-1107

91

Forest Service, the U.S. Postal Service because they all have cultural interest beneath the area.

MR. IN THE WOODS: I understand that real well. And that's why we're talking today, is because of those laws, and I'm very familiar. Otherwise there would be no discussion here. You guys would be continuing, you know.

And the discussion I'm trying to drive at is a relationship with the Air Forces, Minot and Ellsworth, to assist us maybe in some projects in the form of -- I don't know. We look at national disasters here and the Air Force helped us out, you know. I know the Air Force has a lot of generators and, you know, to power those batteries and stuff. But any kind of help that would help us out in that form, where we had that relationship where I believe there is some surplus, could that be part of a

CU-4

Page 82

2124 (part II cont'd)

CU-4

Powder River - Eagle Butte.txt

discussion later on down the road. I know it's off of the fly zone, but I'm just trying to say we should bridge some kind of a gap here.

MS. DEVINE: I believe by establishing the relationship with the Ellsworth Air Force Base Tribal Liaison who has been appointed as Mr. George Stone over here, he has been working with Mr. Vance, and I think those are discussions that certainly

COURT REPORTING SERVICES (605) 718-1107

92

should be brought up during that process.

MR. IN THE WOODS: Yes. Because maybe your Tribal Liaison, which a lot of federal agencies are getting now because of President Obama, the Commander in Chief's directive to have all agencies consult with Tribes and develop policy to consult with Tribes, I'm glad that's happening. And maybe we could talk about those, maybe some other issues in the form of assisting each other on the ground. That would be my comments, Mr. Chairman.

2141

CHAIRMAN KECKLER: Thank you. Is there any other comments from the public? If not, I would like to make a couple comments.

And, Council, I received this letter. It was from Donna Ray dated December 2, 2010, and it was a memo to -- actually it was to Robin and from Donna Ray concerning the appointment request.

Apparently what had been happening, is Mr. Vance and that office had been attempting to -- repeatedly trying to get the Air Force to come and

Page 83

2141 (cont'd)

meet with the Tribal Council since -- sounds like since May of 2010, but due to some issues that have been happening, that didn't happen.

And so this memo actually told that they were coming. And then I went and I dug it up and I found

it actually yesterday afternoon/evening. And it was, according to the memo, it was to be a government-to-government consultation and then there was gonna be a hearing at the Cultural Center.

And, however, when Steve got -- talked to Steve a little bit and -- Steve Vance, and determined that I think it is important for us as part of the public hearing to state our comments. I don't think -- there's nothing wrong with that. Because probably what happened, it would have been at the Cultural Center and nobody would have knew about it and, as a result, there would have been no comments. And so that's why I allowed this to occur.

NA-9

My questions was, was a notice sent out -- this can be for anybody -- was a notice sent out advertising this hearing that was scheduled for today? Because I haven't seen anything in any local papers or notices other than that. And then the response to that was, if the notice was sent out, did it meet the requirements specified by law for the hearing? Can somebody answer that?

MS. DEVINE: Mr. Arlin Whirlwindhorse was scheduling these meetings for us as a Tribal

NP-8

2141 (cont'd)

Liaison --

CHAIRMAN KECKLER: Okay.

MS. DEVINE: -- for us. And I hope he offered Mr. Vance for our assistance. We do not, we the Air Force, do not feel that we have the right to make the general public aware of meetings on the reservation. So I tried to work with the Tribal governments to determine their desires for public notification. So the answer to the question, sir, is no, to my knowledge.

CHAIRMAN KECKLER: Okay. Thank you. Steve?

MR. STEVE VANCE: (Speaking in Native Lakota) In June I received -- I made contact with George Stone. And this is where since that time we've been trying to schedule a meeting. And when they say government-to-government, that is you. You're that government, governing body. We made comments and stuff. They wanted to put up -- or schedule a public hearing, at which time I was turned over to another contact person and they just mentioned his name, Arlin Whirlwindhorse, and we were trying to get some material together for the public to view in which these came out. There's some out here on the desk -- or on the tables out here, some of the information if anybody wants to pick them up.

This was in August. (Indicating) This is the Environmental Impact Statement. This is in that CD

that's in this little packet here. There's a -- in the front cover here, there's a CD here. That has all this information here. And I think that's what some of you were questioning, is where is the EIS on this. Well, it's in that little packet there.

But these here we got, oh, maybe a couple weeks ago. They sent them in a box because the other information that they had they said probably wasn't relevant to get their message across. So Arlin sent a box of these down.

We contacted KLND and we had them broadcast a scheduled meeting, public hearing meeting that would be at the Cultural Center. We had -- in November we tried to set something up. Elections were out. We felt this would be a good time because we have new seating at Council. Because some of you, like I said, have been involved in this for a couple years already. So we figured this would be a good time to get the new seated administration up to what has been happening to the point of this Powder River Training Complex.

So that was however many times KLND announced it. I heard it several times on there. When the -- when the delegation got here, we were gonna meet up to the Cultural Center and have public hearings up

there until Council could allow a slot for Ellsworth to come in and present. So we set up up there, and then I got in contact with George Stone this morning and he said they were on the other side of the building here, on the BIA side. So I called Joe, we shifted everything back to down here, and that's where they had said 10 o'clock.

So again, like going back to government-to-government, you are the government, governing body here of the people. And I mentioned that -- you know, some people can't make public hearings. You know, the only contact they have is whoever relays the information or what they hear on the radio or what they read in the paper. This is an opportunity for people in outlying districts from Bridger to Blackfoot, you know, Glad Valley to Swiftbird to hear their representatives speak on behalf of them.

So I know a lot of people can't make it to, you know, a lot of these hearings, and this is -- I apologize for how short it was, but like I said, it was -- the information that was delivered to us for public input was this packet and we just got this, like I said, a week and a half, two weeks ago. So, you know, it is -- it was a pretty, you know, tight

scheduling here because we figure with new administration here, they're gonna take this back, the CIS, because it is a draft, so they're gonna

take this back, and they will come out with a revised draft.

The original cutoff date was November 13th. That went by. That's why they opened it back up again for Cheyenne River to make their comments up to January 3rd in writing. And here, you know, basically a lot of it has been, you know, spoken out. But after that, we have I believe -- what, 30 days? -- 30 days to comment on the revised draft.

So, you know, it's not cut in stone yet, but yet again, you know, they do need to hear, you know, from the public as to what their concerns of this was.

So I just wanted to explain that. So if you want to see the complete draft, it's in that little booklet there with that CD in it. 2141 (cont'd)

CHAIRMAN KECKLER: Okay. Thanks, Steve. What I'm guessing is probably gonna happen is that, Council, we'll address this with our legal and we will do a formal resolution or action concerning this and that will be -- you guys will receive that via resolution coming in to -- on our action

concerning this.

But at this point, I think this kinda ends the -- this part of the... But, Council, I sure appreciate you guys for coming. If there's any closing comments, you're sure welcome to come up.

HEARING OFFICER GREGORY: I'll just make a

brief closing remark to wrap up the formal part of this.

First, I would just say as a legal adviser, the law prohibits me from acting -- as a Hearing Officer, the law prohibits me from acting as a legal adviser to the Air Force representatives or from getting involved in the proposal, but I will say that each of your comments, questions, concerns become a part of the record and will be considered by the decision-makers.

I also apologize for any confusion regarding the nature of today's hearing, and I'm sure the Air Force representatives at the appropriate level will be looking into that.

Just to reiterate, this is not the end of the opportunity to make comments on this. You can submit written comments at any time during the process, but the deadline I have now is January the 3rd, 2011, but I heard mentioned earlier that may be

extended. I'm sure you will be formally notified if that is.

A few of you mentioned you'd like to see a copy of the Final EIS. If you'd like a copy, please let one of our representatives know and they'll be happy to provide a copy for you by mail.

And with that, I'll conclude this part of the hearing and turn it back over to you, sir.

CHAIRMAN KECKLER: Thank you very much. Thanks

for coming.

At this point we will recess for lunch, and we will come back at 1:30 and begin with the other business. Thank you.

(The Powder River Training Complex Hearing adjourned at 12:30 p.m.)

To: Ms. Linda De Vine

From: Bowman North Dakota County Commissioners

Subject: Powder River Training Areas

We the undersigned Bowman County Commissioners and Auditor are very concerned about the proposed final impact draft presented at the public hearing, in Bowman, North Dakota, September 22. Bowman would be directly under Powder River Area 3.

With the Energy sector expanding in our area, we are in the process of building a new airport to accommodate these corporations and associated businesses. SO-10

Energy growth, small businesses, and agricultural commodity production are essential for the survival of our community. The expanded training areas would greatly impact this potential! SO-6

We hope the final recommendations include raising the Area 3 floor to 10,000' MSL, which would greatly REDUCE the impact to our flight operations. DO-4

Alternative C would be our next choice associated with the Powder River proposal.

In conclusion, we hope these recommendations and concerns are considered in the final Powder River Impact study. Thank you for your attention.

County Commissioners:

Bill Bowman
Rick Braaten
Kenneth Steiner
Pete Alkire
Lynn Brockel

Fax: (757) 764-1975

Dakota Rural Action is submitting these comments on behalf of our over 900 members. We have serious concerns about the proposed expansion of the Powder River Training Complex. Including:

- The reduction of the ceiling to 500 feet; PN-4
- The increased use of chaff and flares and the problems they may cause for cattle and wildfires; SA-5/BI-5
- The impacts of low flying on agricultural applicators, wind energy development and the health of livestock; SO-12
- The impacts of high speed, low flying aircraft on agricultural chemical drift; SO-2
- The process the Air Force will use to determine and deal with damage claims. It's preferred if local government is the mechanism used to deal with these issues. SO-12

Reducing the ceiling will have severe impacts on agriculture, the dominant industry in the region. Low flying planes will spook cattle, put producers working around the livestock at risk and cause concern for those applying agricultural chemicals. The Air Force has given these concerns little attentions claiming they won't fly when there are agricultural activities happening. However, agriculture happens every day of every year and more attention is needed in addressing these concerns. SO-2 SO-13

The increased uses of chaff and flares causes many concerns mostly surrounding the release of foreign materials onto private land and the impacts of these materials on the land and property. Fire from the flares is one of the most important concerns. SA-5

The process the Air Force will use to mitigate and deal with damage claims is also a concern. This process should really upon the local government agencies to determine the proper solution rather than an Air Force Committee. SO-12

Thank you for this opportunity to comment.

Sincerely,

Frank James

Langley AFB, VA 23665-2769

Subject: Draft Environmental Impact Statement for Powder River Training Complex

Dear Ms. Devine:

The Recreational Aviation Foundation (RAF) is a national organization with over 2000 supporters representing all fifty states. One of our missions is to promote aviation safety for recreational pilots.

The RAF is in support of proper training of our armed forces. However, what is proposed in regard to the expansion of the Powder River MOA is unacceptable. Public safety is compromised, especially with the lack of adequate radar coverage and communication. The RAF recommends that serious consideration be given to using the MOAs nearer the air bases from which the planes will be flying, not increasing the risk to Montana pilots and their passengers with low level bomber flights. The "see and avoid" concept does not work with the rapid closure rates that will occur. The shear size of the proposed MOA expansion could encourage pilots to fly through enroute to their final destination. AM-3 PN-2 SA-7

Another mission of the RAF is to expand recreational opportunities for pilots. This entails the building of airstrips where there are recreational attributes. The RAF is concerned that if and when the organization wishes to build an airstrip under the MOA, there will be opposition from the MOA administrators. SO-10

Being familiar with the proposed expansion area, I know there are numerous ranchers who use their small aircraft to inspect their cattle and check stock water facilities. They are not in a position to account for low level, high speed training aircraft over their land. Once again, this proposal puts others at risk. SA-9

On behalf of the RAF, I urge you to delay the Powder River MOA expansion until all the concerns of Montana's aviation community have been resolved to the satisfaction of all concerned parties.

Sincerely,

John McKenna Jr.

P.O. Box 429 • Hettinger, North Dakota 58639 • 701-567-2069 or 1-800-258-2069

RE: Proposed Buffalo Powder River MOA

Air Dakota Flite, Inc. in Hettinger, ND (HEI) has been in business for over 40 years. We are a FBO, with crop spraying as the mainstay of our business. For several different reasons, we would consider a MOA in our area to be a hardship to our business.

Our first area of concern is with crop spraying. Currently, our trade area for spraying is a radius of 80-100 miles from Hettinger, more north, east, then west, least to the south. We maintain 500' AGL when flying to and from fields, then lower for actual spraying. When our sprayers are loaded, they are near gross weight. Right now our concerns are wind and visibility. With a proposed MOA, our concerns are significantly increased. In the 1980's, there was a bomber route through our area using B52s and some fighter jets. B52s were relatively easy to spot, but even then, there were times, that our spray pilots had to change course in order to feel safe. It is also our concern that B1s and B2s will be more difficult to see by our pilots. Unseen aircraft, a loaded spray plane and the wake turbulence could add up to a major problem.

SO-2

SA-7

With our general aviation we have a couple concerns. The first involves our local pilots. Many of them are "Sunday fliers" or pilots who are generally out enjoying the country only during nice weather conditions. So, a MOA would seriously curtail their activity. A local businessman flies routinely, and it would be difficult to schedule his flying with a MOA. In Hettinger, we have a fairly active medical center. We have an average of 1-2 flights per week, bringing doctors to our clinic. These flights mainly use instrument approach and come even in adverse weather conditions. Most of this charter traffic comes from Bismarck, ND, but we do have one doctor that routinely flies in from Rapid City, SD. During the past 6 months, we have also seen an increase in air ambulance flights with an average of 2 per month. We feel that a MOA could affect our general aviation and the interest that is now enjoyed.

SO-5

Likewise, any transient flights to our airport will be seriously curtailed with a MOA. Pilots flying through our area are more likely to check the maps and decide to stay clear of our area. Our business will be reduced from lack of pilots using our facilities, fuel sales, etx. Our community also will lose business.

SO-6

Another area of concern involves our current and future pilots. In the past 30+ years, we've had an area north of Hettinger that we use for our flight instruction, a practice area for our students. If this area is listed as a MOA, we feel that it will deter the general public from checking into flight instruction. It would be difficult to concentrate on learning or instructing if you are worried about military traffic in the area.

SO-26

Serving The West River Area

3004

As a part of our business, we fly an aerial survey for wildlife. This is done for ND Game & Fish Department and we fly Adams, Bowman and Hettinger counties for antelope and deer count. This is a low level flight and as a pilot, you are watching the ground for animals, not the skies for military aircraft. SA-8

ADFI pilots also have a low level flight for highline patrol. Again, the pilots concern is looking at high lines, not for other low level traffic. A MOA would make our low level flights more dangerous to our pilots. Therefore, this is a great concern for us.

Another low level flight for us is our oil pipeline patrol. Our pilots fly this patrol at 500' AGL and below and are constantly looking downward for any oil leaks and or obstacles. They follow a marked area (trench line) that twists, turns, up and over hills, rivers, around train tracks that spans about 1200 miles of pipeline in southwest ND. We are dependent on weather for this flying and therefore do not follow any set dates. We fly Monday through Sunday, sun up to sun down. Many times, in past years, as with spraying, our pilots flying this pipeline have had to take actions to avoid military jets. Again, a big concern for us! SA-7

Last, but not least, I am concerned about the possibilities of a wind farm near Hettinger. There has been land leased for the past 4 years north of Hettinger and north of Gascoyne for the expressed purpose of a wind farm. So, the possibility of having renewable energy developed in our area is a distinct probability. The major hold up right now is that more investors are needed before the wind farms can proceed. I feel that having a MOA in our area would basically halt any renewable energy development in this area. SO-17

I recently attended an informational meeting at Bowman, ND. I met with Linda DeVine and feel that it was a good discussion. She told to resubmit our concerns at this time. I would like to see the ceiling for the proposed MOA be higher than 500 ft. It would be nice if there were established routes, so we would know where to be watching. There are a lot of questions that we still feel need to be addressed. We truly fee that this would be a hardship for our business and to our local flight traffic. At this time, with the information we have, we are opposed to a MOA in our service area. GE-2

Sincerely,

Charles Q. Lindquist

P.S. Are there any plans to have an informational meeting in the Hettinger, ND area? Also, I would appreciate some sort of response so that I know my letter has been received. My phone number is [redacted]

Langley AFB, VA 23655-2769

RE: POWDER RIVER MILITARY OPERATIONS AREA

Dear Ms. Devine,

Please accept this correspondence as Allegiant's official comment on the proposed expansion of the Powder River Military Operations Area (PRMOA).

Allegiant Air currently offers non-stop, commercial air service to Bismarck, North Dakota from two destinations located in the Southwest region of the United States. It is our contention, based on a review of the Environmental Impact Statement provided by the United States Air Force, that the proposed expansion of the PRMOA will have a significant impact on our current flight operations.

Specifically, we have identified two general areas of concern with respect to the expansion. First, the expansion of the Powder River Military Operations Area raises serious safety concerns. Second, the expansion raises concerns about the efficiency of Allegiant flight operations to Bismarck.

8360 S. Durango Drive · Las Vegas, Nevada 89113 · 702.851.7300 · 702.851.7301 allegiant.com

3005

At Allegiant, the safety and well-being of both our passengers and crew is paramount. Thus, developments that present a safety risk are taken very seriously. Accordingly, we are concerned about the safety risks inherent in the proposed expansion. No doubt the increased presence of high-speed military aircraft in close proximity to flight paths of civilian aircraft increases the risk of such a mid-air collision. Admittedly, while the risk itself may be small, any increase in such a risk presents a significant concern. Further, the aforementioned risk is magnified by the fact that pilots may be precluded in certain situations from flying under instrument flight rules, thereby further increasing the risk. SA-1

Additionally, civilian aircraft risk encountering increased air turbulence caused by wake vortices from large military aircraft. While the risk of injuries resulting from such turbulence may be low, turbulence is uncomfortable and generally frightening for both passengers and crew members. SA-7

With respect to operational concerns, we believe that the expansion of the PRMOA will have a negative impact on the efficiency of each flight to and from Bismarck. Specifically, the increased size of the PRMOA airspace would require pilots to dramatically alter their flight path, resulting in both time and cost inefficiencies. For example, a pilot landing at BIS would be forced to fly around the area completely, or fly above the area and then descent rapidly once the aircraft was clear of the PRMOA. SO-8

Similarly, a pilot departing BIS to an Allegiant destination would be forced to maneuver around the PRMOA, or rapidly ascent after take-off in an effort to get above PRMOA airspace. Consequently, Allegiant would incur substantial increases in fuel charges driven by a substantial decrease in flight efficiency. SO-7

Further complications will arise when the PRMOA is active. During military operations, Allegiant pilots may be required to operate under visual flight rules (VFR). In inclement weather, or at times when visibility is low, Allegiant would have no choice but to take delays as flying in such conditions under VFR is prohibited. Delays to Allegiant aircraft result in significant costs to the company in terms of both revenue and reputation. SO-8

8360 S. Durango Drive · Las Vegas, Nevada 89113 · 702.851.7300 · 702.851.7301 allegiant.com

3005

Should the expansion of the PRMOA occur as designed, Allegiant would be forced to reevaluate its current flight schedule to BIS, and may ultimately determine that continued service of the market is no longer feasible in light of increased costs and decreased efficiency. Naturally, this would be a significant detriment to both the Bismarck airport and community. SO-10

Allegiant understands the need for adequate military training areas and respects the arduous and dangerous work the men and women serving in our Armed Forces perform on a daily basis. Further, Allegiant is a proud member of the Civil Reserve Air Fleet and enjoys the privilege of providing charter aircraft for the Department of Defense. Nevertheless, Allegiant believes the unprecedented expansion of the PRMOA will have a negative impact on Allegiant Air and the Airline industry serving BIS as a whole. Accordingly, Allegiant respectfully requests that the Air Force reconsider its proposed expansion and adopt the "No Action" alternative until a more suitable alternative is identified. GE-2

Once you have had an opportunity to review the foregoing, please contact me with any questions, comments, or concerns. In that regard, I look forward to working with you.

Sincerely,

E. Keith Hansen, Esq.

NORTH DAKOTA
Atmospheric Resource Board
A DIVISION OF THE NORTH DAKOTA STATE WATER COMMISSION

November 10, 2010

Ms. Linda DeVine
HQ ACC/A7PP
129 Andrews Street, Room 317
Langley AFB, VA 23665-2769

Subject: Comments on the Draft Environmental Impact Statement for the Powder River Training Complex

Dear Ms. DeVine:

The North Dakota Atmospheric Resource Board (NDARB), a division of the State Water Commission, is charged with the regulation of weather modification (cloud seeding) activities in the state of North Dakota. Each summer, the North Dakota Cloud Modification Project (NDCMP) conducts airborne cloud seeding operations to enhance rainfall and suppress damaging hail in convective clouds from June through August. Flight operations are conducted 24/7 on an as-needed basis, with total flight hours ranging from 85-145 hours per season. Both project aircraft are based at the Bowman Municipal Airport in Bowman, ND.

The NDCMP currently includes Bowman and part of Slope County (District 1), which lie under the PR-3 expansion of the PRTC. Also, Gaps B and C MOA/ATCAAs adjacent to PR-3 are in close proximity to the operational area of the NDCMP. NDARB is concerned that PRTC operations may impair NDCMP cloud seeding aircraft from carrying out their missions. AM-13

The NDCMP has a significant impact on the local agricultural economy. A 2009 economic evaluation shows that cloud seeding operations in the area affected by the PRTC proposal contribute $3 million annually in additional crop revenues and $9.2 million in gross business volume. SO-28

PRTC Flight Operations

The draft EIS recognizes weather modification and cloud seeding as an affected activity in the proposed PRTC in several sections. The general recommendation for resolution of any conflict between NDCMP and USAF aircraft when the PRTC MOA is active is stated in Chapter 4.9.3.1.2:

> "For non-emergency flights, such as fire reconnaissance, U.S. Fish and Wildlife (USFWS) surveys, Angel flights, and cloud seeding, the pilot could coordinate with

900 EAST BOULEVARD AVENUE, DEPT 410, BISMARCK, NORTH DAKOTA 58505-0850
(701)328-2788 • FAX (701)328-4749 • TDD (701)328-2750 • http://www.swc.nd.gov/arb/

3006

> Ellsworth AFB to work to deconflict military operations. Weather modification flights need to respond rapidly to cloud formation and other meteorological conditions. Notification to Ellsworth AFB of the seasonable possibility of cloud seeding operations and notification of when and where cloud seeding was occurring would permit the Air Force to deconflict training missions."

Weather modification aircraft operations are primarily conducted under Visual Flight Rules (VFR) below FL180, however, Instrument Flight Rules (IFR) clearance is occasionally requested for "top-seeding" flights, which are typically conducted between FL160 and FL240. The draft EIS indicates that civil aviation would not be prohibited under VFR conditions even when the MOA is active, and that civil and military aircraft would operate under VFR see-and-avoid rules. IFR flights, however, would be prohibited when the MOA is active, a potentially significant impairment to effective cloud seeding operations.

This raises two questions:

- Will prior notification of Ellsworth AFB regarding active weather modification seeding flights in PRTC PR-3 deconflict the affected area under an active MOA to the extent that IFR cloud seeding flights are allowed?
- Will prior notification of Ellsworth AFB regarding active VFR weather modification seeding flights in PRTC PR-3 deconflict the affected area, or will civil and military aircraft operate under VFR see-and-avoid rules in the cloud seeding target areas during seeding operations?

AM-13

The proposed schedule for PR-3 Low/High MOA and PR-3 Low ATCAA is Monday-Thursday, 0730-1200 and 1800-2330 Local, and Friday, 0730-1200 Local. The expected daily use is three hours (MOA) and four hours (ATCAA) per day, respectively and 240 days per year. This constitutes a significant amount of time where USAF and NDCMP aircraft could be operating simultaneously.

Cloud seeding flights have been historically lower in number during the morning hours. This is primarily due to atmospheric stability that sets up overnight into the morning in a normal diurnal cycle. As the day progresses, surface heating begins to destabilize the atmosphere making the onset of convective clouds and precipitation much more likely. One way to significantly deconflict USAF and cloud seeding flights would be for the USAF to use PR-3 primarily during the morning block of scheduled time, as the likelihood of thunderstorms and cloud seeding flights is much greater during the

AM-13

3006

Ms. Linda DeVine
November 10, 2010
Page 3

afternoon and evening hours. Figure 1 shows recent NDCMP aircraft departure times by hour. The trough in seeding activities occurs from the early to late morning hours. AM-13

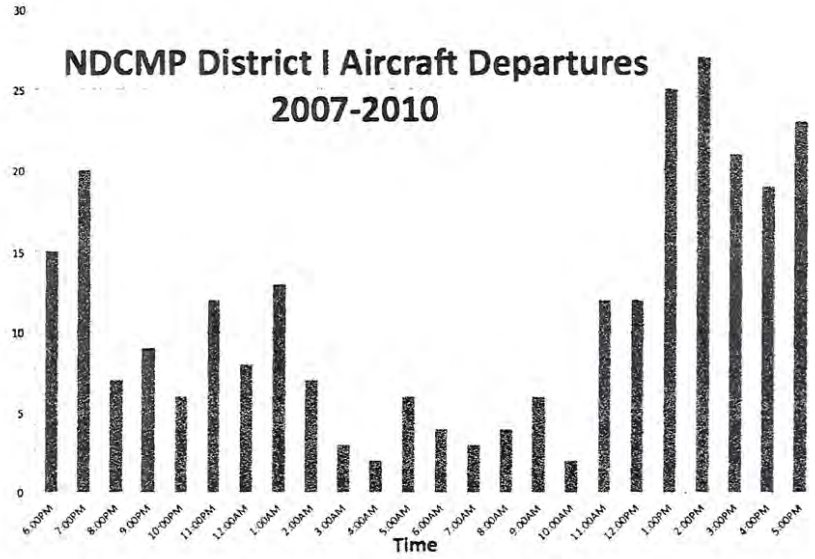

Figure 1. Total aircraft flight departures by hour for the seasons 2007-2010.

Radar Countermeasures

The draft EIS outlines in section 2.4.6.1 the planned use of chaff as a countermeasure to radar detection. The chaff fibers are said to vary in length from 0.3 to 1.0 inch. NDARB operates a C-band (5 cm wavelength) radar at the Bowman Municipal Airport to assist with weather detection and cloud seeding flight operations logistics. Chaff fibers of 1.0 inch (2.54 cm) are ideal for jamming 5 cm wavelength radar. Thus, it is entirely plausible to suggest that use of chaff during PRTC training exercises would produce high reflectivity radar echoes, which could be detected by the Bowman radar and not associated with clouds or precipitation. Further, prior research (Arnott et al., 2004) indicates that military chaff has very slow terminal fall speeds and can persist in the atmosphere for long periods, deposited many miles downwind. The draft EIS recognizes that chaff can be "detected by improved FAA radars, so to ensure that no chaff cloud SA-16

3006

interferes with ATC, chaff would not be deployed within 60 NM of airport approach radars."

- Due to the importance of radar during cloud seeing operations, will the USAF forgo the use of chaff within the same 60 NM range of the Bowman radar as it proposes with FAA radars?

SA-16

The proposed actions by the USAF regarding cloud seeding operations in southwest North Dakota help to mitigate concerns that PRTC activity would severely impair those operations. Further, proposed actions indicate that the USAF is willing to cooperate with existing users of the affected airspace so that all missions can be accomplished. However, NDARB requests further consideration of the aforementioned issues to ensure that this important and long-standing program can continue to be effective.

GE-11

Thank you for the opportunity to comment on the draft PRTC EIS. If I can provide further information, please feel free to contact me at 701.328.2788.

Regards,

Darin Langerud
Director, NDARB

BP Wind Energy

BP Wind Energy, NA Inc.

700 Louisiana Street,
33rd Floor
Houston, Texas 77002

713-354-2100

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB
VA 23665-2769

November 11, 2010

Dear Ms. DeVine,

On behalf of BP Wind Energy I am pleased to have the opportunity to submit comments for the record regarding the draft environmental impact statement that analyzes potential impacts of the proposed Powder River Training Complex.

BP is a company that invests in the most diverse energy portfolio in the industry. In the last five years, we have invested approximately $35 billion in the U.S. to increase existing energy sources, extend energy supplies and develop new, low-carbon technologies. With that investment have come needed jobs, a strengthened U.S. industrial base, export opportunities for U.S.-manufactured goods as well as property and other tax payments to communities and royalty payments to farmers, ranchers and other land owners.

Today, BP Wind Energy is one of the leading wind developers in the U.S. with a portfolio that includes the opportunity to develop some 60 projects across 22 states. In South Dakota we operate the Titan 1 Wind Farm in Hand County from which NorthWestern Energy, an investor-owned utility and one of the largest providers of electricity and natural gas in the northwest quadrant of the U.S., purchases the energy generated under a long-term power purchase agreement. The Titan 1 Wind Farm is part of a large wind complex that has the potential to be built out to over 5,000 megawatts which would make it the largest wind farm in the world with a capability to provide clean, renewable power to over 1.5 million average homes in America. In Wyoming and North Dakota we have the potential to develop further wind facilities.

bp

3007

Wind energy is an important national resource. It is domestic, inexhaustible, clean, and affordable. Wind energy is important for our national security, energy security and economic security. But, if we don't quickly develop a better system for engaging with federal agencies on airspace issues that includes the opportunity to work with the Defense Department and the military service branches to develop mitigation measures and reach compromise, wind projects will continue to be imperiled and the nation will fail to meet its energy goals.

GE-11

The wind energy industry understands as paramount the protection of national security and recognizes, of course, that in some instances, depending on location, wind farms can impact military operations. Very often those concerns can be addressed without compromising either national security or renewable energy goals. Decades of experience in developing wind farms in the US and around the world have demonstrated that wind energy development and military training can, and do, coexist. The key is transparency and cooperation.

Over and above the capital investment, BP's wind projects pay out $6 million annually in royalty payments to some 400 landowners. In addition, we have employed nearly 3,000 workers during the construction of our projects, created over 130 full time jobs to monitor and maintain the wind farms and BP Wind Energy pays in excess of $9 million every year in property taxes across 8 states.

Wind energy investments represent a long-term "win-win" opportunity for BP Wind Energy and the States of South Dakota, North Dakota, Wyoming and Montana, their communities and private landowners. The very significant modification of existing Air Force training airspace proposed in connection with the expansion of the Ellsworth Air Force Base would seriously impede future investment in the development of wind power in the region, and would threaten the region's ability to realize its full potential as a key producer of clean, renewable wind energy for the nation.

SO-17

BP Wind Energy stands ready to work together with the Air Force and all other stakeholders to preserve both wind energy development opportunities and the military mission assigned to Ellsworth Air Force Base. Many thanks for your consideration of these comments and we would be delighted to address any further questions or comments that you many have.

GE-11

Sincerely,

Larry Folks
Chief Development Officer
BP Wind Energy

RE: Draft Powder River Training Complex (PRTC), Ellsworth Air Force Base, South Dakota, Environmental Impact Statement (EIS) – August 2010

Dear Ms. DeVine:

Thank you for the opportunity to submit comment on the PRTC Draft EIS.

Crook County again reiterates its support of the United States Air Force (USAF) in its vital efforts to maintain homeland security and defend the nation. We recognize and support the important role that Ellsworth AFB plays and understand the goal to upgrade and expand operations so as to optimize resources and training opportunities.

The proposed action, Alternative A, appears to address several of our initial concerns. We strongly support flares being restricted in release altitude to above 2,000 feet above ground level (AGL), and the flares not being deployed during extreme fire conditions. The release altitude restriction should help to minimize fire risk from flares hitting the ground that are still burning. When an accidental deployment or malfunction does occur, however, there needs to be full disclosure and immediate action taken to protect county resources. SA-5

We also support the procedure regarding emergencies that requires unimpeded access to and from the airspace, and the promise that, in an emergency situation, the military aircraft will avoid the affected area, move into another active airspace, or return to base in accordance with the agreed-to procedures. SA-19

We remain very concerned about potential adverse impacts to historic uses in our county. Crook County's economy is based in natural resource related activities (ranching, mining, logging, recreation). The ability of private property owners to utilize their land and resources remains crucial to the area's economic stability. If the proposed action directly or indirectly prevents, impedes or delays economic development in Crook County, such as wind farms, mineral/energy exploration and/or extraction, communications towers, or historic economic activities, actions SO-22 SO-17

3008

should be taken on the part of the USAF to work directly with Crook County to mitigate those impacts. SO-17

We are also concerned about a disruption in important commercial and private aircraft use during the large force exercises (LFE). Close coordination is imperative for all affected entities, to address safety and other concerns. SO-6

The one-month notice in advance of an LFE should be adhered to, and we expect that, when properly notified, the USAF will continue to respect reasonable temporary or seasonal avoidance areas, such as for special ranch operations. NO-10

We support close coordination between the USAF, Crook County and other affected communities so that impacts can be minimized and the benefits of an expanded training complex can be realized. We urge the USAF to establish a direct communication connection to Crook County so that accurate information and important feedback can be exchanged in a timely manner. Monitoring and evaluation of the proposed action should be ongoing and **must** include input from local communities. GE-11

We look forward to being contacted to establish a direct line of communication with you.

Sincerely,

Jeanne Whalen

Ms. Linda DeVine
HQ ACC/A7PP
129 Andrews Street, Room 317
Langley AFB, VA 23665-2769

Dear Ms. Linda DeVine,

The Carter County Board of Commissioners would like to comment on the expansion of the Powder River Training Complex.

First, the Montana Governor, Senator and Head of the Department of Transportation do not believe there is "any thing in it for Montana", we disagree. Besides the many Montana troops serving in the Persian Gulf area, of which you provide air support for, Eastern Montana has some of the largest energy deposits in the world. Powder River and Rosebud Counties are sitting on one of the largest coal deposits in the world. Fallon, Dawson, and Richland Co are in the oil rich "Bakken" formation. Possibly more oil than the Middle East. As the world energy supplies continue to deplete, these reserves will surely look better and better to foreign countries. Without a viable air force to help protect these reserves of energy it will be all the easier for a terrorist from a foreign country to gain control. Therefore, along with protecting our troops, we feel there is something in it for Montana.

GE-1

Everyone is worried about the congestion of aircraft if the airspace is expanded. Most of Carter County has been used as a MOA every since World War II, without one near miss or mid-air collision. Expanding the airspace would only take some air traffic away from our area and spread it out over almost three times the square miles. The one concern we have is the lack of radar and radio coverage in the area. We understand, private and commercial aircraft would not be able to fly IFR through the area while the

AM-3

1

3009

MOA is in use. Would the Air Force be willing to work with the FAA and place some badly needed radio and radar equipment in the area to help solve some of these problems? AM-3

The Board of Carter County Commissioners is a three man board, we are all landowners and ranchers. Our prospective as landowners and ranchers is that there has been very little, if any, problem from these aircraft. If anyone has a problem, all they have had to do is call Ellsworth Air Force Base and ask to have their ranch put in a no fly zone. There are some ranchers who have asked to have this done during calving, lambing or other sensitive times for livestock; it has only taken one phone call to accomplish this. LU-7

We feel the benefits to the Air Force will out weight the sacrifices to the area affected, and are in favor of expanding the Powder River Training Complex.

COPY

RESOLUTION 11-05-10
RE: OPPOSITION TO THE PROPOSED POWDER RIVER MOA EXPANSION

WHEREAS, the Fallon County Commission is empowered, by Section 7-5-2101, MCA, to manage the business and concerns of Fallon County, Montana, as the Commission determines to be in the County's best interest;

WHEREAS, the Fallon County Commission has been notified of a proposed expansion to the Powder River MOA that will encompass an area including all of Fallon County;\

WHEREAS, the proposed MOA expansion will adversely impact Fallon County's economic development. It will limit the development of the local air corridor, regularly ground commercial and private aviation, interfere with local industry by increasing flight times and travel expense, and interfere with local agricultural operations and property; SO-7

WHEREAS, the proposed MOA expansion will adversely impact Fallon County's environment by increasing noise pollution and visual pollution, jeopardizing livestock herds and populations of wild game; LU-2 BI-4

WHEREAS, the proposed MOA expansion will adversely impact Fallon County's aviation safety by jeopardizing private pilots unused to dealing with military aircraft and protocols; SA-7

WHEREAS, Fallon County lies within a mineral-rich area, the continued development of which depends upon not unduly restricting local business operations;

WHEREAS, the costs of the local and regional impacts caused by the expansion of the MOA will far exceed than the proposed $8.5 million in savings realized by the U.S. Air Force. SO-17

NOW, THEREFORE IT IS HEREBY RESOLVED, that the Fallon County Commission hereby declares its opposition to the proposed expansion of the Powder River MOA, and urges the rejection of the U.S. Air Force's expansion plan. GE-2

Dated this 5th day of November, 2010.

Yes, please include me in the mailing list for distributing the Final EIS. I would like to receive a copy in: ___ CD (electronic format)
___ hard copy format
No, please do not include me in the mailing list for distributing the Final EIS. I do not wish to receive an EIS or further information.

PLEASE NOTE: This Draft EIS is provided for public comment in accordance with the National Environmental Policy Act (NEPA), the President's Council on Environmental Quality (CEQ) NEPA Regulations (40 CFR §§1500-1508), and 32 CFR §989, Environmental Impact Analysis Process (EIAP).

The EIAP provides an opportunity for public input on Air Force decision-making, allows the public to offer inputs on alternative ways for the Air Force to accomplish what it is proposing, and solicits comments on the Air Force's analysis of environmental effects.

When making an oral comment, please clearly state your name and the name of the organization, if any, which you are representing before you begin your comments. Please do not provide any other personal information, such as your home address and phone number when making an oral comment. Your oral comments will be used to develop a transcript and permanent record of this meeting. This transcript will be will be published in the FEIS. If you would like a copy of the Final EIS or other associated documents, you may state that on a written comment card or add your name and address to the mailing list.

Providing personal information is voluntary. If you choose to not provide personal identifying information, your comments will be given the same weight and consideration as any other comments submitted. Private addresses provided will be compiled to develop the mailing list for those requesting copies of the Final EIS. Only the names of the individuals making comments and specific comments will be disclosed. Personal home addresses and phone numbers will not be published in the Final EIS.

Please hand this form in at a public hearing or mail before November 13, 2010 to:

UNITED STATES AIR FORCE POWDER RIVER TRAINING COMPLEX RESOLUTION

WHEREAS, The United States Air Force and Ellsworth Air Force Base is proposing an expansion to its Powder River Training Complex, and

WHEREAS, there is concern among the citizens of Adams County and the Board of County Commissioners regarding the safety of the citizens if the expansion is approved, and

WHEREAS, the expansion has the potential to endanger the local pilots and aircraft that regularly fly within the airspace in Adams County for ranching and agricultural purposes, and SA-9

WHEREAS, because the citizens of Adams County enjoy the safety and tranquility that comes with the lack of population in our area, and LU-2

NOW, THEREFORE, BE IT RESOLVED, that the Adams County Board of Commissioners strongly oppose the expansion of the Powder River Training Complex within the boundaries of Adams County, and feel it is the County's responsibility to protect the safety, livelihood, and way of life of the citizens of the County. Ms. Linda Devine
HQ ACC/A7PS
129 Andrews Street - Suite 337
Langley AFB, VA 23665-2769

11/09/2010

Ms. Devine;

I have expressed my concerns & opposition to this expansion at both the scoping meetings & the EIS public hearings. I have also met with a committee and the Air Force in a private meeting. I feel this effort has fallen on deaf ears & the Air Force is only concerned with pushing this forward. I have asked at every meeting how IFR traffic can transition through and operate safely in this area without radio and radar coverage when it is active. The question has never been answered, because it cannot and will not be done. VFR transient aircraft will simply avoid this special use airspace whether it is active or not. That is the way VFR pilots are trained.

AM-3

AM-21

There are many problems with the EIS. Land values – not significantly impacted. How can you say this when there has been no studies, appraisals, or any thing else done but a simple statement. This goes for non-military aircraft airspace use, damage to property, wildlife, and economic impact as well. There have been no studies on any of these points to determine the true impact of this proposed expansion. The whole EIS is full of maybe, probably, possibly, and all the other vague terminology. The Air Force is not telling the whole story, just like it was originally proposed in the scoping meetings as only used 10 days a year for the LFE's. Now it is stated up to 44.5 hours per week!

SO-1

SO-22

NP-9

PN-5

Sage Grouse impact will be minimal & will acclimate to this environment? Mineral exploration & construction projects are currently halted during mating season. Bird strikes are seen as infrequent. The endangered species Whooping Cranes are known to migrate through this area. I guess if you kill a flock of them, oh well!!

BI-3

SA-10

As for water and soil pH, the EIS says it is neutral to slightly alkaline. I do not know where the Air Force gets their information, but the water and soil pH in this area are high to very high alkaline. Another case of a incorrect environmental information. Look around. What are all whites spots on the ground!!

PR-1

This area is very mineral rich and exploration and production companies travel frequently to this area either by airlines or private aircraft. We are currently expanding KBHK to handle these needs. We have spent approximately $5 Million on this airport with another $2-3 Million to be spent next year alone. What are we going to do with this airport when it cannot be used effectively and safely?

SO-10

11/09/2010 12:33 FAX 14067783538 BAKER AIR SERUICE 002

3012

Baker Municipal Airport Commission

P.O. Box 1037 • Baker, MT 59313 • 406-778-7108

The EIS states 285 based civil aircraft under this proposal. My count is over 600 with 214 in Montana alone, based on the FAA Aircraft Registry. The EIS also states 39 airports underlie this area. There are over 40airports in Montana alone. Again, false information. The EIS is incomplete & has not addressed the environmental concerns adequately. AM-4

VFR "See & Avoid" would be legal under this proposal but it will be flat out dangerous to both civilian and military aircraft to fly at the proposed speeds. Civilian aircraft will avoid this special use airspace like a plague. SA-7

Small airports will not survive this impact. Student instruction will be impossible as well as flat out dangerous. Fuel sales will dwindle. Jobs will be lost & the local economy will suffer. This proposal may save the Air Force $12 Million per year, but it will cost the state on Montana in excess of $100 Million per year in lost jobs & revenue. SO-26 SO-5

The opposition to this is expansion is huge. Letter groups (AOPA, MPA, MAMA, MATA, NBAA) consisting of over 500,000 combined members are opposing this expansion. Will you hear us? NP-1

I am not saying this expansion is bad or not needed. It simply does not belong in Montana or any other area where the impact will be so great. Montana has nothing to benefit from this expansion. PN-2

The No-Action Alternative is the only option that is acceptable to Montana. GE-2

Roger Meggers
BHK Airport Manager.

Linda Devine, Program Manager
ACC/A7PS
129 Andrews St., Suite 337
Langley AFB, VA 23665-2701

Dear Ms. DeVine,

The purpose of this letter is to convey my support as Chairman of the Ellsworth Task Force for Alternative A of Air Combat Command's Powder River Training Complex Environmental Impact Statement, dated August 2010. GE-1

Being a third generation supporter of Ellsworth Air Force Base as a pinnacle of our nation's defense capabilities, I am aware of the necessity of our nation's armed forces to be able to successfully complete combat operations. Towards that objective, I am fully supportive of providing them the airspace in which to fully hone their combat skills so as to be able to both protect themselves and defeat our nation's adversaries in the most effective and efficient manner. GE-9

As the technologies of modern warfare have provided our forces the resources with which to optimize their weapons systems, it is evident that the minimal sacrifices and impositions imposed by such training are within the parameters of acceptable commitments of our citizenry. Accordingly, I am committed to the success of your initiative to provide the airspace required to successfully complete such training missions. My endorsement of Alternative A is further founded on the efforts Air Combat Command has made to accommodate those citizens affected by training flights and the knowledge that Ellsworth's leadership team will continue to fully consider special requests for such considerations. GE-11

Thanking you in advance for this pioneering work in combat aviation training, please do not hesitate to contact me as we proceed with the realization of the best training complex our nation has developed in the past fifty years.

Sincerely,

Chris Lien, Chairman
Ellsworth Task Force

Dear Ms. DeVine:

Enclosed is a copy of a resolution which passed before the City of Lemmon Council on October 4, 2010. Our concerns are not only for the residents of the City of Lemmon but our surrounding area as well. We are a rural area that enjoys the peace and quiet of the country. We feel that this will be an unfair burden and expense on our rural area.

Your consideration in not expanding the Powder River Training Complex to encompass the City of Lemmon and its surrounding regional trade area would be greatly appreciated.

Sincerely,

Neal Pinnow
Mayor

Enclosure

3014

City of Lemmon
State of South Dakota
Resolution 2010-5

Whereas, the United States Air Force has announced the expansion of the Powder River Training Complex to encompass the City of Lemmon and its surrounding regional trade area; and

Whereas, the City of Lemmon consists of many patriotic citizens that support our military forces with their personal sacrifice and moral support; and

Whereas, the City of Lemmon has contributed, along with the state and federal government, to the improvement and expansion of the Lemmon Municipal Airport at Ray Kolb Field; and

Whereas, the expansion of the Powder River Training Complex would adversely affect air traffic in and around the Lemmon area; and

Whereas, the interruption of air traffic for any specified period of time will undoubtedly cause negative economic impact; and — SO-8

Whereas, wind development and any other types of tower development may be stymied by the expansion of the Powder River Training Complex; and — SO-17

Whereas, our larger sister cities of Spearfish, Rapid City, Sturgis, Belle Fourche and larger cities lying outside of South Dakota including Dickinson, Bismarck, Miles City and Gillette will not be included in the Powder River Complex Expansion and unfairly targeting lower population areas to carry the brunt of this training area; and — EJ-2

Whereas, the City of Lemmon derives its economic base and existence from agriculture, including the production of livestock and management of thousands of acres of grassland that could be endangered by the increase risk of fire; and — SA-5

Whereas, agricultural producer's property values will likely suffer from the military activity that will take place in many cases five hundred fifty feet above their property, cause noise, inconvenience and a breach of quiet enjoyment of their property; and — SO-1

Whereas, the private property rights of area landowners will be infringed upon by the expansion of the Powder River Complex Expansion; and — GE-7

Whereas, other private property owners are compensated when the government devalues property and are deemed a taking; and — SO-1

Whereas, the Air Force has alternatives for training exercises and the expansion of the Powder River Complex is not necessary; and — PN-2

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms DeVine:

The Minot Area Chamber of Commerce is a long time supporter of the US Air Force. We have over the last number of years even proposed an expanded MOA in North Dakota for the exact type of training exercises that are envisioned to occur within the expanded Powder River Training Complex.

Having reviewed the Draft EIS, the Minot Area Chamber of Commerce supports the preferred Alternative identified in the process. We support this alternative for a number of reasons. First, the proximity of the training complex would allow the airmen flying the B-52 to train in a manner in which they would in real world situations. Also, the proximity to the training complex would reduce the costs of training in a time where budgets will continue to be tight and training is an important component to our airmen winning the fight. Additionally, the proximity to the training complex would also mean a higher quality of life for the airmen and their families because of less time away from home for a TDY on a training exercise. GE-1 PN-2

The Chamber did note a number of concerns identified by landowner groups located in and around the complex. We believe that those concerns can be met or mitigated by identifying avoidance zones similar to areas called out for avoidance because of Native American sacred grounds. Conceivably this could include round-up areas, birthing areas, watering holes and the like. We encourage the Air Force to pursue these types of arrangements with the affected landowners. NO-10

Again, the Minot Area Chamber of Commerce supports the preferred alternative identified in the draft EIS for the expanded Powder River Training Complex. GE-1

Respectfully,

Brekka Kramer
Brekka Kramer,

129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine:

Verendrye Electric Cooperative (VEC) has the privilege of serving the electrical needs of the Minot Air Force Base and a majority of the missile sites in the area. Not only is the USAF our number one key account but more important, we consider the men and women of the MAFB our friends and neighbors. In fact, a number of retired servicemen and their families live here in the Velva area. We certainly support the efforts to expand the MAFB's military training airspace and their flying mission.

Having reviewed the Draft EIS, VEC supports the preferred alternative identified in the process. VEC supports this alternative for a number of reasons. First, the proximity of the training complex would allow the airmen flying the B-52 to train in a manner in which they would in real world situations. Also, the proximity to the training complex would reduce the costs of training in a time where budgets will continue to be tight and training is an important component to our airmen winning the fight. Additionally, the proximity to the training complex would also mean a higher quality of life for the airmen and their families because of less time away from home for a TDY on a training exercise.

GE-1

PN-2

Again, Verendrye Electric Cooperative supports the preferred alternative identified in the draft EIS for the expanded Powder River Training Complex which would be a great benefit to the MAFB.

GE-1

Very truly yours,

Randy Hauck

ExecutiveAir TaxiCorporation

A Premier Aviation Center

Date: 11-11-2010

RE: Powder River Training Complex

TO: Whom it may concern

Executive Air Taxi Corporation is a full service Fixed Base Operation (FBO) in Bismarck, ND providing a wide range of aviation services to the not only local operators but we service aircraft from throughout the nation that fly into the Bismarck Airport. Our services include Aircraft Charter Services with clients that fly to various destinations including communities that lie within the proposed Powder River Training Complex (PRTC) Airspace.

Our charter service includes providing air transportation of local medical physicians and medical personnel to much of the rural areas within the PRTC. Many of those transports are scheduled well in advance and bring much needed medical services to individuals that rely on having medical care brought to those communities. The active proposed MOA will cause the cancellation of those prescheduled flights. SO-5

Executive Air also provides aircraft refueling to many organizations from around the country who find Bismarck to be an ideal fuel stop due to our geographic location. This has a tremendous economic benefit to the airport, the Bismarck /Mandan communities and the entire surrounding region. Bismarck is the regions hub for air service, air freight, medical transportation and EMS medical services. The proposed MOA will have a negative effect on all of these operations and services and have a dramatic effect on our business as well. SO-10 SO-5

We also provide Emergency Medical Helicopter Services to the rural region. Although it is stated that EMS flights will have priority, those flights are most often non-scheduled and need to respond to an emergency on a moments' notice. The people who live in these remote areas rely on these services for their health and well-being and it is also a tremendous economic benefit to the entire region to have the emergency medical services available. SA-19

The area directly under the proposed MOA is also rich in energy production and with it requires the need for many companies to travel to this area by air. The proposed MOA will cause increased costs and delays by having to divert around the MOA. This will have a negative effect on their ability to efficiently conduct business here and that in turn will not be in the best interest of North Dakota. SO-8

Executive Air supports our military and our service men and women. We also reply on the airspace that is provided to all of us. Given the affect the MOA will have on our business, city, state and region, Executive Air does not support the proposal. Feel free to contact me anytime. Thank you. GE-2

Respectfully,

Paul Vetter

RE: POWDER RIVER TRAINING COMPLEX PUBLIC COMMENT

Dear Ms. DeVine:

The Board of Harding County Commissioners have directed me to submit a public comment on behalf of Harding County concerning the proposed changes to the Powder River Training Complex. While it is understood by the Board that it is vital to the security of our nation that this training be done, there is also concerns about the safety of our residents and the impact that the training will have on their livelihoods.

We would ask that the following be carefully considered and adapted into the Training Complex standards:

1. All aircraft will fly no lower than 1000' to ensure the safety of our local pilots that use aircraft for their day to day operations. PN-4
2. Local pilots will be notified of the training schedules to eliminate any confusion and possible conflict with local flying patterns. AM-12
3. All public and private airports and runways need to be identified within the proposed Complex training area and taken into consideration when developing the training pattern. Training aircraft must stay at least one mile away from the identified areas and stay at least 1000' above the ground. AM-4 PN-4

We would like to thank you for taking the public comments that have been submitted to you seriously. This is important to the people that the Board of Commissioner's represent and the safety of your pilots, as well as our people, and is vital to the success of this program.

As directed by the Harding County Board of Commissioners on October 5, 2010.

Sincerely,

Kathy Glines

THE INTERNATIONAL ASSOCIATION OF NATURAL RESOURCE PILOTS

Ms. Linda DeVine
HQ ACC/A7PP
129 Andrews Street, Room 317
Langley AFB, VA 23665-2769

11-9-10

I am the President of the International Association of Natural Resource Pilots and am responding to the proposed Powder River Training complex (PRTC).

Natural resource aviation is made up of aircraft operators using fixed wing and rotor wing doing aerial operations from surveys to enforcement. These operators are made up of state, federal and private organizations.

Our members and non members alike are concerned about safety and efficiency. The expansion of this airspace would cause flight delays and cancelations and with weather restrictions some work would simply not get done. I realize that this would not be a "Restricted Airspace" but operating in a see and avoid environment with closing speeds of 400 to 500 mph is unrealistic and dangerous. SO-8 SA-7

The IANRP opposes any increase in the size of the existing Powder River MOA and ATCAA and recommend the "No Action Alternative" GE-2

Re: Powder River MOA Proposed Expansion

Dear Ms. LeVine:

I am writing on behalf of the Lawrence County Commission concerning the Powder River MOA proposed expansion. This matter is of great concern to the Commission.

In the last several years, over $10 million of federal/state/local taxpayer monies have been spent in furtherance of several projects at the Black Hills Airport/Clyde Ice Field. Improvement projects are ongoing and an additional $7 million (approx.) has been committed for current projects. As detailed in the bullet points below, the proposed expansion of the MOA shall have significant adverse economic impacts on Black Hills Airport. A subset of the adverse economic impacts is significant interference with air traffic in the region. SO-10

Of critical concern is that at the time data was being compiled for the Environmental Impact Study, the primary runway at Black Hill's Airport was closed for lengthening and re-construction. Therefore, it must be concluded that any such data collected during this period is inaccurate and requires re-evaluation. AM-4

- Black Hills airport ranks #5 of 34 public use airports within the study area for annual operations and is **not shown** on prepared maps.
- During the time data was compiled Black Hills airport's primary runway was closed for lengthening and re-construction with a total investment of approx. 10 million dollars.
- The County is currently moving forward with a full-length parallel taxiway project with a price tag of approx. 7 million dollars.

EQUAL HOUSING OPPORTUNITY

EQUAL OPPORTUNITY EMPLOYER

3023

- Owing to recent expansion at Black Hills Airport, the process of developing new LPV approaches to runway 13/31 for category A, B, & C aircraft is underway. IFR capabilities throughout this construction period have been curtailed or significantly reduced.
- Expanding the MOA to an area of 37,800 Sq. Mi. (Larger than the state of Indiana) will have a **dramatic effect** on air travel to and from the Black Hills Region. AM-6
- IFR traffic to or from any area north of the Black Hills will be **significantly impacted**, and such traffic may very well chose an **alternate destination** - even though the Black Hills region is the most popular destination for recreation/tourism within hundreds of miles. SO-9
- VFR "See and Avoid" as proposed in the planning document will result in increased risk to flight safety assuming a pilot is able to conduct flight under VFR conditions considering a closure rate of **800 plus knots**. (B-1 pilot stated 580 kt. Airspeed as normal within the MOA)
- FAR 91.117 requires a civilian pilot to reduce speed to below 250Kts. Anytime one is below 10,000 ft. to provide an opportunity to "See and Avoid" (Max. potential closure rate **of 500 Kts.)** SA-7
- Exemption #7960C authorizes the USAF to operate in the Powder River MOA "**Lights-Out**" at night to practice night vision goggle usage and yet we are told to feel safe flying through the MOA after dark VFR "**See and Avoid"?** AM-7
- As stated in the EIS, Radar coverage is **unavailable below 8000 ft.** which will provide no help for a VFR flight through the MOA. AM-3
- With the proposed MOA extending from 500 ft. AGL up to 60,000 ft. it will be **impossible for IFR** traffic to transition through this area when the MOA is active mon. thru fri. 6:00 AM till Noon and again mon. thru thurs. from 6:00 Pm till 11:30 PM or other times when activated by NOTAM.
- The three corridors along Victor airways would allow IFR traffic through below 18,000' except during Large Force Exercises. These corridors do **little to mitigate** the impacts to the Black Hills and most IFR traffic would generally fly above 18,000' due to weather as well as operating efficiency. AM-21
- Restrictions on IFR traffic through the MOA would not only have **significant economic impact** on businesses at the airport, but also to all commercial airline traffic that traditionally flies over this area as they are incapable of flying above 60,000'. SO-10
- The EIS does nothing to address **the economic impact** of this proposal other than stating a "Potential Economic Impact" to General Aviation. SO-22
- If the MOA were to be expanded as proposed, it can be reasonably expected that there will be a significant reduction in fuel sales at the Black Hills Airport. This will result in a SO-10

3023

loss of flowage fees collected. These flowage fees are used by Lawrence County to help offset the operational costs of this public use airport. SO-10

Accordingly, the Lawrence County Commission requests that the area of the proposed MOA be reconsidered not only to account for the fact that the primary runway at Black Hills Airport was closed during the data collection phase, but also that a more detailed study of the adverse economic impacts on the local and regional community must be completed. It is important that these impacts be identified and properly evaluated. It is expected that once an appropriate re-evaluation is made, it will support a reduction in the area of the proposed MOA area to include relief for Black Hills Airport. AM-4

Thank you in advance for your time and consideration in this matter. Do not hesitate to contact me should you require more information, or in the event questions arise.

Sincerely,

Connie H. Douglas

Reference: (1) Powder River Training Complex Draft Environmental Impact Statement (EIS)
(2) FAA Airspace Study 10-AGL-6NR

Founded in 1947 and based in Washington, DC, the National Business Aviation Association (NBAA) is the leading organization for companies that rely on general aviation aircraft to help make their businesses more efficient, productive and successful. The Association represents more than 8,000 companies and provides more than 100 products and services to the business aviation community. On behalf of our membership, we submit the following comments in response to the Powder River Training Complex Draft Environmental Impact Statement (EIS).

NBAA and its members are supportive of the need for the men and women in our armed forces to be able to "train as they fight" and are grateful for the service and sacrifice of the men and women in our armed services. GE-9

Unfortunately, NBAA is unable to support the majority of the Proposed Action Alternative A of the PRTC Draft EIS. USAF has gone to substantial lengths to describe and justify the 4 quarterly Large Force Exercises lasting 1 to 3 days each per calendar year. NBAA is supportive in general of this portion of the proposed action provided mitigations such as increased radio and surveillance coverage are installed in the region to provide safety buffers for civil aircraft operating VFR in the MOAs or operating IFR/VFR near the MOAs. AM-3

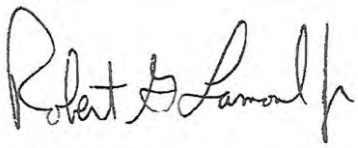
However, USAF has provided no justification, nor does NBAA believe any justification could be sufficient, to allow for the proposed MOA/ATCAA activation outside the quarterly LFEs. To activate MOA/ATCAAs on a Monday through Thursday, 7:30am to 12:00pm and 6:00pm to 11:30pm and then on Fridays from 7:30am to 12:00pm is an immense and unjustified expansion of military airspace covering portions of three States that will have devastating impacts on the economics of several NBAA member companies located throughout the region as well as impacting numerous NBAA members overflying the region in the en route structure. The USAF provided no justification whatsoever for the expansive MOA activations and USAF failed to make a minimum effort to offset even a small portion of this massive increase in airspace by offering to give up the Tiger, Devils' Lake, Hays, and Lake Andes MOAs which even the AF acknowledges "were created and configured for Cold War era missions". PN-3 SO-22 PN-3

As it stands in the coordination process, it seems there still has been no national-level look at the impact to Transcons in the NAS by the FAA if Proposed Action Alternative A were approved as drafted by USAF. Regrettably, we cannot support this initiative at this time without serious work being done to drastically scale back the non-LFE portion of the proposal. SO-22

3024

Additionally, I have enclosed two letters from NBAA members that are typical of our member's deep concerns over this current proposal.

Sincerely,



Robert G Lamond Jr
Director, Air Traffic Services & Infrastructure

September 28, 2010

Ms. Linda DeVine, Program Manager
ACC/A7PS
129 Andrews Street, Suite 337
Langley AFB, VA 23665-2701

Dear Ms. DeVine,

Basin Electric Power Cooperative is responding to the proposed Power River Training Complex (PRTC). Basin Electric Power Cooperative (BEPC) is a regional wholesale electric generation and transmission cooperative serving more than 120 member systems. These member systems provide power and services to more than 2.6 million consumers in nine states and covers more than 430,000 sq. miles in these nine states and is based in Bismarck ND.

BEPC is strongly against any increase in the size of the existing Powder River MOA and ATCAA. Basin Electric recommends the "**No-Action Alternative**". BEPC believes the No-Action Alternative is the most responsible choice for the following reasons: GE-2

- Adverse Financial Impact – BEPC is constructing a new 1.4 Billon dollar electrical generating plant 6 miles NE of Gillette, WY. Construction will be completed in 2011 and operations are planned for a minimum of 50 years. This facility is called "Dry Fork Station "and requires air transportation of employees and consultants from our headquarters in Bismarck, ND to the Gillette Airport several times each week. BEPC has three business aircraft that we use to fulfill that and many other missions for BEPC. Currently the Power River MOA and ATCAA already have a negative impact on our flight operations and the proposed enlargement to the PRTC will have an even more negative impact in both direct operating cost with extra miles flown, loss of productive time of the passengers, and also safety with weather conditions (thunderstorms) block the sides of this PRTC giving no alternate routes. The general location causes coordination problems with Denver, Salt Lake, and Minneapolis ARTCC facilities. Two of our aircraft can climb and fly over the top of the existing MOA and ATCAA, but not the proposed tops of 60,000 MSL. SO-7

  Over the last three (3) years, BEPC has flown 1,791 flights into some part of the proposed Powder River Training Complex. BEPC has flown 316 trips annually between Bismarck and Gillette (286 miles one way) which if going direct between these two Cities is 90,376 miles. SO-22

3025

Page 2

At our direct operating cost (DOC) gives a yearly expense of $442,242. If BEPC has to avoid PRTC, this now gives a trip distance of 386 for 316 trips annually or a cost of $596,292. The additional cost to avoid PRTC would be $154,050 annually or $487.50 per flight.

If I used that average additional expense for the other 281 flights that go through the proposed PRTC would have a negative cost of $136,988 per year. Add this to the Bismarck to Gillette flights and I get $291,038 annual direct operating cost increase. This does not include any employee loss of productivity time or salaries.

SO-22

- Fuel – Training aircraft, commercial airline flights, business aircraft, and general aviation will have to use more aviation fuel if the PRTC is approved. With today's fuel prices and economic conditions, conservation of fuel should be the goal.

SO-7

- Alternate Training – BEPC uses Level D full motion flight simulators for initial and recurrent training. Basin has also seen the complex training simulators for the F-14 and B-52 aircraft. Basin believes that with today's advance computer technologies, military flight simulators can be used for training in a safer and more efficient environment. If actual training flights need to occur the use of the current Power River MOA and ATCAA should be adequate. If other size areas are required only a couple times a year, then there are many military areas to choose. For example on 06-23-2008, the internet shows over 720 different military areas. The military does not need any more areas.

PN-7

- Speed – Allowing greater than Mach 1 speeds and above in anything except positive controlled airspace could be very unsafe. Allowing that type of speed above 10,000 MSL and having VFR traffic near-by would give a very short reaction time to see and avoid.

SA-7

- Chaff – Many of the rural electric consumers rely on the grasslands for their income and any fires that can be prevented would be the only responsible risk management plan. Many of the lands underlying the proposed PRTC are not readily accessible by rural fire departments and with the typical dry conditions, a grass fire could be not only financial devastating, but could in worse case be harmful or fatal.

SA-5

- Attendance – BEPC staff attended the scoping meeting held in Bowman, ND. In talking during this meeting to some of the military folks that all the previous meeting had only 177 people attend says volumes on the ineffectiveness of getting people to attend. Why not a meeting in Bismarck, this proposed airspace is almost to the border of our FAA approach airspace to the southwest?

NP-8

- If the PRTC continues, then several **SAFETY FACTORS** need to be resolved.
  - 30 distance between PR4 and Bismarck airport. Normal aircraft factory recommendations for descents would require Basin's Citation Model 560 to be 17,000 MSL and be either 33 or 43 miles from the airport depending on the type of descent. If the high MOA is active, then we cannot comply with the Factory recommended descent profile. If any of the ATCAA's are active, then the problem gets worse and safe operation would be compromised. Leading air ambulance turboprop would need to start out of altitude 46 miles from Bismarck at a factory recommended 1,500fpm descent. The local Bismarck air ambulance piston twin would need approximately 42 miles to descent from 17,000 to traffic pattern in Bismarck.

AM-5

3025

Page 3

The distance from the edge of the MOA/ATCAA is too close to the airport. This distance would be near the same at other airport that would be bounded by the proposed PRTC. A sixty (60) nautical mile radius from IFR airport to the edge of the PRTC would then allow normal and safe operations. AM-5

- There needs to be communications coverage for all of PRTC at all altitudes to control, de-conflict and cover other non-standard operations.
- There needs to be ATC radar coverage for all of the PRTC within the low and high MOA for the FAA's ARTCC to control and monitor all aircraft within the MOA and ATCAAs. AM-3
- FAA ARTCC boundaries need to be modified so one "Center" has control of all aircraft in the PRTC. There are many time requests are not handled in a timely manner due to the coordination required between centers facilities. AM-1
- Real time data on status of PRTC needs to be available for everyone to see. No changes within 36 hours should be allowed by the FAA except if already planned usage is cancelled. AM-12

Basin Electric Power Cooperative again is strongly against this proposed Powder River Training Complex and hope that this proposed Powder River Training Complex proposal will be cancelled. GE-2

Sincerely,

Fred E. Adams

RE: Powder River EIS

TO: Whom it may concern

Bismarck Aero Center (BAC) is a Fixed Base Operator (FBO) located at the Bismarck Airport (KBIS) and is a subsidiary of Aircraft Management Services (AMS). We have been in business at the KBIS airport for 20 years. As a FBO we wear many hats and service many areas of aviation. We are an avid supporter of our military and its contribution to our freedoms. Our main revenue comes from ground support of the flying public. We have many concerns pertaining to the proposed expansion of the Powder River MOA.

As a provider of aviation fuel 30 % of our fuel business comes from transient aircraft. The implementation of the proposed changes would encourage our cross country clients to find other stops that were more predictable and less inhibited by restrictions that reroute IFR traffic. This alone could cost us in excess of $300,000 in gross revenue annually.

There are approximately 80 medical flights that originate in Bismarck monthly. Not all of these flights originate at our facility; however all of them require maintenance, and purchase fuel and require storage at this airport. These flights service the small communities such as Hettinger and Bowman in North Dakota and some of the western cities in eastern Montana with medical services that are not readily available in the small rural communities. These teams can be more efficient and flying adds economic value to them and the community. The proposed MOA expansion would cause cancellations and delays that would soon render these services too expensive to provide and these services would no longer be available to the rural communities. SO-8

Under this proposal there are provisions to accommodate air ambulance flights. Air ambulance flights are rarely scheduled and as implied are needed on the spur of the moment. The lack of communication in the MOA would imply that this MOA could not be cleared without delay to a life flight request. These could cause life and death delays. The EIS states that most of these flights are conducted below 10,000 feet witch is a statement that is not the norm any more. Most lifeguard flights today are provided by high performance pressurized aircraft capable of flight in excess of 25,000 feet. These high flights satisfy the need for increased safety and comfort for the passengers. SA-19 SA-18

Our Upper Midwest economy is spurred by energy development. Oil and energy companies fly daily trips from out of this area transporting teams of specialists in and out of the area. The expansion of this MOA will cross the direct route of many of these flight and cause delays that will have a negative effect on the their respective companies and the state of North Dakota. SO-8

Charter operators provide flights into these rural areas that are proposed to underlie the expanded MOA's. These operators operate under a more stringent set of rules and the uncertainty and unpredictability of these airspaces will cause significant delays to these operators. SO-8

North Dakota has a very high use of agricultural aircraft used to apply pesticides to growing crops. With the amount of productive acres that lie below the proposed expansion and their need for these services, the exposure to conflict with military aircraft multiplies exponentially during the application season. Regulation suggests that once these heavy less maneuverable aircraft apply their load and start back to the airfield to reload that they maintain an altitude of 500 feet SA-15

3026

or greater AGL and that puts them in conflict with low flying military aircraft. With agriculture being the mainstay of the North Dakota economy, any delay would have a huge economic impact on the state and it's producers. SA-15

The EIS makes provisions for the existing Victor airways however these airways are scheduled to be phased out. The FAA and NASA are working on a transportation system of point to point navigation and the satellite GPS is the heart of this system. With the new Technically Advanced Aircraft designs, all navigation will be point to point. AM-16

During my review of this document I found numerous areas of incorrect documentation and misinformation. Page 3-153 attempts to chart agricultural acres and revenues but is not representative or logical in its presentation. The figures are erroneous. I reviewed the charts representing charted flights through the proposed airspace. Some of these charts (Figure 3.1-13.)referred to flights below 4,000, feet. There is no radar coverage below 6-8,000 feet in most of this area so I find this documentation misleading. If these pages are representative of this document, then this document is misleading and not factual at best. LU-4 AM-31

I have been flying in excess of 45 years and all of my flying has originated in North Dakota. I have been flying into and around the existing MOA's my entire flying career. My experience has been that posted "HOT" times have rarely been adhered to and that popup times are the norm. I have had more delays when the MOA was not scheduled and all of a sudden became "HOT". AM-12

The Bismarck Airport is the gateway to Bismarck North Dakota, our states capital. Implementation of this proposal, added to the proposed changes in the airspace to the northeast (EIS for the use of RPA's, Grand Forks, ND) would virtually cripple air commerce into and out of the Bismarck Airport. This virtually affects every citizen of the Bismarck/Mandan area. SO-5

Thank you for your time. I may be reached at 701-223-4754 or at bobs@bismarckaero.com.

Respectfully submitted,

Bob Simmers

President

Written Comment Sheet
Public Hearing for the Proposed Powder River Training Complex

Thank you for your input! **DATE:** 11/03/10

PLEASE PRINT

I attended the public hearing held at Hoth, ND. I was disappointed with the opposition to the expansion. Since the hearing the media continues to print concerns of those not in favor of expansion. I remember the training flights of years ago. I don't remember opposition.

As far as airplanes making noise, so do the barking dogs belonging to a dog trainer a few blocks from my home. One speaker had his cattle spooked by an airplane. I also own cattle and have had them spooked by snowmobiles, deer, coyotes, dogs, and housecats. Another speaker suggested that aerial crop sprayers would be affected. I aerial crop spray and the airforce won't hinder my operation.

I would welcome activity in our area of Southwestern ND. They're GE-1

Subject: Draft Environmental Impact Statement for Powder River Training Complex

Dear Ms. Devine:

The Montana Department of Transportation (MDT) supports and understands the importance of training our United States Military but remains very concerned with the current proposal to expand the Powder River Training Complex for many reasons:

- Montana is home to the Hays MOA in north central Montana and the current Powder River MOA. We are happy to share our airspace as currently provided but feel that if expansion is necessary, it should occur in North and South Dakota where the air bases are located. PN-2
- The EIS does not consider all possible alternatives. It must include considerations to expand the Devils Lake, Tiger and Lake Andes MOAs under the same criteria as the existing Powder River MOA.
- These existing MOAs could offer accommodation with less impact.
- The communication and use regarding the proposal has been confusing and portrayed as only 10-days per year. The impact of approximately 240 days per year needs to be analyzed and clarified. PN-5
- The revised proposal eliminated impacts to the Billings, Bismarck and Dickinson airports. The same must be done for Montana's other public and private airports located underneath the MOA. There is no provision for airborne access to Ashland, Baker, Broadus, Colstrip, Ekalaka, Hardin or the 40+ private airstrips located in southeast Montana. AM-5
- The EIS information on the number of airports underlying the Powder River Training Complex is underestimated at 39 airports. Montana alone has close to 50 airports underneath the proposed MOA.
- The EIS states that the number of airports and airfields located under the proposed MOA create what is "perceived" as an impact by airport operators and users. This proposed expansion is a real impact, not perceived and must be explained. AM-4
- VFR aircraft are allowed to enter the airspace at their own risk and are to "see and avoid". VFR traffic flying in the area and sharing the airspace with large, low-flying, high speed bombers and fighters creates an unsafe environment. SA-7
- There is no method to provide for safe separation of military and civilian aircraft due to limited or no radar and voice communications in the area. AM-3
- Seven of Montana's eight essential air service airports are located in eastern Montana. These communities receive this service because of their necessity to enter the national transportation system, to conduct business and receive medical services. The expansion will force the air carrier to divert and be re-routed around the proposed MOA causing increased expenses for fuel, aircraft time, maintenance and lost productivity. SO-7

I am confident that we can continue to work together to enjoy our open skies and share the existing airspace that Montana currently provides you. This allows us to maintain the most competent and qualified armed forces in the world. And because of our need to maintain their expertise along with the reasons stated above, you need to look at the expansion of Devils Lake, Tiger and Lake Andes MOAs not the Powder River MOA. Those expansions would better facilitate both the training of our armed forces and allow the essential general and commercial aviation industries to share our airspace without a negative economic impact. PN-2

Sincerely,

Jim Lynch, Director

Langley Air Force Base, VA 23865

Dear Ms. DeVine,

The South Dakota Wind Energy Association would like to comment on the new Power River Basin Flyover area.

We are concern that wills new flyover area will impede wind development in rural South Dakota. Since 1995 I have been working on installing anemometer to record wind speed in Western and Central South Dakota. Our measuring equipment is at 100 meter currently and the wind projects that we have been working on have a total height of excess 600 feet over on ridge top and buttes. SO-17

We would like to tell rest of your sorry and be at the negotiation table if you proceed.

Sincerely,

Steve Wegman
Executive Director,
South Dakota Wind Energy Assoication

SOUTH DAKOTA WIND ENERGY ASSOCIATION

Residents in Colorado and New Mexico Fear Impact of Military's Nighttime Sorties

By Stephanie Simon

The U.S. Air Force thinks the rough-hewn peaks of southwest Colorado and northern New Mexico make excellent surrogates for the treacherous mountain ranges in global hotspots such as Afghanistan. Some local residents beg to differ.

In a bid to provide Special Operations pilots more realistic simulations of wartime missions, the Air Force has proposed a vast new tactical training zone that stretches across 94,000 square miles of rugged terrain. Starting next year, commanders want to send C-130 transport planes and CV-22 Osprey tilt-rotor aircraft skimming across the region after dark at altitudes as low as 200 feet and speeds of up to 288 miles per hour. They envision three sorties a night.

The pilots would dart among the ridges and dip low over the rangeland, practicing the stealth needed for covert operations, said Col. Stephen Clark, wing commander at New Mexico's Cannon Air Force Base, which is pushing the proposal.

Pilots would be required to avoid cities in the zone, including Santa Fe and Taos in New Mexico and Aspen, Pueblo and Durango in Colorado. But communities and residents fighting the Air Force say that hundreds of low-altitude flights each year will spook cattle, scare children, rattle adobe buildings, create pollution and mar the tranquility they cherish.

"Our economy is based on people coming here for the beauty of the land, the solitude, the wild qualities," said Cliff Rain, who lives in Arroyo Hondo, N.M., north of Taos. He started an opposition group called Peaceful Skies.

At least four county commissions and two city councils have taken a stand against the proposal, and the Air Force has received 1,200 comments, most expressing concern about the impact on people and wildlife.

Satellite image of terrain in flight-training zone near Arroyo Hondo, N.M.

Military officers say the fears are overblown. The Air Force already sends pilots zipping across the region, at times as low as 200 feet above the ground, though current regulations have the effect of limiting night sorties to a half-dozen well-surveyed routes, Col. Clark said.

Under the new proposal, pilots would be allowed to map their own routes through the tactical training zone, increasing the challenge and realism of the training, Col. Clark said. It would also tend to disperse the noise and disruption across a broader area. He said he doesn't anticipate that any one village or ranch would experience the air craft overhead more than a couple times a month.

Col. Clark said the military has not measured noise levels of aircraft flyovers at 200 feet. For someone standing on the ground, aircraft at an altitude of 500 feet would create a sound exposure of 91 to 95 decibels, or "somewhere between a lawn mower and a chain saw," he said.

The Air Force has hired a consultant to assess potential environmental impacts, which will be the subject of public comment next spring, after which Special Operations commanders will decide whether to scrap, revise or implement the proposal.

Kathleen Dudley plans to throw herself into fighting the Air Force should commanders choose to move ahead. A writer in Mora, N.M., northeast of Santa Fe, Ms. Dudley said she and her husband were eating lunch on their deck recently when a military aircraft screamed overhead, flying so low "that we were looking into the eyeballs of a pilot bearing down on us."

"I was terrified," she said. "You don't hear or see them until they're upon you, and then it's like being in a war zone."

urges the military to minimize the

RE: Impact of proposed Powder River Training Complex on wind generation

Dear Ms. DeVine:

We have received inquiries at the Public Utilities Commission from landowners about the impact of the proposed Ellsworth PRTC on potential wind energy development in the project area. We wish to ensure we understand the effects of the proposed action on our constituents and their properties so we can accurately respond to questions.

Our inquiry should not in any sense be interpreted as expressing opposition to the project. The commission has the utmost respect for the service provided by Ellsworth and its personnel, often involving great personal sacrifice. We express pride and gratitude that our state is home to such a significant national defense institution. We also understand the need for Ellsworth to maintain training and readiness facilities that enable the base to fulfill its mission. GE-9

Based on our reading of the Draft Environmental Impact Statement, wind energy development would not be negatively affected by the PRTC expansion. For example, in Land Use under Proposed PRTC, Section 4.8.3.1 on p. 4-95, the DEIS states with respect to Alternative A, the preferred alternative:

> A concern noted by scoping participants was the potential incompatibility of low-level flight with land dedicated to wind farms due to the height and electromagnetic emissions of the wind turbines. Like other tall structures, existing and future structures must be officially charted with FAA and avoided by appropriate vertical and lateral distances. As a precaution for proposed night operations and other commercial and private flight, tall structures are required to have lights that warn of their presence. Overflights at altitudes would avoid the physical structure and electromagnetic emissions of wind turbines. The Proposed Action would not inhibit the development of future wind farms or other industrial land uses. (emphasis supplied).

3030

Similar language is repeated at several other places in the DEIS. Later in Section 4.9.3.1.4, Environmental Consequences, Energy Resource Development, the DEIS contains the following general policy statement:

> In 2007, the Department of Defense released a letter stating that the DoD would not oppose the development of wind farms or other sources of renewable energy that would not impact military readiness or training. The Air Force would coordinate with FAA and other regulatory agencies to evaluate wind farm proposals under the proposed airspace on a case-by-case basis.

These excerpts from the DEIS indicate the case-by-case evaluation in reference to the PRTC project has concluded curtailment of wind tower development is not necessary to accommodate the project, is not being requested and will not be a natural consequence of the project.

Please provide affirmation regarding our interpretation so we can share this with landowners who have contacted us and are investigating wind energy development potential in the PRTC area.

SO-17

Sincerely,

Dustin Johnson	Steve Kolbeck	Gary Hanson

RE: Powder River Training Complex, National Historic Preservation Act (NHPA) Section 106 Compliance.

Dear Linda,

Thank you for the EIS and the cover letter which lays out your plans for complying with Section 106. Our office thinks that this project may have an adverse effect on cultural resources in Montana. We would not be able to comment in detail on what properties may be affected, or what level they may be affected, until after a survey report is submitted. We recognize that not every section of land will be affected that was outlined in the maps submitted, so we need to define the undertaking to a degree that will allow a file search and survey to be conducted. CV-2

We would look forward to a meeting on this subject in the late fall or early winter of 2010. If the meeting cannot be held in Helena, Montana, we would request funding to attend such a meeting. Please keep us abreast of the planning on this undertaking as it develops.

If you have any questions or concerns about what I have written above, you can contact me at (406) 444-0388, or email at jwarhank@mt.gov.

Sincerely,

Josef J Warhank

SENT VIA FAX: (757) 764-1975

Dear Ms. Devine

Enclosed is a copy of the correspondence I received from my constituent, Mr. Wade Bergslien, Pilot for True Drilling Company of Casper, Wyoming concerning the Powder River Training Complex. I believe Mr. Bergslien was in attendance at the meeting in Gillette and that he made his concerns about the proposed project known at that time to your agency, the Federal Aviation Administration and Air Combat Command. I believe you will also find this information self-explanatory.

I would respectfully ask for your thorough review of Mr. Bergslien's comments and for you to provide me with as much information possible including, but not limited to, what measures are taken to ensure that his concerns will be given full and fair consideration throughout the analysis process. It may also be helpful for Mr. Bergslien to know precisely what options are available to him and his business and the proper procedures he must follow to remain adequately involved.

GE-12

You may reply to me at my Casper District Office, Post Office Box 44003, Casper, Wyoming 82602; or fax (307) 261-6597. Your assistance is greatly appreciated. My Field, Jackie King, may be reached at (307) 261-5585 with any questions or comments pertaining to Mr. Berglien's inquiry.

Sincerely,

Cynthia M. Lummis
Member of Congress

November 10, 2010

Congressman Cynthia Lummis
United States Congressman, Wyoming
1004 Longworth House Office Building
Washington D.C. 20515
202-225-2311

Dear Madam:

We the aviation department of the True Companies located in Casper, Wyoming would like to say we are in disagreement with the proposed Powder River Training Complex. This proposal is excessive in size as well as scope and will seriously impair the efficient use of our aircraft, and requires additional review before any consideration of implementation. GE-2

The needs of the United States Air Force and all of the benefits it forecasts for all components involved are noteworthy, yet they negatively impact flight operations such as ours and other corporate aircraft. The summary of the PRTC addresses how the Air Force will increase training capabilities and gain fuel and maintenance savings at the same time. However if implemented the civilian sector while be tasked with longer flight legs and increased fuel consumption which goes hand in hand with increased maintenance costs. SO-7

We are a long time participant in the energy industry of the Rocky Mountains. Corporate aircraft are an integral tool and facilitate companies such as ours and help us efficiently develop the natural resources with what we have been blessed. Bottom line is that streamlining our operations, thru the effective use of our aircraft, means reduced man-hours for those within and out of our companies who are dependant on our services.

As I have stated the proposed PRTC is immense and if granted is approximately 350 miles wide and will detrimentally affect all of our operations into and out of the proposed area within eastern Montana and western North Dakota. Aircraft dispatched from Casper or other airports that are set back from the MOA will be directed around the MOA when the airspace is "hot" (in use) and this will mean additional time and fuel and decrease our payloads. This could mean increasing fuel loads and or dropping passengers or using a larger aircraft than the trip should require. In times of obscured weather it could mean not even being able to reach your intended destination due to fuel requirements at arrival. An en-route tech stop is not a positive when time is of essence. SO-7

To compound the problem the proposed quarterly exercises have potential to increase usage as other units will want to travel to the new area for their requirements. This will only decrease the airspace availability time potentially impacting the civilian users even more, additionally this would find fault with the Air Forces forecasted fuel savings.

The Air Force and the FAA are stressing their willingness to coordinate to the civilian sector when these airspaces will be in use, yet those who fly professionally will admit that this coordination is weak at best. If this proposal comes to fruition, the Air Force and the FAA will be tasked with becoming stewards to an area which many companies and families find their livelihoods dependant upon. The Environmental Impact Statement or EIS does not approach or encompass our sector of the energy business, which is corporate aviation, to include charter aviation. It fails to consider that aircraft as far AM-1 SO-17

RECEIVED
NOV 15 2010
BY:

3033

away as Houston, Texas are dispatched daily to western North Dakota and eastern Montana. This portion of the energy business will as stressed as ours will. SO-17

In closure, it is clear that the inability to share this airspace will result in a less efficient cost structure for not only the energy industry but also all effected companies. These costs will ultimately be borne by the American citizen who is already stressed by the weakest economy in a generation. We request your assistance first in ensuring that the decision makers, the Air Force, the FAA and ATC, understand the burden placed on private industry; and second to facilitate a different solution for the military that benefits all parties. SO-22

Sincerely, Wade Bergslien

STATE OF SOUTH DAKOTA
M. MICHAEL ROUNDS, GOVERNOR

November 15, 2010

Linda Devine, Program Manager
ACC/A7PS
129 Andrews Street, Suite 337
Langley AFB, VA 23665-2701

Dear Linda,

The purpose of this letter is to convey my support for the Alternative "A" of Air Combat Command's Powder River Training Complex Environmental Impact Statement, dated August 2010.

I strongly believe in our nation's armed forces being well equipped and trained to the best of their ability to successfully complete combat operations. Toward that objective, I am fully supportive of providing them the airspace to sharpen their combat skills to be able to both protect themselves and defeat our nation's adversaries in the most effective and efficient manner.

Therefore, I am committed to the success of your initiative to provide the airspace required to successfully complete such training missions. My endorsement of Alternative "A" is further founded on the efforts Air Combat Command has made to accommodate those citizens affected by training flights and the knowledge that Ellsworth's leadership team will continue to fully consider special requests for such considerations.

GE-1

Thanking you in advance for this pioneering work in combat aviation training, please do not hesitate to contact me as we proceed with the realization of the best training complex our nation has developed in the past 50 years.

Sincerely,

M. Michael Rounds

Ms. Linda DeVine, HQ ACC/A7PS
29 Andrews St., Suite 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine:

North Dakota Farm Bureau members oppose the proposed U.S. Air Force expansion of the Powder River Training Complex. The Minot Air Force Base and the Ellsworth Air Force Base are both important strategies in our national defense. While we recognize the need for national security and proper training for our military, quadrupling the size of the area would have detrimental impacts to residents in southwest North Dakota. GE-2

Maj. Matthew Reese has said, "We're looking at expanding the Powder River Training Area to about four times its current size, over primarily unpopulated areas." We believe the residents in southwest North Dakota are just as important as other areas of the country and deserve consideration. EJ-2

The noise of the low-flying B-1 and B-52 bombers will spook beef cattle and sheep, causing them to run. The animals will not only lose weight, but can injury themselves by stepping in a prairie dog hole or other obstacle. In this part of the country, ranchers make their living raising cattle and sheep. Agriculture is the number one industry in North Dakota and the southwest area of our state is a vital component of our industry. These people depend on livestock for their livelihood. BI-4 SO-13

The noise will similarly impact wildlife. At the same time, the flares set off by the aircraft could start fires in the area. BI-4 SA-5

With 27,000 members, North Dakota Farm Bureau is an independent, non-government, voluntary organization united for the purpose of analyzing issues and formulating action on agricultural concerns.

We hope the U.S. Air Force will reassess its expansion of the Powder River Training Complex. Thank you for your consideration of this matter.

Sincerely,

Eric Aasmundstad

Linda DeVine, Program Manager
ACC/A7PS
129 Andrews St. Suite 337
Langley AFB, VA 23665-2701

Dear Ms. DeVine,

My name is Matthew Remynse; I am the manager of the Dickinson Theodore Roosevelt Regional Airport (Dickinson Airport) in Southwest North Dakota. The Dickinson Airport is governed by the Dickinson Municipal Airport Authority (DMAA) a five member board appointed by the City of Dickinson. Aviation has a vital part in the economic development of Southwest ND and the DMAA has the responsibility of assuring that aviation in southwest ND continues to grow, remains strong, is convenient, and remains readily available for our citizens. I have been following the development of the MOA expansion and believe that the expansion will adversely impact aviation activities in southwest North Dakota. I'm writing to inform you of the concerns I have with the expansion of the Powder River MOA.

I'd first like to describe the current economic situation in southwest, ND and how the Dickinson Airport plays a part. Southwest ND is seeing unprecedented growth and is in the mists of a growing economy that is being pushed by the oil development of the Bakken and Three Forks Oil deposits. Aviation has played a large role in the growth by allowing companies from across the nation to fly into the Dickinson Airport utilizing both commercial and general aviation. In a 2004 study conducted by the North Dakota Aeronautic Commission, it was determined that the Dickinson Airport has a $30 million impact on Southwest ND and creates 305 direct jobs. The study also determined that each commercial passenger that flies into Dickinson spends approximately $710 per trip. In 2004 the airport had just over 5,000 commercial boardings for the year, by taking 5,000 passengers and multiplying it by an average of $710 that is an impact of $3.5 million. If we move ahead six years to 2010 the airport has already boarded 8,200 passengers and will be over 10,000 boardings for the year. Based on the 2004 number of $710 that is impact of $7.1 million to southwest ND. This impact includes jobs of airline personnel, airport personnel, and personnel in Southwest ND who support the traffic such restaurants, motels, rental cars, and service stations. This impact allows southwest ND to continue to grow its economy while the rest of the country is in a downturn.

I feel that the expansion of MOA could affect both General Aviation and Commercial Aviation to and from the Dickinson Airport during a time in which southwest ND is seeing such unprecedented growth.] SO-22

Commercial aviation has played a large role in the growth of Dickinson. Great Lakes Airlines operates three round trips daily between Dickinson and Denver. The airline has been able to keep up with the demand of travelers by adding additional flights and working hard to assure that Dickinson passengers

3036

get to Denver at time where they can connect with other flights. The hard work of the airline has not gone unnoticed by the businesses using the airline either. The airports annual boardings have continued to rise since the oil activity started in late 2006. In 2006 the airport only had two round trips that were shared with another community and airport's annual boardings totaled 5,400 passengers. In 2009 there were three round trips shared with another community and the airport's annual boardings were 8,937. Today the airport has three round trips daily and only one of those round trips is shared. The airport's boarding s as of October 31st were 8,217. By the end of 2010 the airport is going to have over 10,000 boardings.

All of this success is due to the fact that Great Lakes Airline is able to offer convenient reliable air service to southwest ND. If the MOA were to be expanded the airline would be affected. The times proposed for PR-4 coincide with the two busiest trips a day. This may cause our commercial flights to be delayed or forced to divert around the MOA because the MOA is "hot". Both of these scenarios will cause the airline to incur additional costs and inefficiencies. This translates into southwest ND no longer having the convenient affordable air service it has come to expect. If passengers do not have convenient affordable air service out of Dickinson they will choose other airports that are not affected by the MOA. This is a direct loss of passengers for the airport.

There are many possible effects that the airport could receive due the the loss of passengers. The biggest effect is the loss of air service. If the airport starts losing passenger the airline will no doubt reduce the air service into the Dickinson Airport ultimately reducing the available seats to southwest ND passengers and greatly reducing the redundancy and reliability of our flights. If the airport were to lose passengers it will fall into a lower category for funding. As the airport closes out 2010 it will be above 10,000 boardings for the year. Every year the airport is above 10,000 boardings a year it is able to receive $1 million in funding from the FAA for capital improvements of the airport. If the airport loses this status the airport will lose $850,000 a year in funding. This will slow the airport growth and will not be able to meet the infrastructure demands of the growing region. Every passenger lost to another community is $710 that is no longer being spent in southwest ND. If the airport were trend back to 2006 numbers that would be an annual loss of $4 million dollars to southwest ND's economy.

SO-22

The Dickinson Airport has seen general aviation grow just as we have seen commercial aviation grow. This is evidenced by the increase in fuel and hangar sales at the airport, and the amount of entries in the airport's GA operations log. The airport's operation tracks all the general aviation traffic. General Aviation plays a role in the economic sustainability of the growing region as well. General aviation at the Dickinson Airport provides charter service, freight service, air medical and agricultural service. The airport's FBO, Western Edge Aviation provides charter service, flight instruction, aircraft rental, aircraft maintenance, courtesy car and a full pilot's lounge. Above all, these services allow for any person or business from across the world to fly right into our economy and I feel that the development of the MOA could disrupt the general aviation traffic coming into the Dickinson Airport.

SO-8

The proposed MOA essentially blocks off the Dickinson Airport from any traffic coming for the south, southwest and southeast. A majority of the traffic the airport receives comes from these directions due the geographical location of the airport. The PR -3 and PR-4 MOA are active during the morning, which is a busy time for general aviation traffic and this has the potential to reduce the amount of traffic that utilize the airport. Any time an aircraft chooses not to utilize the airport it is a direct loss of income for the FBO and airport. An aircraft can take between 30-100 gallons of fuel when it stops at the airport. If an aircraft decides to use another airport it could cost the airport and FBO anywhere from $60-$200 per aircraft. It is difficult to gauge the amount of traffic that could be lost, but suppose the airport lost 10%

SO-22

3036

of its GA traffic or 240 aircraft. If the airport were to lose 240 aircraft to another airport the Dickinson airport could stand to lose $48,000 in revenue. How would an airport compensate for the lost revenue? There are two options, reduce services, or increase fees. Either option the airport chooses will ultimately cause the airport to lose more customers. The expansion of the MOA is an economic hardship to the FBO and southwest ND. The reduction in traffic could lead to a loss of jobs, and create further economic hardship to the region.

SO-22

SO-10

The above paragraphs speak toward general aviation as a whole, but the MOA expansion will affect each aspect of general aviation differently. Charter service coming into and out the Dickinson Airport will be affected any time there are IFR conditions. Since IFR is prohibited when the MOA is "hot" it will provide unpredictability into the charter operation causing charter companies to experience delays and cancellations. Medical flights that serve the small general aviation airports underneath the MOA may be delayed or canceled creating a huge burden to the hospitals that rely heavily on doctors from larger towns. Businesses utilizing private aircraft will be negatively impacted. The potential for rerouting around the MOA will cause additional hardships to the company as a result of additional fuel and time.

SO-5

I understand the need for the military to train it personnel, but the expansion of the MOA will negatively impact the airport and the economy in southwest ND. I thank you for your time and strongly urge the USAF to take the No-Action Alternative. If this airspace is chartered it would be detrimental to aviation in southwest ND. Again I thank you for your time and if you should have any questions please do not hesitate to contact me at 701-483-1062

GE-2

Sincerely,

Matthew Remynse
Airport Manager

FAA Airspace Study 10-AGL-6NR

United Air Lines, Inc. and Continental Airlines, Inc. are wholly owned subsidiaries of United Continental Holdings, Inc. Together with United Express, Continental Express and Continental Connection, these airlines operate a total of approximately 5,800 flights a day to 371 airports on six continents from their hubs in Chicago, Cleveland, Denver, Guam, Houston, Los Angeles, New York/Newark Liberty, San Francisco, Tokyo and Washington, D.C. A significant number of our flights cross the proposed Powder River Training Complex (PRTC) every day providing vital scheduled air service to and from many domestic and international city pairs.

We hereby submit the following comments in response to the Powder River Training Complex Draft Environmental Impact Statement (EIS).

Both Continental Airlines and United Airlines have long shown extraordinary levels of support for the men and women of our armed forces and are truly grateful for their service and sacrifice. In the modern world, more than ever, we recognize the need for them to train as they fight.

As proposed, the Powder River Training Complex (PRTC) Military Operations Areas (MOAs) will be comprised of an unprecedented amount of airspace from parts of Montana, Wyoming, North Dakota and South Dakota. Though the PRTC covers a somewhat sparsely populated part of the United States, numerous jet routes and efficient trajectories pass through this airspace. For example, on Tuesday, August 17th 2010, between the hours of 1400Z and 0200Z between FL 330 and FL390, three hundred ninety five flights passed through the proposal area. The majority of these flights were scheduled Part 121 (air carrier) operations. But in total, on that day, from the surface to FL 450, 776 flights of various kinds transited or used airspace within the proposal area. If the PRTC is activated as described in the EIS on a daily basis, most of these flights will have to find another way to get to their destinations. AM-21

About 110 United and Continental flights transit the proposed PRTC to or from our hubs in SFO, LAX, DEN ORD, IAH, IAD, EWR and CLE daily. When the area is in use each of these flights will have to fly an average additional 50 flight miles to avoid the area. The extra flight miles at cruise will require an additional 55,000 pounds of fuel each day. SO-7

3037

At current fuel prices with the proposed times of use this represents $6.000.000 in fuel costs and 14.3 million pounds of extra fuel burned each year to our airline. SO-7

In the EIS, the United States Air Force (USAF) describes in detail proposed quarterly Large Force Exercises (LFEs) designed to last one to three days each. We have no objection to these limited duration exercises and consider this to be high value use of the airspace. GE-14

In our review of the proposal, however we do not see justification for activation of the MOA /ATCAAs beyond the LFEs. Blocking the area Monday through Thursday from 7:30am to 12:00pm and then from 6:00pm to 11:30pm with an additional block from 7:30am to 12:00pm on Friday will require hundreds of flights a day to be delayed or rerouted around the area. The excess fuel burn associated with these flights' altered trajectories and the associated increased emissions do not appear to be addressed in the EIS. SO-22 AQ-4

United and Continental Airlines had hoped to be able to address our concerns regarding the "Proposed Action Alternative A" with the USAF directly and at the national (NAS) level. Such an opportunity to have a frank and open discussion with the USAF and other stakeholders regarding their needs might have lead to other potential alternatives to manage the airspace more safely and efficiently. However, the USAF has been unwilling to meet to discuss the proposal beyond the LFEs and that has left us few alternatives. GE-11

United Airlines and Continental Airlines feel that this proposal has not had sufficient review at the NAS (national) level. The LFE use of the airspace appears to be manageable in terms of its impact on other NAS users and not significantly different from other similar exercises that are conducted periodically in other parts of the NAS. The non-LFE portion of the proposal impacts a vast volume of airspace on a daily basis and will put an undue burden on the environment and hundreds of civil aviation and non-participating DOD flights every day. United Airlines and Continental Airlines object to the non-LFE portion of the proposal based on its adverse impacts on the efficient use of the navigable airspace. GE-14

Sincerely,

Timothy L. Stull

Public Scoping Meeting for the Proposed Powder River Training Complex

Thank you for your input! **DATE:** 9-16-10

PLEASE PRINT

As President of the Sundown Ranches HOA. We welcome the Training Complex. We want to have the best fighting force on the planet. And if the expanded/new complex helps. Then we are all for it.

As an American I like seeing our war planes @ work. In our remote area, we don't get to see it much.

GE-1

Re: Powder River Training Area Expansion - Comments

To Whom It May Concern:

Background:
The South Dakota Stockgrowers Association (SDSGA) is an organization of 1,300 cattle and sheep producers committed to representing the independent livestock producers in regards to the sustainability of their livelihoods.

SDSGA appreciates the opportunity to provide meaningful input regarding the expansion of the Powder River Training Complex.

Comments:

South Dakota livestock producers understand and support the need for military training for the security and benefit of our country.

We also understand and support the need for livestock producers whose livlihoods feed and promote the health and well being of the citizens of our country; whose inherent job it is to protect the land that is their sustaining factor. It is with these facts in mind that we oppose the expansion of the Powder River Training Complex as it is defined today. GE-2

1) Opposition to military aircraft flying at 500 feet altitude. PN-4
   A.) At present there are over 300 private planes registered to people in this area. Many of These small planes belong to ranchers who use them in their day to day work. Some belong to people whose job is predator control. Some belong to people who use them for transportation to and from work in small towns. Crop sprayers who work seasonally according to certain crops, and only in weather conditions that prevent drift of spray, do not have the luxury of working according to a set schedule. SO-15 SO-2

426 St Joseph Street, Rapid City, SD 57701 ■ www.southdakotastockgrowers.com

3039

We have been told that Ellsworth must notify the Federal Aviation Administration two hours before a mission and that the information can be obtained by phone or website. We realize this is for the purpose of being a "good neighbor", and we certainly hope to be the same. However, many of these folks would be in the air before any given time; are not radio equipped, and often are not in close proximity to a computer or phone. AM-12

The increased number of military aircraft in the area flying at that altitude is a danger to farmers, ranchers and business people who have the right and the need to use their small aircraft. SA-7

2) Opposition to chaff and flares.

A.) We understand there is a "small" chance of a dropped flare igniting a fire. There is also a "small" chance of lightening striking the ground and causing a fire, but it happens. According to Ellsworth Air Force personnel "there would be roughly half a dozen flights a day at Powder River". That means there would be roughly half a dozen chances a day for the "possibility" of a fire. This would be extremely dangerous in oil and/or gas fields such as those in Harding County and parts of North Dakota, Montana and Wyoming. SA-5

Although we were told by Air Force personnel that there has never been a fire from a flare, we understand a 17,000 acre fire near Atlantic City, New Jersey in 2007 was the result of a flare accidentally dropped from an Air Force aircraft.

3) We have found no evidence of an Environmental Impact Study on the effects of noise, chaff and flares over the habitat area of the Greater Sage Grouse. In March 2010, prior to the Powder River Training scoping meetings, the U.S. Fish and Wildlife Service listed this Sage Grouse as "Warranted but Precluded" under the Endangered Species Act. BI-3

4) We appreciate the fact that the training area is directed away from major airports and commercial air-traffic lanes. However, several times we have heard Air Force personnel refer to the training area as a "sparsely populated" area. The reason it is sparsely populated is due to the fact that you cannot produce food to feed our nation in an urban area. It would seem as though the Air Force has established a certain distinction between urban and rural populations and has chosen an area of lesser importance instead of looking at *unpopulated* areas. LU-1

South Dakota Stockgrowers appreciate the opportunity to comment on this extremely important subject. We have the greatest respect for the United States Air Force and are fully aware of the need for their continued training and education. We hope those of you who make these decisions will also realize the importance of this country's farmers and ranchers and would have the same respect for our needs and will take our concerns into consideration as you make the final plans.

Most Sincerely,

Margaret Nachtigall, Executive Director
South Dakota Stockgrowers Association

RE: Proposed Powder River Training Complex

Dear Ms. DeVine

Thank you for allowing us to comment on the Proposed Powder River Training Complex EIS. We are a 2300 megawatt Coal Fired Steam Electric Station located in Colstrip on Highway 39 thirty miles south of Forsyth. We are located in the proposed PR-1 High Military Operation Action Area and just north of the PR-1B high Military Operation Action area that covers the Northern Cheyenne Indian Reservation.

In Alternative A of the Proposed EIS, Large Force Exercises will be conducted 1-3 days per quarter or 10 days annually. In light of the Homeland Security Act and the safety and security of our employees here at the Colstrip Steam Electric Station, we are requesting a notification process be added to the Proposed Action and Alternative Action Items in the Environmental Impact Statement (EIS).

A notification of when LFE's (Large Force Exercises) will occur in our area will allow our manager and our security department to have this information available in case questions arise from our employees about activities in the air space above our power plants. It would also be a good idea to contact the police and sheriffs offices in the towns of the affected areas during LFE's. In our situation, we are thinking an email to our security department and to our plant manager would be sufficient notice. The timing should be 2-3 days notice prior to the start of the LFE's

AM-12

Thank you again for allowing us to comment on your Powder River Training Complex EIS.

Sincerely,

William L Neumiller

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews St., Suite 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine:

The North Dakota Stockmen's Association (NDSA) is an 81-year-old trade organization that represents nearly 3,000 North Dakota beef cattle producers. Our association is a strong supporter of the U.S. military and credits the freedoms we enjoy and the ability we have to live out our American dream, raising cattle and providing a safe, wholesome product for consumers, to the hard work and sacrifices of past and present soldiers.

Our members understand the importance of training and equipping our forces so they are able to protect our nation and defend our way of life. Yet, the massive proposed expansion of and the low-level flight involved with the Powder River Training Area could negatively impact livestock operations in the region, and we urge you to instead consider other alternatives to improve military readiness and expertise.

Our members identified the following major concerns with the Powder River Training Complex proposal in a policy resolution at our recent convention: possible interference with producers checking livestock with small aircrafts at similar altitudes, the potential of fires when flares are released and the startling of livestock due to noise. SA-7

We understand that flares are only being planned for higher-elevation flights, which should allow for burnout before they near the surface, but we are concerned that if those thresholds are not followed and flares are accidentally deployed, serious damage could result, like in the May 2007 accident in the Warren Grove area in New Jersey. The Environmental Impact Statement indicates that the use of flares would be suspended when the fire danger reaches the "extreme" category. The proposed expansion area in North Dakota, however, is big grasslands country, often with lots of "fuel" for prairie fires. Consequently, we believe that a much lower fire danger category would have been a more appropriate trigger. SA-5

The Environmental Impact Statement points out that "increases in the Day-Night Average Sound Level and individual noise events from an aircraft overflight would be noticed and could be perceived as a significant impact by residents under the airspace." Livestock producers agree and find the low-level flights, such as the B-1 missions proposed, where adjusted sound exposure levels could hit as high as 133 dB, a particular concern. The uncertainty of low-level overflight and the inability to anticipate when such an overflight could occur would contribute to the startle effect of animals. This, of course, could result in livestock fleeing, breaking loose and/or causing infrastructure damage and/or injury or death to themselves or humans tending to their care. BI-4

We appreciate the inclusion of the "temporary avoidance areas" in the plan; however, must point out several limitations with this concept. The Environmental Impact Statement identifies branding and weaning as potential activities, which could be indicated as times to avoid upon arrangements between air space managers and livestock producers. Those activities would certainly be ones to avoid, but it is important for planners to understand that these are not the only times when livestock would be gathered, penned and have an increased tendency to spook. For instance, backgrounding and finishing are growing enterprises in this region, and complement the already prevalent cow-calf production that occurs there. Considering the functions of these cattle enterprises, it is not unusual for some cattle to be corralled for three to six or even more months out of the year, so the temporary avoidance concept may not be workable for military officials. Another question that arises is how livestock producers would "register" these avoidance areas, and how much notice would have to be given so trainees could adjust their routes? Unfortunately, Mother Nature "unplans" many work plans on livestock operations, and, consequently, producers need the flexibility to respond to whatever the conditions allow them to do without the delay of any sort of waiting or processing period. SO-13

The Environmental Impact Statement indicates a desire to minimize the annoyance that the expanded training area would cause for residents. Have planners considered putting applicable farmsteads on a permanent avoidance area list, and, if so, would that be a practical option? LU-2

11/01/2010 00:14 7014457309 EL PAGE 01

3041

We would also appreciate more information regarding the proposed threat emitter sites. The Environmental Impact Statement alludes to some of the details, but does not include many specifics, like the number of sites being proposed. Are plans to lease the acreage for all sites, or would some property be acquired as well?] CM-2

In summary, the North Dakota Stockmen's Association supports U.S. troops, the defenders of our democracy; however, livestock producers have significant concerns about the proposed Powder River Training Complex expansion project and, therefore, encourage the utilization of current or alternative options that would be less intrusive.

We appreciate this opportunity to comment and ask questions about the proposed plan.

Sincerely,

Jason Schmidt

11-9-10

I am the pilot for the North Dakota Game and Fish Department and am responding to the proposed Powder River Training Complex (PRTC). The NDGF has two aircraft and eight vender aircraft which are used extensively in the area proposed as well as in the current Powder River MOA and ATCAA.

Being the NDGF Aviation Department and an avid general aviation enthusiast, I strongly oppose any increase in the size of the existing Powder River MOA and ATCAA. I recommend the "No Action Alternative" based on the following reasons:

GE-2

The department can have surveys, surveillance missions and radio telemetry work going on nearly every day of the week using the two department aircraft and vender aircraft. A great percentage of this is done in the south western part of the state as well as telemetry work done in South Dakota and Montana as far south as the Wyoming border. Reducing the regularity of these flights due to a "hot MOA" combined with weather considerations would cause time constrictions that would be unworkable. It is understood that this expanded area would not be a "Restricted Air Space" and that civil operations would be allowed, but to rely on see and avoid tactics with 400 mph to 500 mph closing speeds is unrealistic.

SA-8

Sincerely,
Jeff Faught

Subject: Comments on the Powder River Environmental Impact Study

Executive Summary:
The Powder River Military Operations Area (MOA) is presently located primarily in Montana. Additional airspace is being requested by the 7th Bomb Wing from Ellsworth Air Force Base, South Dakota. The 5th Bomb Wing from Minot Air Force Base, North Dakota would be an additional user. Air warfare has changed, and additional air space is being requested to provide realistic training for these and others. The requested airspace would expand to approximately four times the original MOA, and affect North Dakota from Bismarck south and west to the borders, and from 500 feet above the ground to 60,000 feet. Options were given, with option A being what was requested by the Air Force, option B expanding only into North Dakota, option C expanding only into Montana, and a no-action alternative.

The North Dakota Aeronautics Commission attended each Environmental Impact public hearing and noted citizen's concerns at each hearing. In addition, the commission has received numerous additional inputs as the proposed airspace debate gained publicity. The North Dakota Aeronautics Commission recommends option C, since it would satisfy all of the military's needs while minimizing the negative impacts to our state. Option C, as was stated by the Air Force at these hearings, would be the preferred option because this plan would allow for continued economic prosperity and quality of life while allowing the military to satisfy all of its training needs, including mountainous terrain training in the western portion of the proposed MOA.

3043

Factors leading to this decision:
The following topics reflect the concerns of North Dakota's citizens which would need to be addressed if the Powder River 4 MOA sector (the eastern portion) was to become active:

Airlines

- The city of Dickinson has benefited greatly from the Department of Transportation's Essential Air Service program, helping small cities to connect with the rest of the country. The goal of the program is to build an airline infrastructure to become independent of funding in the future. In recent years, the oil development has helped to increase loads toward 10,000 passengers, a significant threshold for FAA funding increases from $150,000 to $1 million annually. Ten days of cancelled flights due to military operations could make the difference in making this threshold.

SO-5

Corporate/Charter

- FAR Part 135 flight operations and company operations specifications requirements often dictate that flights must be conducted on instrument flight plans (IFR). Flights would not be permitted through any airspace that is active or scheduled, severely limiting these companies. This uncertainty of available airspace would make it prudent to change a company's destination. These communities count on the oil industry, hunting and tourism for a large part of their livelihood. If the destination changes, the community suffers.

SO-9

Aerial Applicators

- 127,060 acres were sprayed in southwest North Dakota associated with the proposed MOA in the previous year. The Federal Aviation Regulation 91.119 requires aerial applicators to fly at least 500 feet above any person or structure when transiting between fields and their airport. This puts the sprayers at the same critical altitude where the crews of large, high-speed military aircraft are concentrating on terrain following training and tactical maneuvers.

SA-15

Private Pilots

- During a period of declining pilot numbers, this airspace would limit the state's ability to produce new pilots. Concerns of special use airspace would keep any prudent student from flying where their skills at see-and-avoid would be critically tested. The proposed military airspace is below radar contact, and visual is the only means of separation at 600 knots closing speeds.

SO-26

2

2/4 11-12-2010 16 43 11 7013289656

3043

- The sector gaps are intended to allow transit on VOR navigation, or Victor airways. These airways are no longer the normal means of navigation, but a hold-over from before the advent of GPS. Pilots generally fly direct to save time and fuel, and the FAA's NexGen plan reinforces this. The airways can be used to avoid the MOA, but at an increased cost to the flying public. SO-7

FBOs

- Fixed-base operators are the anchor points for general aviation. They survive through the combined income of fuel sales, flight training, aircraft rentals, and hangar fees. Civil flight training will be curtailed without adequate training areas for student pilots. Flight paths for transient aircraft will change to avoid potential airspace restrictions, losing fuel and other sales at the FBOs. An FBO in Bismarck anticipates a loss of $300,000 in revenue annually. SO-5 SO-7

Local Communities

- Cattle herdsman at the hearings passionately objected to the low altitude aspects of the proposal. Many grew up in the same area when B-52s flew low altitude routes, and saw the devastation of startled cattle, breaking necks and limbs against stockade fencing. Even the most positive of the ranchers asked, "Please- can you just give me a number to call a real person when my year's income is killed in a stampede?" SO-13 GE-8
- A Real estate agent knows what makes the property valuable – they value the peace and serenity that gave people a reason to live there. Many people noted the "startle" effect on a fly-over at 500 feet for unsuspecting people. SO-1

Weather Modification

- Crops and homes are kept safe by aerial hail suppression, which requires quick response, accurate radar imagery, and precise cloud seeding. By design, the chaff which will be deployed ruins the weather radar returns, putting a halt to their business. Cloud seeding often requires close proximity to the clouds or penetration, dictating the need for an instrument (IFR) clearance. IFR is not permitted in the active MOA, halting cloud-seeding operations and putting homes and agriculture at risk for damage from the weather. SO-28

Clinics

- Approximately 80 medical flights each month originate in Bismarck. Doctors and their staff would not accept the loss of revenue associated with driving between their homes and outlying clinics. Flights requiring an IFR clearance could not be conducted into an active or scheduled MOA, and the proposed time of MOA activity (07:30- 12:00) corresponds with the times needed to deliver these medical teams to rural clinics. Cancellations or delays would jeopardize the clinics in the rural areas including the towns of Hettinger and Bowman. SO-5

3

3/4 16:43:26 11-12-2010 7013289656

3043

Air ambulance operations

- The EIS implies that most air ambulance flights are below 10,000'. The majority of air ambulances are now pressurized turboprops operating above these altitudes. Rural communities have been assured that all military operations will cease in the event of an air ambulance operation, but the FAA and Air Force should be aware that the aircraft may be operating between Flight Level 180 and 250.

SA-18

Tribal Concerns

- Separate and private hearings were conducted at the tribal reservations. Concerns were stated, but were not submitted to the aeronautics commission.

NA-2

Aerial Wildlife surveys and predator control

- This topic is important to North Dakota, but will be detailed through the response from the North Dakota Game and Fish Department.

SO-15

Conclusion

Option C, which excludes the area in western North Dakota, would provide the additional airspace and geography needed for the additional training required by the Air Force without deteriorating North Dakota's economic, environmental, and quality of life elements. The public input was emotional and well documented across the state. The reasons against the Powder River 4 MOA varied between the different communities of North Dakota, but the solutions to each community's concerns could be solved by selecting Option C of the Environmental Impact Proposal. Regardless of the final decision, the following modifications would minimize the negative effects on North Dakota:

DO-5

1. Attempt to shrink the North Dakota area as much as possible ... exclude areas around cities and airports.

AM-5

2. Raise the minimum altitude as much as possible. A floor of 10,000 within the eastern sector would allow for most business to continue and limit the hazards caused by high-speed military aircraft and their operations.

DO-4

4

4/4 11-12-2010 16:44:29 7013289656

Written Comment Sheet
Public Hearing for the Proposed Powder River Training Complex

Thank you for your input! **DATE:** 4-21-10

PLEASE PRINT

Due to the economic activity related to natural resource development in our community, I have concerns with the flight space proposed interfering with our airport expansion and any expansion of constructed or proposed wind farms in our area. While I believe training for the Air Force is essential necessary, I would recommend flights that near Bannon County to be at higher altitudes near 14,000 ft. From my daily duties I regularly see to try to decrease impacts on community quality of life. These low and other low flights I believe will be a public nuisance or impact our daily living. My greatest concern however involves the chaff. AM-5 SO-17 LV-2

and its effect on our local Bamman Radar. While this radar is most utilized during the summer months by the weather modification program, it is in the process of being up and running year round. This radar is vital to our area due to the lack of radar coverage from Bismarck, Rapid City & Billings. Because these three radars are a good distance away, none of them accurately cover Bamman County. Again, we need radar coverage & without the Bamman Radar - we have none. The economic impact from severe weather on our agriculture community is huge. Our farmers & ranchers need to have radar coverage to see approaching storms and the increased protection from the weather modification program. This program's hail suppression activities are proven successful and protect our agriculture community from great loss, not to mention the loss to property owners from hail damage, flooding, heavy runoff. Near our radar is very important and appreciated. SA-16

As a community we support our Armed Forces and we appreciate the opportunity to have public input in this project. NP-3

Thank you for your consideration of our concerns & compromise on these important issues.

MEMO

DATE: September 20, 2010
TO: The United States Air Force
FROM: Holly Waddell, Chairman, Dakota Rural Action Holly Waddell
SUBJECT: Expansion of the Powder River Training Complex

Thank you for your time in considering the public comments presented at the various hearings being held.] NP-3

On behalf of Dakota Rural Action (DRA), I wish to present this copy of DRA's policy in regards to the proposed expansion of the Powder River Training Complex. Our membership adopted this resolution in 2008 and members still have grave concerns about this proposal. DRA is a family agriculture and conservation group organized to help South Dakotans preserve the family farm and ranch, the environment, and our unique way of life. Offices are located at 910 Fourth Street, Ste. A, in Brookings, South Dakota; phone 605-697-5204.

OPPOSITION TO EXPANSION OF THE POWDER RIVER TRAINING COMPLEX (adopted 2008)

WHEREAS, The United States Air Force and Ellsworth Air Force Base is proposing an expansion to its Powder River Training Complex which would:

1. Expand and enhance the existing Powder River Complex (PRC), which currently has both airspace and ground-based Air Force training assets in South Dakota, Wyoming, Montana, and North Dakota
2. Add new airspace with a floor of 500 feet and eliminate some existing airspace
3. Support additional ground-based simulated threat emitters under the Military Operations Areas (MOAs)
4. Authorize use of defensive chaff and flares throughout the special use airspace
5. Permit supersonic flight above 10,000 feet throughout the special use airspace
6. Support large force (over 20 aircraft) exercises (Federal Register:
May 29, 2008 Volume 73, Number 104), and

WHEREAS, the National Environmental Policy Act (NEPA) of 1969, as amended (42 U.S.C. 4321, et seq.) requires the Federal Government to coordinate with counties which have a Natural Resource Plan; and

WHEREAS, Jet plane take-offs produce 120 decibels, and noise levels greater than 85 decibels are hazardous to hearing and regular exposure of more than one minute at 110 decibels or louder can cause permanent hearing loss; and] NO-5

WHEREAS, There are no provisions for airborne access to any municipal or private airstrips except Rapid City Regional severely limiting private air travel, crop dusters, ambulance aircraft ability to travel with no provision for reimbursement of fuel or time consumption; and] SO-7

WHEREAS, Chaff is composed of aluminum–coated glass fibers that reflect radar being released in packets of 0.5 to 100 million fibers, which is determined to be necessary by the Department of Defense, but is known to affect human health, public safety by interfering with air traffic control radar and weather radar observations, electrical equipment, and impacts to wildlife and food supplies in an agricultural area are unknown; and] SA-14] SA-16

WHEREAS, 'Flares' burn at 2000 degrees and pose a serious fire risk if they are ejected as proposed at less than 1500 feet over an area that depends on voluntary fire departments and 'Duds' (flares which failed to ignite), that fall to the ground can endanger people or animals as they contain magnesium and lead; and] SA-5

WHEREAS, official Air Force policy precludes wind energy development due to radar interference; now] SO-17

THEREFORE BE IT RESOLVED, that Dakota Rural Action calls for full coordination between the US Air Force, Ellsworth Air Force Base and the impacted local governments and agencies to ensure minimal impact of the expanded airspace to human and animal health, the environment and natural resources, and use of local infrastructure necessary for maintaining a rural quality of life; and] NP-10] LU-1

BE IT FURTHER RESOLVED that any airspace used by the Air Force is rented from the landowner, with annual payments (not perpetual easements) to compensate for the use of the land including, but not limited to impacts to agriculture and wind energy production potential.] SO-1] SO-17

3049

Written comments
Proposed Powder River Training Complex

Continuing economic development efforts and retaining quality of life in Grant County, North Dakota, is extremely important to the Grant County Job Development Authority (JDA) and all of Grant County. Consequently, the Grant County JDA requests the following concerns be addressed in regards to the proposed Powder River Training Complex:

1) With respect to Grant County and North Dakota, would the proposed airspace expansion hinder the day-to day operation of the existing communications towers (i.e. cell, radio, microwave, etc.) which are within the confines of the proposed airspace expansion?

2) Grant County is the potential site for wind energy development; the county currently has developers considering the construction of wind farms in the county. One developer is in the queue with the Federal Energy Regulatory Commission. With respect to Grant County and North Dakota, would the proposed airspace expansion affect the development of wind tower sites within the confines of the proposed airspace expansion?

SO-17

3) Would aircraft flying in the vicinity of wind turbine farms negatively impact the mechanical operation and/or electrical generating capacity of these machines?

SA-24

4) What is the approximate number of flights (low and high estimates) we can expect to occur in the proposed expansion on a daily, weekly and monthly basis?

AM-27

5) Grant County depends upon regional air ambulance and helicopter medical evacuation (MEDEVAC) capability to transport patients who are in danger of losing life, limb or eyesight. Will the USAF give these flights priority over its scheduled military training?

SA-19

6) With respect to Grant County and North Dakota, will the infrastructure exist (assigned civilian compatible frequencies, repeaters, etc.) for air ambulance and MEDEVAC operators on lifesaving missions to be able to directly communicate their need for airspace with the authority (FAA, military controllers, etc.) in charge of this airspace?

AM-1

Respectfully submitted,

Luann Dart, director
Grant County JDA

Alaska Airlines 3050

November 5, 2010

Ms. Linda DeVine
HQ ACCC/A7PP
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine:

Alaska Airlines (ASA) has reviewed the Draft Environmental Impact Statement for the Proposed Powder River Training Complex (PRTC). We appreciate the opportunity to provide our comments on the impacts this proposal will have on civil aviation.

The proposed PRTC greatly expands MOAs and ATCAAs over North Dakota, South Dakota, Wyoming and Montana. The proposed expansion controls the airspace from the surface to FL600 resulting in significant negative impacts to commercial aviation. It will routinely cause re-routes that increase track miles, increase fuel burn and emissions, and reduce operational reliability. Additionally, it will degrade the safety of our flights because this proposal eliminates severe weather avoidance route options.

Routes
Alaska Airlines' primary and alternate weather routes go through the proposed PRTC. Twenty-five flights per day would be directly impacted by the ATCAA during the proposed hours of operation. Per the DEIS, the PRTC could be scheduled "other times by NOTAM", permitting military access to the MOA 24 hours per day. In a 24 hour period, up to 38 Alaska Airlines' flights could be impacted if the ATCAA is activated above FL260.

SO-8

Fuel Burn/Emissions
Changing our primary route around the proposed PRTC between SEA and DCA would add 36 miles per flight (or 700 lbs of fuel). Just this one re-route would burn 153,000 additional gallons of fuel per year. The increased fuel burn adds up quickly when considering all of ASA's impacted flights both in cost (estimated to be in the millions of dollars annually), and environmental impacts from increased emissions.

In addition to burning fuel to fly the extra distance, we will burn additional fuel to carry this fuel. For example, from SEA to DCA, the cost to carry the extra 700 lbs of fuel to fly around PRTC is about 70 lbs. Even if the military releases the airspace tactically, the extra fuel needs to be carried for dispatch purposes. To avoid carrying this fuel, we would need to know the airspace is available 5 to 6 hours prior to flight through it.

SO-7

BOX 68900 SEATTLE, WA 98168-0900/206 433 3200

3050

Severe Weather
Due to restrictive airspace constraints on the East Coast, it is essential for us to have route flexibility leading up to the constrained "catch points". On a daily basis, our routes could flex dramatically over the course of several hours due to weather. Because of the turbulence over and along the east side of the Rocky Mountains, Alaska Airlines reroutes flights further north than optimal to ensure they are safe from severe weather and turbulence hazards. The proposed ATCAA above FL260 prevents this northerly reroute away from terrain and would force flights into airspace that is already constrained by numerous MOAs and ATCAAs in the southwest increasing flight distance by more than 100 miles.

SO-8

Cumulative Impacts
While the direct impacts of delays, inefficient routings, and reduced weather avoidance routes are significant, the indirect impacts of flights being rerouted around the PRTC also need to be considered. According to the DEIS, more than 500 daily IFR flights between 18,000' and FL370 currently fly through the proposed PRTC. These aircraft would be forced to funnel through narrow corridors, similar to what happens today in the southwest due to military complexes R2508 and R4800. This compounds the impacts for the flights directly impacted as well as the traffic that now has to share the remaining available airspace.

SA-3

Alaska Airlines has determined that any expansion of the PRTC airspace above FL260 will cause safety concerns and an undue financial burden. We oppose development of the Powder River Training Complex as proposed and would like to work with the Air Force to develop an alternative that balances the needs of the military with those of commercial aviation.

GE-2

"The Voice of Aviation in Montana"

Aviation Organizations of Montana

November 12, 2010

Ms. Linda Devine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms. Linda Devine,

As the current President of the Board for the Aviation Organizations of Montana, I was requested to make written comment concerning the proposed expansion of the Powder River Military Operations Area. Of these organizations, some have been in existence for many years, one since 1939. At our last board meeting which was held October 16th 2010, we had a lengthy discussion concerning the proposal. At the conclusion of the discussion we had a unanimous vote of those attending to voice our negative opinion. This proposal would be detrimental to aviation as a whole in the State of Montana. The restrictions to commercial and private instrument flights would not be economically feasible to be rerouted during the times of activation, which would be quite extensive. With flight levels from 500 feet above ground level to 45000 feet above ground level, there is nothing that can penetrate this airspace safely with "see and avoid" tactics. Spray plane pilots and ranchers occupy the lower levels, with commercial and general aviation pilots occupying the middle to upper levels of airspace from approximately 1000 feet above ground level to a maximum of 45000 feet above ground level. We do not believe the full economic impact has been properly addressed and we are in agreement with many of our elected Montana officials. This is simply not a good proposal for the State of Montana. The Aviation Organizations of Montana is comprised of the following:

SO-7

SA-7

SO-22

1. Montana Pilots' Association
2. Montana 99's
3. Montana Flying Farmers
4. Experimental Aircraft Association
5. Montana Community Airport Assoc.
6. Montana Aviation Trades Association
7. Association of Montana Aerial Applicators
8. Montana Airport Managers Association
9. Montana Antique Airplane Association
10. Montana Seaplane Association
11. Montana Civil Air Patrol
12. Aircraft Owners and Pilots Association
13. Montana Aeronautics Division of the Department of Transportation

Assn. of Montana Aerial Applicators • Montana Airport Management Assn. • Montana Antique Aircraft Assn.• Montana Aviation Trades Assn.• Montana Flying Farmers • Montana Pilots Assn. • Montana Ninety-Nines • Montana Seaplane Pilots Assn. • Civil Air Patrol • Experimental Aircraft Assn.

3051

As you can tell from the list above this represents most aviation aspects in the State of Montana. With all due respect we would like to see the Airforce adopt option D. which would be no change to the current Powder River Military Operations Area.] GE-2

Sincerely,

Wade Cebulski

Re: Draft Environmental Impact Statement for Powder River Training Complex

Ms. DeVine,

The Aircraft Owners and Pilots Association (AOPA) represent the interests of more than 410,000 general aviation pilots and aviation enthusiast nationwide. On behalf of our members, we support the United States Air Force (USAF) and their need to conduct training in a manner in which they fight. However, the massive airspace expansion being proposed in the Powder River Training Complex (PRTC) Draft Environmental Impact Statement (DEIS) would be the largest Special Use Airspace (SUA) complex in the United States and cover an area of approximately 28,000 square miles, roughly the size of South Carolina. AOPA contends that the PRTC is an overly expansive airspace request that will severely and unnecessarily impact the national airspace system and the operators who fly in the affected airspace. The USAF has not provided sufficient justification for such a massive expansion of the airspace for year round activities.

While large areas of special use airspace and generous charted times of use translate into flexibility for the USAF, that flexibility results in substantial negative impacts on general aviation. The proposed PRTC will result in significant economic impacts to airports, flight schools, pilots, and small businesses that rely on general aviation. AOPA is also concerned with multiple safety issues related to the PRTC including high speed, low altitude maneuvering, deployment of chaff and flares, and limited radio communications and radar coverage. For these reasons, AOPA opposes the PRTC proposal for year round airspace expansion and provides the following concerns and associated impacts of the proposed airspace expansion.

Proposed airspace does not match demonstrated need

The PRTC proposal would establish four Military Operations Areas (MOA) extending from 500 feet above ground level (AGL) to 12,000 feet mean sea level (MSL) with charted times of use amounting to 44.5 hours per week. However, the DEIS states that the USAF expects to use most of these MOAs for just 15 hours per week. While charting 44.5 hours of use provides enormous flexibility for the USAF, it would increase operating expenses, increase delays, and degrade safety for 285 based civil aircraft and countless Visual Flight Rules (VFR) transient operators who will be required to traverse an active MOA to arrive or depart one of 39 airports underlying the PRTC. Pilots operating under Instrument Flight Rules (IFR) will be routed around the MOA's when they are in use and likely will incur delays as a result of reroutes. In addition, the proposal provides for the use of Notice to Airmen (NOTAM) to schedule SUA outside of charted times of use. With a minimal need provided in the justification for the proposed expansion, the extensive charted times as well as the allowance of additional flexibility seems excessive. .

SO-7
SA-7
SO-8
PN-5

According to page 2-40 of the PRTC DEIS, only 75 to 100 minutes per week will be spent at altitudes below 2,000 feet AGL. AOPA questions the need to activate airspace below 2,000 feet for the same duration as airspace above 2,000 feet when it is only expected to be used 10% of the time. Perhaps subdividing actual needed airspace would be a better solution than requesting a massive SUA with excessive charted times. Similar solutions could have resulted from early dialogue with the user community had they been part of the planning process from the conceptual phase of airspace development.

AM-26

AIRCRAFT OWNERS AND PILOTS ASSOCIATION

3052

Economic Impacts of the Proposal are Excessive

The USAF is required to give public use airports that underlie the MOA a 3 nautical mile radius and 1,500 foot exclusion area. However, this exclusion area does not allow for aircraft to ingress and egress the airport safely nor does it provide any accommodation to the 20 private use airports that would be unusable during times of PRTC SUA activation. Without real time SUA data, locally based and transient pilots will lose flexibility in choosing departure and arrival times at airports underlying the PRTC. In the long term, this reduction in flexibility will result in businesses and private owners relocating their aircraft outside of the PRTC to avoid the expense and delay associated with operating through expansive special use airspace.

AM-5

SO-10

Fixed base operators (FBO) rely on local and transient aircraft as their primary sources of income. When local operators begin relocating their aircraft to airports outside of the PRTC, income from fuel sales, hangars, and tie down fees will drop precipitously. Based on data contained in the 2007-2008 Montana Economic Impact of Airports Study, the average airport underlying the PRTC provides 5 jobs, $81,000 in annual payroll, and nearly $200,000 in economic activity to the surrounding community. With 19 publicly owned airports underlying the PRTC, this translates to approximately 95 jobs, $1,539,000 in annual payroll and $3,800,000 in economic activity in the surrounding communities directly attributed to the airport. This economic activity is not sustainable under the PRTC and will be eroded until reaching a point where operating an aviation business under the PRTC is no longer financially viable. Transient aircraft will be more likely to utilize an airport outside of the PRTC even if means renting a car and driving to their desired destination inside the PRTC. This will further erode the FBO's income through lost fuel sales and ramp fees. Operating margins for an FBO are extremely thin and even a small decrease in normal traffic levels will have devastating consequences to these small businesses.

SO-10

SO-5

The PRTC will destroy the flight training industry at 39 airports underlying the proposed airspace. In the DEIS, the USAF explained that one of the key drivers of the PRTC was avoiding expensive, unproductive commutes to distant ranges. The same can be said for general aviation pilots who are paying for flight training as well. Flight instructors would be forced to choose between conducting a flight in an active MOA with low altitude military aircraft operating at speeds in excess of 500 knots, or commute as much as 50 minutes to conduct the flight training outside of the SUA. A typical general aviation training flight lasts approximately 1.5 hours. Adding an additional hour and forty minutes of flight time to every flight lesson will more than double the cost of earning a pilot certificate. When faced with additional flight time expenses exceeding $7,000.00 over the course of their private pilot training, potential student pilots will simply drive to an airport outside of the PRTC, or forego learning to fly altogether. This is too high a price for civil aviation to pay when other options must be considered by the USAF to be a responsible steward of the national airspace system.

SO-26

We appreciate the USAF's willingness to return SUA to the National Airspace System (NAS) when it is no longer in use, as mandated by the Federal Aviation Administration (FAA) Joint Order 7400.2G, paragraph 21-1-8. Unfortunately, the lack of real-time information sharing makes it nearly impossible in the current airspace environment for non-participants to know the actual status of a SUA at a given time. Although the USAF plans to notify Air Traffic Control (ATC) when the airspace is no longer active, there is limited communication coverage in the PRTC area making it unlikely that general aviation pilots will be aware that the SUA has been deactivated, or is about to be activated. Because general aviation pilots as well as other operators do not have access to real-time SUA data, pilots are forced to typically rely on the charted times of use for a given SUA area. The excessive charted times of use and lack of real-time information compound the economic impacts of special use airspace.

AM-12

SO-8

3052

Ms. Linda DeVine
Page 3
November 11, 2010

Safety Concerns of Non-Participating VFR Traffic

General aviation traffic operating within the boundaries of the proposed PRTC use see and avoid to mitigate the risk of a mid air collision. The success of see and avoid is dependent on aircraft below 10,000 feet operating at or below 250 knots. The USAF plans to operate at speeds up to 540 knots within the PRTC. While this operation may be legal under the USAF's waiver with the Federal Aviation Administration (FAA), it does not make good sense nor is it a responsible use of this massive airspace area. At best, this operation will render see and avoid difficult to impossible. Despite the waiver permitting operations in excess of 250 knots below 10,000 feet, the requirements for see and avoid remain. The USAF has not explained how, at more than 500 knots, they plan to see or avoid a VFR aircraft operating legally within the active MOA.

SA-7

Because the proposed airspace will be accessible to non-participating VFR aircraft, there are increased risks associated with the release of chaff and flares that the USAF has not adequately identified. The flares burn in excess of 2000 degrees Fahrenheit for at least 500 feet vertically, creating a risk of the flare embers coming into contact with non-participating aircraft. With the failure rate of these flares at 1%, there is also a potential for an un-ignited flare (dud) to come into contact with a non-participating aircraft while in flight. The damage that would result from such contact would range from minor to disastrous and could potentially result in loss of life.

SA-5

SA-16

The use of chaff within the proposed MOA poses a similar risk. By design, chaff must form a cloud of metallic fibers at least 30 meters in diameter. The risks to non-participating civil aircraft unknowingly flying through one of these clouds includes, but are not limited to: in-flight windscreen blanketing, engine foreign object damage (FOD), turbine FOD, propeller FOD, aircraft environmental system contamination, and possible navigation and communication equipment interference.

SA-26

Summary

AOPA understands and respects the military's need to train. However, the massive scale of this airspace will have devastating impacts on the general aviation industry. The size and charted times of use are excessive, unjustified, and must be reduced. We strongly recommend the USAF utilize early and continuous dialogue with the user community during the development of additional SUA to meet training requirements. Based on the economic impacts and safety concerns with the proposed expansion of the PRTC, we strongly recommend the USAF go back to the drawing board and involve users in a meaningful dialogue to ensure any considered airspace expansion includes input from the user community. As proposed, AOPA opposes the PRTC due to the lack of justification for this expansive airspace design and its substantial impact on civil aviation. We appreciate the opportunity to provide comments on the Draft Environmental Impact Statement for the Powder River Training Complex.

RE: Powder River Training Complex (PRTC) Draft Environmental Impact Statement (EIS)

Dear Ms. Devine:

Basin Electric Power Cooperative is submitting this letter as its official, formal comments on the August 20, 2010, Draft Environmental Impact Statement (EIS) related to the expansion of the Powder River Training Complex (PRTC) in South Dakota, North Dakota, Wyoming, and Montana. This letter supersedes any other comments that may have been made on behalf of Basin Electric in any other public forum.

Basin Electric has long supported our men and women in uniform, and is proud to have several employees as active members of the National Guard. Military bases are key accounts and many of the base personnel are members of our distribution cooperatives. The Basin Electric cooperative family continues to work tirelessly to ensure that the bases and the members have a reliable and affordable power supply.

Basin Electric supports the need for the military to have adequate airspace for readiness training and wants to work constructively with the military and FAA on these issues. After review of the Draft EIS, we identified two items needing further clarification and/or possible modifications to the proposed training area:] GE-11

1. **Communications and radar coverage.** We are pleased that the Air Force expressed an interest in further developing the regional communications structure to support commercial and private aviation. Basin Electric believes this is important and commits to work with the Air Force on this issue, including support in the federal budget process for additional appropriations if needed. We look forward to a continued dialogue on this important issue.] AM-3

2. **Commercial airport buffers.** The Draft EIS indicates the MOAs' boundaries will come within 30 miles of larger commercial airports, such as Bismarck and Dickinson. However, manufacturer guidelines for aircraft used by Basin Electric, and many others common to general aviation, recommend descents of between 33 and 43 miles from the airport. Would extending the MOA boundaries to between 45 to 60 miles from these airports adversely affect the use of the training airspace by military aircraft?] AM-5

A Touchstone Energy® Cooperative

Equal Employment Opportunity Employer

3053

We sincerely appreciate the good working relationship that our members have with the United States Air Force. Our desire is that as the final EIS and decision are prepared, that all affected parties can find common ground to support military training and readiness while minimizing impacts to communities and businesses in the region. Thank you for your consideration of these comments. GE-11

Respectfully,

Ronald R. Harper
CEO & General Manager

RE: Powder River Training Complex EIS

Dear Ms. DeVine:

The purpose of this letter is to provide comments to the Powder River Military Operations Area (MOA) Environmental Impact Statement (EIS). Bismarck Airport (KBIS) is a Non-Hub primary commercial service airport serving Bismarck, Mandan and surrounding areas of North Dakota. Bismarck has three airlines that serve approximately 360,000 total passengers per year with direct commercial service to six non-stop destinations. Bismarck Airport has 70 Based Aircraft and two Fixed Based Operations (FBO's) serving all aeronautical users with fuel, maintenance, air taxi, avionics, upholstering, hangaring, and other flight line services. Two major energy companies also have hangars, aircraft and flight departments on our airfield. Bismarck Airport has among its tenants the North Dakota Army National Guard Army Aviation Support Facility. Bismarck Airport and the City of Bismarck are strong supporters of the military; however, we have concerns about the proposed expansion of the Powder River MOA.

The proposed MOA expansion will have several negative impacts on private and commercial aviation users in Bismarck that should be considered as this proposed expansion of the Powder River MOA is reviewed.

Aircraft departing Bismarck to conduct business at communities and airports within the proposed MOA will be limited to flying by Visual Flight Rules (VFR) when the expanded MOA is active. A business must be able to count on flight under Instrument Flight Rules (IFR) to get personnel into airports in the proposed MOA during inclement weather. We are concerned about safe and unlimited access to neighboring airports at Bowman, Elgin, Hettinger and Mott, which are under the proposed expanded MOA PR4. Bowman and Hettinger have community medical facilities that are serviced by fly-in medical specialists under IFR controlled airspace by

SA-3

SO-5

W:\2008 & Forward\Letters & Memos\2010\FAA Airspace Study Letter to Ms. DeVine.docx

2301 UNIVERSITY DR., BLDG #17 PO BOX 991 BISMARCK, ND 58502-0991 [T] 701-355.1808 [F] 701-221.6886 www.bismarckairport.com

3054

Part 135 and Part 91 aviation providers. These flights deliver medical specialists, on a scheduled basis, to area clinics from large regional medical facilities in Bismarck. There are approximately 80 medical flights that originate from Bismarck Airport each month. These flights are serviced by Bismarck's FBO's or private owners. The proposed MOA expansion would cause delays and cancelations to those teams of medical personnel who travel to serve those communities.

While the Air Force says that active emergency ambulance flights will be accommodated, routine travel by medical teams will be negatively impacted. Those teams routinely fly under IFR, an option not available when the MOA is active. Medical teams that experience delays and cancellations resulting from the MOA will find that they cannot count on air transportation as an efficient means of travel. As a result, these medical providers may stop their services to those communities altogether, eliminating convenient access to essential medical service to thousands of rural residents of southwestern North Dakota. The reduction in flights would also have a negative economic impact on the aviation service providers in those communities. SO-5

Charter operations will be impacted because they operate under more stringent flight rules. The unavailability of flight under IFR flight rules when the MOA is active will introduce unpredictability that will result in unnecessary delays and cancellations. SO-8

Hettinger and Bowman Airports have expended significant efforts developing and improving their airport facilities. They have installed automated weather reporting at their airports to improve dependability of air services by both charter and private operators under Instrument Flight Rules to their cities. These efforts will be negated whenever the PR4 MOA is active. IFR flights from Bismarck to these communities during these times are effectively eliminated during any scenario with limited ceiling and visibility. Both the communities and the aviation service providers will suffer social and economic hardship due to the proposed expansion of the PR MOA. SO-10

Oil and energy companies also fly daily trips from Bismarck Airport into and out of the airspace that is proposed in this expansion of the current Powder River MOA. The expansion of the MOA will introduce additional negative impacts because the flight route of many of these operations is across and through the expanded MOA. The re-routing around the proposed MOA will cause unnecessary financial hardship on these companies as a result of increased cost for aircraft time, fuel, lost productivity, increased maintenance, etc. SO-7

A harder to measure negative impact to Bismarck Airport will be when private and corporate pilots choose to go around the expanded MOA to "avoid the hassle" of passing through or SO-6

W:\2008 & Forward\Letters & Memos\2010\FAA Airspace Study Letter to Ms. DeVine.docx

3054

around it. As a result they will choose a route that avoids Bismarck altogether resulting in more social and economic hardship due to loss of fuel and support services sales at our FBO's at a time when they are already hurting due to the national economy. SO-6

North Dakota is the number one producer of 13 agricultural commodities so changes that negatively affect agricultural production will be felt throughout the economy of all of North Dakota. We have heard comments about the proposed MOA from area crop sprayers and others (USDA Animal Damage Control) who routinely fly at low levels (below 500') to conduct their business. These operators are concerned about little or no vertical separation between them and low flying, high speed military aircraft when there is no radar coverage at this altitude. If this proposed MOA expansion leads to increased crop losses and livestock depredation due to these operators inability to perform their functions, the negative effect on agriculture will ripple through North Dakota's number one economy. SA-7 SO-11

We are concerned about the negative effects of the expanded MOA on the three (3) airlines serving Bismarck. All three (Delta, United and Allegiant) have direct flights to four (4) destinations to the south and west of Bismarck requiring them to fly above or around the proposed MOA. When departing Bismarck they will have to either climb rapidly to over 18,000 feet within 35 miles or fly south into South Dakota and then back to the west before being able to fly direct to their destinations. Both scenarios add costs and time to the airlines and the passengers who use them making both options less efficient. Bismarck already has higher than average fares for airline travel. This proposal will drive our air fares even higher by the inefficiency that it creates for the airlines, this translates into economic hardship for our citizens. When these same airlines approach Bismarck to land, the options are the same: fly over or go around. If they fly over, they will have 35 miles or less to come down from over 18,000 feet making a more rapid descent likely. This may cause alarm and discomfort for some of passengers. We understand that all three (3) airlines will be providing their own separate comments on this proposal. AM-5 SO-7 AM-5

With proposed 500 Foot Above Ground Level Military Operations, safe separation of aircraft is questionable. We feel the lack of low altitude radar coverage and lack of voice communications as well as the coordination/communications issues that will be necessary between the three (3) Air Traffic Control Centers (ATCC's) at Salt Lake, Denver and Minneapolis, has not been adequately addressed. With proposed 500 Foot Above Ground Level Military Operations, safe separation of aircraft is questionable. This puts military and civilian aircraft in a situation with higher potential for mid-air collisions. We also feel the current NOTAM system is inadequate to inform aviation users of changes in use of the MOA when it is active. AM-3 SA-1 AM-12

W:\2008 & Forward\Letters & Memos\2010\FAA Airspace Study Letter to Ms. DeVine.docx

3054

Because of these concerns and others there will be an overall decline in use of the Bismarck Airport and adverse social and economic impact on our airport, community and region. We know the impact of aviation on any community is huge. Bismarck Airport's economic impact has been calculated at $178,759,000 a year with 558 direct jobs. This information comes from the 2004 North Dakota Aeronautics Commission Local Economic Impact of Aviation report. This does not take into account increases of activity resulting from increased oil and gas exploration in the region. If this proposed expansion gets approved the airport's economic engine will be degraded!

SO-10

SO-17

While Bismarck Airport and the City of Bismarck understand need for Military Operation Areas to train our military, the size of this expansion is unprecedented, increasing the existing MOA by four times its current size. The MOA when active will impede access to medical facilities, negatively impact aviation business, airlines and cause traffic separation concerns in an area of limited radar and communications coverage. The Bismarck Airport requests that the USAF take the no-action alternative. None of the other alternatives (A-C) presented will alleviate the socio-economic hardships placed upon the aviation users and communities that will be affected by the Air Force's proposal.

GE-2

Thank you for the opportunity to comment

Sincerely,

Gregory B Haug
Airport Manager

Langley AFB, VA 23665-2701

Dear Ms. DeVine:

The Wyoming High Plains District Office of the Bureau of Land Management (BLM) is supportive of the Proposed Actions described in of the Powder River Training Complex Environmental Impact Statement. Upon review, I have comments regarding two potential impacts on fire operations within the High Plains District. I would appreciate your consideration in adopting the following mitigations to the final approved plan: GE-1

- Impact one – Deployment of chaff and flares, increases fire risk to public lands administered by the Bureau of Land Management.

  Recommended Mitigation – Notify Casper Interagency Fire Dispatch Center at 307-261-7691, when training within the Wyoming portion of the Power River Training Complex includes deploying chaff and flares. SA-5

- Impact two - Air Space Conflicts

  Recommended Mitigation – Notify Casper Interagency Fire Dispatch Center, Air Desk, at 307-261-7695, when training flights are in the Wyoming portion of the Powder River Training Complex. AM-12

Thank you for your consideration and the opportunity to comment. For further information regarding the content of these comments and recommended mitigation measures, please contact the BLM, High Plains District Fire Management Officer, Jay Esperance at 307-261-7690.

Sincerely,

Stephanie Connolly

NOV 15 2010

Ms. Linda DeVine
PRTC EIS Project Manager
HQ ACC/A7PP
129 Andrews Street, Suite 337
Langley AFB, VA 23665-2701

Dear Ms. DeVine:

Thank you for the opportunity to provide public comment on the Powder River MOA Training Complex (PRTC) draft Environmental Impact Statement (EIS). The United States Department of the Interior (USDI), Bureau of Land Management (BLM), Eastern Montana/Dakotas District (EMDD), Division of Fire and Aviation within the Eastern Montana Fire Zone (EMFZ) has reviewed the proposal and would like to provide comments. As our agency is a primary user of the current and proposed airspace, we would like to see the following concerns addressed in the final Environmental Impact Statement and in your deliberation toward choosing your preferred alternative to implement:

1) PRTC PROPOSED ACTION ALTERNATIVES
During the 2008 public scoping period, our office provided you with a request to consider another alternative as was stated below:

> "BLM would also like DoD to evaluate one additional alternative. Please consider, in addition to the existing MOA, adding only one area identified as area PR-3 MOA in the proposal literature. This MOA location north of the existing MOA would add space for additional DoD training and also have the least impact on the Eastern Montana Fire Zone (EMFZ) as far as the number and frequency of aircraft to schedule/deconflict."

In reviewing the PRTC draft EIS, the military determined this alternative would not provide adequate training airspace. In consideration of the proposed alternatives, the Fire and Aviation Division of our BLM office would prefer to support the No-Action Alternative over the proposed Alternatives A, B, and C. This is due to the following considerations: potential increased man hours that would be required to coordinate/deconflict the majority of our emergency response flights, which now occur in areas not designated as MOA airspace; potential increased man hours that would be required to coordinate/schedule almost daily fire detection flights during the summer that would occur in the majority of the proposed PRTC identified MOA's; lack of assurances that DoD aircraft can be contacted immediately in "real time" to ensure they will relocate or curtail low level training operations and safely yield to higher priority emergency response aircraft entering active MOA's.

GE-2

SA-19

Should the DoD elect to adopt an alternative other than the No-Action Alternative, then the Fire and Aviation Division of our BLM office would prefer the implementation of proposed actions as presented in Alternative B. This is due to the following considerations: our area of highest

DO-2

emergency response aircraft activity occurs over the Ashland Ranger District of the Custer National Forest (adjacent to theNorthern Cheyenne Indian Reservation) where there is currently no MOA established- and the option to not establish PR-1A/B MOA and Gap A MOA would help to ensure that our highest use area remains minimally impacted; savings of taxpayer dollars realized in fuel conservation by utilizing MOA's located closer to established military bases, where it is less likely for our emergency response aircraft to be dispatched to (thus providing for fewer interrupted military training sorties). DO-2

2) PRIORITY TO LIFE FLIGHT & EMERGENCY RESPONSE AIRCRAFT
Our staff attended public hearings for the PRTC draft EIS in Miles City, MT on Friday, October 15, 2010. DoD personnel addressing the attendees at those public hearings confirmed that Life Flight and Emergency Response Aircraft activity held higher priority for MOA airspace use than military training sorties within the existing and proposed MOA's.

The BLM would like to see the Final EIS address exactly how the DoD intends to uphold MOA airspace use prioritization. While the scheduling of known flights involving resource project missions and non-emergency fire reconnaissance is understood, the process of having military training missions/sorties yield to Life Flight and Emergency Response Aircraft is not well addressed. Verbiage within the draft EIS indicates that emergency-related activities would be avoided by military training aircraft and that ATC would notify the training aircraft of the emergency. After being contacted, the affected military training mission would avoid the incident area, move to another active airspace or return to base in accordance with agreed-to procedures. The draft EIS does not seem to address the additional impacts to public and civil entities involved with emergency related missions should the existing MOA be expanded into the PRTC. SA-19

The BLM would like the final EIS to adequately address the impacts to public and civil entities who provide aircraft with rapid access in response to emergency related missions. The BLM would also like to see the specific procedures and protocols of prioritized MOA airspace use be well documented for correct implementation. The nature of life flight and emergency response aircraft missions are unpredictable as to specific launch times. Any steps taken to ensure military aircraft training at low level (i.e. below 5000 feet AGL) yield to higher prioritized missions (by altering training areas or curtailing operations) will need to be immediate and real time. SA-19

3) IMMEDIATE "REAL TIME" COMMUNICATIONS WITH MILITARY AIRCRAFT AM-12
When an interagency dispatch center launches public aircraft to respond to a wildfire, these aircraft and pilots meet established standards to ensure operational safety. These interagency fire aircraft are required by policy to maintain radio communications with the dispatching unit at all times. The jurisdictional agencies bare the expense of radio communication systems to ensure that aircraft can be contacted real time in the interest of protecting life and property. AM-3

One of the greatest concerns of the Fire and Aviation Division within our BLM office involves the delay in relaying airspace use prioritization to military aircraft currently in training within the MOA. Verbiage within the draft EIS indicates the DoD is aware that there is limited communication capabilities in the region. Specific verbiage within the draft EIS states "radar and radio communications are limited below 12,000 feet MSL and in some areas are limited below FL180". (see page ES-14) However, also within the draft EIS there is verbiage stating that the military "would establish communication procedures to ensure the ability to recall the military aircraft from the low altitude MOA's" (see page 2-110) and that the military "would

establish communication procedures to ensure deconfliction with emergency flight operations within the proposed airspace" (see page 2-110).

In another section of the draft EIS, there is verbiage which seems to contradict this where it states "there is no proposal for increased radio frequency coverage or radar coverage for the PRTC airspace where current coverage is limited" (see page ES-18). DoD officials have informed us that it may take up to 30 minutes for either them or the controlling ARTCC to contact military aircraft currently involved in low level flight profiles. Our response times enable us to have aircraft within MOA airspace in as little as 15 minutes. Because military aircraft in training are not required to maintain immediate "real time" communications to yield the airspace to higher priorities, there can be an unsafe period of at least 15 minutes, and likely more, of increased potential for mid-air collisions. This period of increased risk and exposure would require mitigation to address the effects to other airspaces uses.

AM-3

SA-19

The BLM would like to see the DoD address in the final EIS how they will ensure that military training aircraft will be contacted immediately in "real time" to be informed that they must yield to the more critical life flight and fire suppression aircraft in the interest of promoting mid-air collision avoidance. Incident response dispatch centers would need some form of confirmation that military aircraft have indeed been contacted and acknowledge that they are yielding low altitude flight profiles to higher priority emergency response aircraft occupying the airspace.

AM-12

SA-19

4) COLLISION AVOIDANCE UNDER V.F.R. CONDITIONS
Due to the nature of each agency mission, "see and avoid" may not be sufficient mitigation for mid-air collisions. BLM would like DoD to address more reasonable and effective avoidance measures other than "see and avoid" VFR procedures to prevent mid-air collisions, and seek to increase the safety of our aviation personnel.

SA-1

5) REASONABLE AVOIDANCE MEASURES
There exists predictable periods of airspace usage based on historical data from which reasonable mid-air collision avoidance measures can be implemented. For example, the BLM rarely responds to wildland fires with aircraft from November through April. The shoulder months of the fire season include May and October where average fire season use of aircraft is low. Usage increases to a moderate level in June and September. Our period of highest aircraft use is July and August, when ground fuels are most receptive to ignition sources such as lightning.

In addition, the majority of our incidents are concentrated within a known geographical area. With the likelihood of aircraft responding almost daily to fire dispatches into what would likely be the PR-1A/B MOA and Gap A MOA during what is typically a two month period, it would seem appropriate for the DoD and partnering agencies such as the BLM to adopt reasonable avoidance measures in the interest of mid-air collision avoidance. This falls in line with your planned actions to avoid altitudes that would interfere with commercial aircraft. In addition, many of our aircraft have to transition from established bases to the TFR area each mission to reload with fire suppressants/retardants and thus have a period of risk during flight not addressed by implementing the TFR.

SA-1

Please find attached a 20-year fire occurrence map indicating historical incident locations. The majority of fires on the EMFZ are "short duration" which means that the use of aircraft to aid in the suppression of these fires typically lasts only 1 to 2 days. It is impractical to establish a TFR for multiple fires when most are going to be contained within 2 shifts. It would be more practical if the EMFZ could call the DoD scheduling desk and let them know that we have active fires requiring the use of aircraft and that our aircraft will remain 3500' AGL and below (our

AM-12

3056

ceiling height for Fire Traffic Area dimensions). If the DoD would initiate avoidance measures such as establishing their training floor (hard deck) with a reasonable buffer (say 5000' AGL) then the establishment of TFR's that could number into the hundreds annually during June through September may be avoided. USAF personnel informed BLM that DoD training is typically done either at low level or well above our Fire Traffic Area ceiling. Ideally it would save multiple agencies tremendous coordination time, effort, and expense if no low level DoD training were held during the primary fire season when the EMFZ utilizes aircraft on active incidents (typically between June through September). AM-33

It would seem to be less efficient and more costly when low level military training missions within the proposed PR-1A/B MOA and Gap A MOA are curtailed or interrupted repeatedly from frequent emergency response aircraft dispatches. When considering the data presented in the draft EIS concerning the Average Annual Baseline Training Hours and Estimated Annual Day-to-Day Time and Altitude Distributions, implementing a 5000' AGL low level VFR training floor as a temporary avoidance measure during the highest fire occurrence period would seem a reasonable and realistic solution.

Verbiage within the draft EIS indicates that the military would establish reasonable temporary or seasonal avoidance areas for concerns with other topics already identified, such as over ranches during calving/weaning/branding seasons or cultural native American/tribal events. Specific verbiage indicates the military "would establish reasonable temporary or seasonal avoidance areas or could adopt other measures identified in Government-to-Government consultation..." (see page 2-100). The BLM would like the PRTC final EIS to address reasonable avoidance measures which would include no low level military training flights during the highest incident response months within all existing and/or proposed PRTC MOA's. AM-33

6) SCHEDULING OF LONG DURATION MULTIPLE MOA FLIGHTS

With the current size of the Powder River MOA, it has been practical to work out a schedule with DoD when fire detection aircraft need to patrol the Eastern Montana Fire Zone (EMFZ). Lightning maps from the previous storms determine areas that are to be flown by detection aircraft. Historically the majority of fire activity on the EMFZ is south of Interstate 94. To date, we have been successful to direct flight routes through the current MOA during periods of DoD inactivity.

However, with the proposed expansion of the PRTC spanning from Billings, MT to Bismarck, ND this would end up encompassing most of the southern half of the EMFZ, which is where our predominant fire activity occurs. At public hearings held in eastern Montana during October of 2010, DoD officials commented in their presentations that expansion of the current MOA into the PRTC would not impact Life Flight or Emergency Response Aircraft missions. Is there analyses within the draft EIS to support this? Incidents within the current MOA utilizing aircraft require man-hours to coordinate and deconflict the airspace each time. With the proposed expansion, that workload will increase proportionately. SA-19

How will BLM be able to do late morning/early afternoon VFR reconnaissance flights (typically lasting about 3-4 hours due to the size of the area of jurisdiction) to cover that area in the proposed Powder River 1, 2, and 3, which may need to occur daily from June through September? Would DoD schedulers be able to reserve a 3-4 hour time slot in late morning/early afternoon for Powder Rivers 1-3 that will facilitate a VFR detection flight daily through those 3 MOA's for basically a 4 month period? AM-33

7) FUTURING POTENTIAL MOA AIRSPACE USAGE
The PRTC Draft EIS indicates that expansion of the existing MOA into the PRTC will benefit both current and future DoD training needs, yet there is very little discussion found within the document to address potential future airspace use. The BLM would like to see the EIS address how expanding the current MOA could potentially allow additional training opportunities that have to date been prevented, due primarily because of size. PN-2

8) MISCELLANEOUS UNANSWERED QUESTIONS
Most of the following questions were presented during the public scoping period and answers were either not provided or could not be found within the draft EIS:

- What safety measures beyond see-and-avoid will the DoD implement to buffer between military and civil or public aircraft operating concurrently within an active MOA? SA-1
- Will there be quantity limitations as to how many military aircraft will occupy any given PRTC area at any one time? AM-27
- As ARTCC's covering the proposed PRTC are divided between Salt Lake City, Denver, and Minneapolis, will there be a communication gap in contacting military aircraft that are moving between MOA's as ARTCC's hand off DoD aircraft to each other? SA-4
- Will the FAA be considering moving ARTCC jurisdictional boundaries to simplify coverage within the PRTC?
- How will the scheduling of non-DoD aircraft occur within the MOA's during the quarterly "mass" large force DoD exercises (LFE's) that are anticipated to last from 1-3 days? AM-12
- If the DoD will be monitoring seasonal fire conditions to determine when to discontinue use of chaff and flares over receptive fuels (i.e. NFDRS; Red Flag Warnings; etc.), how and when will the decisions be made to implement and rescind these actions? SA-5
- What sort of aircraft chaff/flare training is available to educate interagency wildland fire investigators? SA-27
- How quickly will newly used flares and chaff deteriorate so that fire investigators who find them at fire origin locations can determine that the fire could not have started from recently utilized or misfired flares?
- With a larger area to facilitate training of more mission profiles, what are the additional impacts of military ground assets that will likely be integrated into the local training should the MOA expand? CM-2
- USAF personnel stated that there is one large fixed and two mobile pedestals used as threat emitters in 15 locations currently within the Powder River MOA. They also stated that these threat emitters require electricity and phone connections, and are therefore moved infrequently. The USAF representatives said that no new threat emitters were anticipated for installation, as current emitters would be adequate for the entire expansion. Should long term needs dictate the need for additional threat emitters, how will the DoD undertake NEPA analysis tiered to the final EIS?
- Will the military include the use of AWACS aircraft during the Large Force Exercises (LFE's) to enhance the realism of an actual large force mission and concurrently increase the safety of civil, public, and military aircraft within the MOA? AM-27

Thank you again for the opportunity to provide input into the final EIS. If you have any general questions, you may contact Kathy Bockness, Planning & Environmental Coordinator for the Miles City BLM Field Office, via phone at 406-233-2844.

Aside from the comments above to the Draft PRTC EIS, the Montana/Dakotas BLM State Office currently has a signed Memorandum of Understanding (MOU) between the BLM and Ellsworth Air Force Base in South Dakota where scheduling of the existing MOA occurs. While this document is adequate toward assisting our agencies in achieving mutual objectives of shared airspace usage within the existing MOA, any expansion of the existing Powder River MOA into a larger PRTC would necessitate changes be made to the agreement to address the additional impact.

GE-11

Personnel who assembled the original MOU agreed that should the MOA be expanded into the PRTC, the document would have to be updated to reflect changes such as the structure of an expanded MOA or inclusion of other affected agencies. Discussions then addressed the likelihood of formulating a MOA committee to address issues/concerns by the identified agency partners as well as development of a more inclusive MOU.

In consideration of the large number of civil and public entities, of which may include city, county, state and federal agencies and other potential partners which could be affected by implementing an expansion to the existing Powder River MOA.....it is requested that a multiple agency "umbrella" Memorandum of Understand (MOU) be developed. We would encourage that development of the MOU be accomplished by open invitation and collaborative teamwork in good faith from interested partners, with periodic meetings of an area MOA committee to review concerns and make needed updates.

NP-10

If you require additional specific information or need clarifications, you may contact Kevin Gappert, Unit Aviation Manager for the Fire and Aviation Division of the Eastern Montana Fire Zone (EMFZ), via: phone at (406) 233-2909 office or (406) 853-5163 cell; email at kgappert@blm.gov or write him at BLM, 111 Garryowen Road, Miles City, MT 59301.

Sincerely,

M. Elaine Raper

To: Ms. Linda De Vine

From: Bowman, North Dakota Airport Board

Subject: Powder River Training Area

We the undersigned Airport Board members are very concerned about the proposed final impact draft presented at the public hearing, in Bowman, North Dakota, September 22. Bowman would be directly under Powder River Area 3. We are in the process of building a new airport to accommodate the growing energy industry in our area. This energy growth, along with small businesses and agricultural commodity production are essential for the survival of our communities. The expanded Training areas would greatly impact this growth potential. SD-10

We hope the recommendations include raising the Area 3 floor to 10,000 MSL, which would greatly reduce the impact of our flight operations. DD-4

Alternative C would be our next choice associated with the Powder River proposal.
In conclusion, we hope these recommendations and concerns are considered in the final Powder River impact study. Thank you for your attention. DD-5

Re: Powder River MOA Proposed Expansion

Ms. LeVine:

Greetings, we appreciate the invitation to comment on the proposed expansion of the PRMOA. As proposed, the expansion will have a negative impact on our business, CityServiceValcon. We provide aviation fuel and related services to airports in the PRMOA area.

It is our view that given the complexity and restrictions of the PRMOA, that sales to our existing customers in the affected area will be reduced. Fully 75% of the business is generated from transient aircraft. Should the result be only a 25% reduction in sales, the impact will be $1,903,000.00 annually. SO-5

In addition, this student pilot finds the concept of VFR "See and Avoid" in an area with B-1's, B52's, F-16's, etc. operating at speeds exceeding 500 kts. Without radar coverage and possibly with their lights off is dangerous. Should this proposal move forward, please consider adding layers that would allow through traffic such as 8,000 – 12,000 MSL and 16,000 – 24,000 MSL to allow transitioning aircraft through MOA and improvements to radar and radio coverage. Proposed activities such as supersonic flight, live flares, defensive chaff, Lights-out NVG training, closure rates far exceeding what is acceptable to the FAA for civilian operations, lack of radar and radio coverage throughout the area. I remain convinced that these are operations which should be conducted in Restricted Airspace not in a MOA. Lastly, the addition of CTAF to military aircraft would be considered wise. SA-7 AM-26 AM-11

Sincerely:

Breezy Burlison

Langley AFB, VA 23655-2769

Re: (a) Powder River Training Complex Draft Environmental Impact Statement (EIS)
(b) FAA Airspace Study 10-AGL-6NR

Delta Air Lines serves more than 160 million customers each year within its United States and global network, Delta and the Delta Connection carriers offer service to more than 350 destinations in nearly 70 countries on six continents. Delta has a significant presence in the Midwest and Rocky Mountain area, including service to several cities affected by the proposed Powder River Training Complex, and flights which traverse the PRTC area flying to and from the west coast everyday. Delta Air Lines strongly supports the training needs of men and women in uniformed service to our country. Our forces deserve the best training possible, including the ability to train in realistic combat conditions.

While Delta initially supported the PRTC proposal, changes have occurred in the proposed use times that force us to withdraw support. The first briefing interaction took place in 2008 through the RTCA ATMAC Airspace Working Group (AWG) with mixed results and an apparent change is use plans. The timeline follows:

- Spring 2008 - the AWG formed a sub-group with a primary task of receiving and addressing the proposed MOA and ATCAA changes concerning Powder River from an aviation community perspective. The AWG sub-group met with the FAA and USAF on several occasions

- March 2008 – first brief to the AWG. PRTC proposes to create three Gap MOAs and three Gap ATCAAs to serve as specially scheduled airspaces for *two two-hour time blocks an estimated one to two days monthly*
- June 2008 – full AWG meeting dedicated to Powder, included USAF proponents and environmental contractors
- February 2009 – update presented by USAF and FAA Central Service Center
- June 2009 – verbal update from USAF (no progress)
- September 2009 – verbal update presented by FAA Central Service Center (no progress)
- March 2010 – update from USAF – maps and schedule
- May 2010 – email update from USAF (no progress on aeronautical review)
- August 2010 – last AWG, ZDV provides update on Powder, no Service Center update, USAF email update. *MOA activation plans now include Mon-Thurs, 0730-1200, and 1800-2330, and Fridays, 0730-1200*

In each briefing, the USAF described the need for quarterly Large Force Exercises lasting 1 to 3 days each per calendar year and Delta was supportive of this proposed frequency of use, even though high and low altitude routes would be affected. At no time was daily use indicated. Unfortunately, the USAF appears to have altered its use plans to allow for Monday – Friday scheduling of the MOAs with only non-specific mention of the use of the overlying ATCAAs FL180-260, and FL260 and above. We find no justification which supports use of the areas, especially the high areas, at greater frequency than the quarterly LFEs that were originally described. Utilization of the airspace on a Monday-Friday basis could have significant impact on Delta's service to local communities such as Rapid City, Bismarck, Billings, Bozeman, etc., and the impact to high altitude, overflying traffic would cause delays and reroutes affecting on time performance and fuel burn.

PN-5

SO-7

3059

In addition, it does not appear as if the USAF has considered the tenets being put forth in the recent National Special Activity Airspace Proposal (NSAAP) of which it was a party. NSAAP Section 5.2.2 spells out specific scheduling requirements for real-time needs, rather than a 'blanket' schedule period during which the MOA/ATCAA may or may not be used. Delta strongly recommends that the USAF support this process in reviewing its PRTC proposal. AM-12

As it is currently proposed, it is with regret that Delta Air Lines must withhold support for the Powder River Training Center initiative. GE-2

Respectfully,

Lorne Cass

ER 10/725

Ms. Linda Devine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley Air Force Base, Virginia 23665-2769

Dear Ms. Devine:

The U.S. Department of the Interior (Interior) has reviewed the U.S Air Force's Draft Environmental Impact Statement (DEIS) for Powder River Training Complex, Ellsworth Air Force Base (AFB), South Dakota. The U.S. Air Force (USAF) seeks to improve airspace assets for required training by B-1 aircrews stationed at Ellsworth AFB, South Dakota and B-52 aircrews stationed at Minot AFB, North Dakota. The USAF proposes to develop the Powder River Training Complex to improve training through establishing new airspace and modifying existing airspace.

Interior submits the following comments under the authority and provisions of the National Environmental Policy Act (42 U.S.C. 4371 et seq.), the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. §§1531 to 1543 et seq.), and the Migratory Bird Treaty Act (16 U.S.C. 703).

FISH AND WILDLIFE RESOURCES

General Comments

Under the ESA, Federal agencies are required to review their proposed activities to determine whether species federally listed as threatened or endangered, or habitat(s) designated by the Interior as critical habitat, may be affected. If such a determination is made, formal interagency consultation with the U.S. Fish and Wildlife Service (USFWS) is required under Section 7(a)(2). If the USAF determines that the selected alternative may (either adversely or beneficially) affect federally-listed species or critical habitat, please contact the USFWS' Field Office (phone (605-224-8693) in Pierre, South Dakota, to initiate formal consultation.

In addition, section 7(a)(1) of the ESA requires Federal agencies to use their authorities in furtherance of the purposes of the ESA, i.e., "...to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, to provide a program for the conservation of such endangered species and threatened species, and to take such steps as may be appropriate to achieve the purposes of the treaties and conventions."

The DEIS does not explain how the USAF will meet its 7(a)(1) responsibilities for this project. We recommend that USAF contact the USFWS Field Office in Pierre, South Dakota, to establish reasonable temporary or seasonal periods when impacts will be avoided, or adopt other conservation measures to avoid and minimize intrusive impacts upon federally listed threatened, endangered, or candidate species. In particular, USFWS recommends that measures be developed to avoid impacts to endangered whooping cranes (*Grus americana*) which migrate through the area, and to two species that are candidates for listing that breed in the project area: Greater sage-grouse (*Centrocercus urophasianus*) and Sprague's pipit (*Anthus spragueii)*. A full analysis of the direct (noise, visual stimulants) and indirect effects (fire) from chaff and flare exercises on federally listed threatened, endangered, or candidate species should be considered.

BI-8

The USFWS also recommends that mitigation measures include limited operations of low-level flights in the Powder River 4 Military Operations Area during spring and fall bird migration.

BI-6

Specific Comments

Sprague's pipit has been added as an ESA candidate species since the DEIS was completed. The USFWS recommends that affects of the project on Sprague's pipit be addressed under the section "Threatened, Endangered, and Other Special Status Species," which begins on page 4-75.

BI-9

NATIONAL PARK RESOURCES

General Comments

The National Park Service (NPS) is concerned the proposed project will potentially adversely impact the soundscapes, visitor experience, cultural resources, and sacred sites of Little Bighorn Battlefield. Many of their concerns were raised conceptually in a letter dated July 24, 2008 in response to the Notice of Intent to prepare the EIS.

The mandate of the National Park Service (NPS) is to preserve and protect the scenery, and natural and cultural resources of parklands, such as Little Bighorn Battlefield for the enjoyment of the American public, and to leave them unimpaired for the enjoyment of future generations (16 USC 1-4). The "scenery" includes the natural soundscape, as well as the landscape (NPS *Management Policies 2006*). A soundscape refers to the total acoustic environment of an area. The soundscape of a national park, like air, water or wildlife, is a valuable resource that can easily be degraded or destroyed by inappropriate sound levels and frequencies.

CU-2

According to the Little Bighorn Battlefield National Monument General Management Plan (GMP) (updated 1995), "The primary purpose of Little Bighorn Battlefield National Monument is to preserve and protect the historic and natural resources pertaining to the battle of the Little Bighorn and to provide visitors with a greater understanding of those events which led up to the battle, the encounter itself, and the various effects the encounter had on the two cultures involved".

A portion of the National Monument is actively administered and maintained as Custer National Cemetery and is the final resting place of approximately 5,000 U.S. veterans and dependents. The National Monument contains 2 parcels of land separated by 5 miles, the Custer Battlefield unit and the Reno Benteen Battlefield, with a combined acreage of 786 acres. The Custer Battlefield unit has been protected since 1879, and the Reno Benteen unit since 1926, first by the War Department as Custer National Cemetery, and later (since 1940) by the NPS. The entire battlefield is listed on the National Register as Custer Battlefield Historic District 1 and Historic District 2 (Reno Benteen Battlefield).

Under the 1995 GMP, the battlefield is managed as a historic zone, "...where all activities would be managed to preserve, protect, and interpret cultural resources and their settings." The NPS has worked extremely hard to preserve the landscape, vegetation, setting, and feeling of the battlefield to as closely as possible evoke the landscape and conditions of 1876. A recent Cultural Landscape Inventory (2010) for the National Monument found the cultural landscape retains a high degree of integrity and concluded that "...despite external encroachment and ever increasing visitation, Little Bighorn largely retains its qualities of remoteness and history. The natural setting of the battlefield appears much as it did in 1876, with its scattered markers in isolation or in larger clusters poignantly expressing a moment frozen in time that can be felt and appreciated by visitors to the site." The National Register program identified seven aspects of integrity: Location, Design, Setting, Materials, Workmanship, Feeling, and Association. Retention of these qualities is essential for a property to convey its historic identity or evoke its appearance during a significant period in history. Little Bighorn Battlefield's cultural landscape retains the integrity of all seven aspects. CV-2

Soundscapes

Under the proposed action in the EIS, the National Monument would be included in area PR-1B-MOA, which would be from 500 feet above ground level (AGL) up to, but not including 18,000 mean sea level (MSL). On Page 3-60, Table 3.2-3 (Average Frequency of Military Aircraft Noise Events at Selected Noise-Sensitive Locations), contains a footnote that the published aircraft avoidance area is 0.75 nautical miles horizontally and 2,000 feet AGL for the National Monument. However, the reference for this footnote should be noted (Federal Aviation Administration Advisory Circular, FAA AC-91-36D), as the general public may not know where to find this information. It should also be noted that this avoidance regulation is voluntary as aircraft are requested, but not required, to maintain a minimum altitude above noise sensitive areas. Overflights over 2,000 feet are restricted above the National Monument under the National Park Air Tour Management Act of 2000 (Public Law 106–181). The area above the National Monument does not currently have military special use airspace or training operations. Under the proposed action, Large Force Exercises (LFEs) could occur above Little GE-15

Bighorn for 1-3 days per quarter. This would include supersonic flights for up to 10 days per year. Training exercises would include the deployment of chaff and flares. The EIS notes that three aspects of the increased noise could cause environmental impacts: 1) increases in ambient noise levels, 2) low-level startle effects; and 3) sonic booms. We have concerns about the effects of all three types of noise on soundscapes, visitor experience and cultural resources, and we disagree with the assertion that "Infrequent overflights over 2,000 feet would not be expected to be perceived as a significant intrusion to a National Monument" (EIS Executive Summary, page ES-24). LU-2

Acoustic data collected by the NPS at Devils Tower National Monument during June and July, 2010, show that ambient conditions in that park are very quiet. The daytime median exceedence level (L50) was 29.8 dBA (the sound pressure weighted [A] level given in units of decibels) and 35.0 dBA at the monitoring locations. Put another way, the percent of time the ambient sound level was above 35 dBA was less than 5 percent of the time from 0700 hours to 1900 hours, and less than 1 percent of the time from 1900 hours to 0700 hours. Although the NPS has not conducted acoustic monitoring at the National Monument, we would expect the ambient levels would be similar away from the road or visitor center in areas where a visitor would expect to have solitude and a contemplative atmosphere.

Thresholds of significance that have been established by the Federal Aviation Administration (FAA) are based on community response. FAA Order 1050.1E notes that special consideration needs to be given to the evaluation of the significance of noise impacts on noise sensitive areas within national parks. The threshold cited in the Draft EIS, 55 DNL (Day-Night Average Sound Level), as the threshold below which adverse impacts would not be expected to occur does not adequately address disruption of tranquility or disruption of solitude. Although the noise analysis in the Draft EIS is very detailed and describes the types of impacts that would occur at various levels of noise, no specific discussion is provided as to how thresholds of significance were defined in determining impacts of noise; for instance, negligible, not significant, to the resources described in the document. In other words, it is not clear how conclusions about impacts were determined. NO-4

Visitor Experience and Soundscapes

The National Monument is of enormous significance to American history, the American public, and the 280,000 to 420,000 visitors who visit the site annually. The National Monument is the second most visited tourist site within the state of Montana, and its economic importance to Southeastern Montana cannot be underestimated. Additionally, it has great significance to the U.S. Military and their Crow and Arikara allies, who suffered one of their most famous defeats at this site in 1876 at the cost of over 260 men, and to the Cheyenne, Lakota, and Arapaho tribes whose victory at this site also came with significant losses of warriors and noncombatants. CU-2

Today, many Americans, Veterans, and Tribal members view Little Bighorn Battlefield as a solemn and sacred place of reflection, where they can come reflect upon the human sacrifice that all sides made defending what they believed was right, and reflect on cultural changes that have occurred since the battle. Many visitors, Tribes, and stakeholders have commented over and over that the ability to hear the natural sounds, listen to the wind blowing, and hear the sound of the Meadowlark is a fundamental part of the Little Bighorn Battlefield experience. LU-2

Increases in ambient noise levels, low level startle effects and sonic booms would all impact the visitor experience and natural soundscapes of the site, and would impact visitors' ability to enjoy the contemplative and sacred atmosphere that is so fundamental to Little Bighorn Battlefield. Being startled by a sonic boom while standing alone on Last Stand Hill, contemplating the sacrifice of the U.S. Army and the Cheyenne and Lakota, would have a serious impact on the visitor experience and that person's ability to imagine what it was like to be on that same hill in 1876. All three types of noise would likely impact NPS operational and educational activities such as the outdoor ranger programs (guided walks and outdoor ranger talks) that take place 10 times a day between May and October and that over 60,000 visitors each year enjoy. LU-2

In addition, the increases in ambient noise levels, low-level startle effects, and sonic booms would also impact the family members and loved ones who come to pay their respects to the over 5,000 veterans and dependents who are buried at the National Cemetery. Increased noise would also significantly disrupt the solemn and reflective atmosphere for the 10 to 15 funerals that are still conducted annually at the National Cemetery. The release of chaff or flares over the battlefield also has the possibility of visual impact to all of the visitor experiences during these and other services, as well as during operational activities and the special activities listed above. Fallen chaff and flare remnants would also have the potential to litter the battlefield, disrupting the historic scene. LU-9

Additionally, the National Monument issues approximately 25 special use permits per year for activities such as Tribal religious or cultural ceremonies, commemorative events by military and non-military groups, and commercial filming. Increases in ambient noise levels, low level startle effects, and sonic booms would significantly disrupt these activities. As described in the EIS, "Native Americans from the four directly impacted reservations explained that low-level overflights and intrusive noise would be detrimental to their cultural practices." These types of cultural practices, highly significant to Tribal members from 17 reservations throughout the region occur not only on reservations but at sites such as Little Bighorn Battlefield. We suggest further consultation with the Lakota, Dakota, Nakota, Cheyenne, Arapaho, Arikara, and Crow Tribes about how low level overflights might impact their cultural practices, ceremonial practices and offerings at Little Bighorn Battlefield National Monument. NA-4

Cultural Resources

The EIS notes the possibility of sonic booms causing the failure of glass, plaster or other structural elements. Little Bighorn Battlefield is home to many irreplaceable cultural resources, including historic monuments and structures. The two-story stone lodge constructed in 1894 as the Superintendent's residence is said to be one of the first permanent dwellings in Eastern Montana. Thanks to preservation work and good care, it retains its historical and architectural integrity and is in good condition. However, it would be unacceptable if sonic booms caused the failure of its historic glass windows and/or doors, or plaster, or disturbed its stone foundation or exterior walls. Other historic structures at the Battlefield that must be protected from sonic booms include the Fort C.F. Smith Memorial (circa 1868), quarried from local limestone and the 1881 7th Cavalry granite memorial on Last Stand Hill, both of which are part NO-2

of Historic District One; and the Reno-Benteen granite memorial (circa 1928), located in Historic District Two.

The EIS also notes the possibility of sonic booms causing "...bric-a-brac balanced on shelf edges such as mantles or bookcases to be vibrated off and fall and break." It should be of note that the National Monument's priceless museum collection and rare book collection is stored onsite. The museum collection includes over 119,000 objects, many of which are fragile and sensitive, and many of which are on display in the museum gallery of the Visitor Center. If sonic booms were to cause exhibit or museum collection items to fall or break, or for windows or glass exhibit cases to break, it would have serious unacceptable resource protection, security, and safety impacts. NO-2

The EIS also notes the possibility for future threat emitters on 15 acre sites, which would be subject to further environmental review (ES-30). In the future we would like to be notified if any threat emitters are proposed in the historic viewshed of the National Monument, which includes adjacent lands pertaining to the Battle of the Little Bighorn, as these would have an adverse effect on the cultural landscape/historic viewshed. CM-2

Natural Resources

The EIS states: "Flares burn out in approximately 500 vertical feet, or a minimum of 1,500 feet above the ground. There would be a very slight potential for increased fire risk if flares were accidentally deployed substantially below authorized altitudes." The National Monument's prairie grass ecosystem and riparian zone has a very high fire danger from over nine years of prolonged drought, especially between July and September, and use of chaff and flares should be restricted over the National Monument and adjacent lands. We also recommend that local Bureau of Indian Affairs, Big Horn County, and area fire departments be involved in training and fire protection from chaff and flares. SA-5 AM-24 DO-2 SA-13

One of the NPS primary missions is to preserve natural resources unimpaired. Baseline data about wildlife species at the National Monument is incomplete. However, we are concerned about the potential for low level flights to impact all types of wildlife species with increased ambient noise, startle-effect, and sonic booms. The National Monument has several species of concern, including Sage Grouse, wild Turkey, and several nesting sites for Canadian Geese, Great Blue Herons, and other water fowl in the riparian zone along the Little Bighorn River in the Custer Battlefield sector. These species may be adversely affected by low level overflights and noise including sonic booms and jet engines. BI-9 BI-4

Specific Comments

Please provide a citation for footnote 2 in Table 3.2-3 (Average Frequency of Military Aircraft Noise Events at Selected Noise-Sensitive Locations), that states the Devils Tower National Monument published aircraft avoidance area is 5 nautical miles (NM) horizontally and 18,000 feet AGL. The notice on the Billings Sectional Aeronautical Chart, dated 26 August 2010, states "...for reasons of national welfare pilots are requested to avoid flights within 3 NM of Devils Tower National Monument." AM-24

Ms. Linda Devine 7

CONCLUSIONS

Based on information provided in the DEIS, the USFWS determines that the relative impacts of the DEIS alternatives on fish and wildlife resources would be as follows:

Alternative A. This alternative would likely have the largest potential impact to federally listed as threatened and endangered and on migratory birds, because it increases the level of disturbance to the Greater sage-grouse in all four states, and to Sprague's pipit. BI-8

Alternative B. This alternative would likely have the least impact to the Greater sage grouse in Wyoming and Montana. DO-2

Alternative C. This alternative would have the least impact to endangered whooping cranes and other migratory birds that use the principal migrational routes of the central and Mississippi flyways. DO-5

No Action Alternative. This alternative would have the least impact on federally listed species since there would be little to no increase in the current activities. GE-2

The NPS is quite concerned with the proposed action and its potential to affect visitor experience, natural soundscapes, cultural resources, and sacred sites at the National Monument. Our first preference would be the No Action alternative, although we realize this may not be feasible given your purpose and mission. We note that Alternative B would have had no low-level flights over the National Monument (in addition to other culturally sensitive areas). We would strongly support either a reconsideration of this Alternative or the modification of the preferred alternative to include expansion of the avoidance distance to include the National Monument to reduce or eliminate the noise and visual impacts of low level military aircraft. The avoidance measure listed is the standard for all aircraft; however, military aircraft are substantially louder than general aviation aircraft. An avoidance distance similar to the one charted for Devils Tower National Monument would be acceptable. GE-2 DO-2 AM-24

The Department has a continuing interest in working with the Air Force to ensure impacts to resources of concern to the Department are adequately addressed. If you have questions regarding Fish and Wildlife Resources comments, please contact Mr. Scott Larson, Field Supervisor of the U.S. Fish and Wildlife Service' Ecological Services Field Office, in Pierre, South Dakota, at telephone (605) 224-8693. For issues concerning National Park Resources comments, please contact Regional Environmental Coordinator Nick Chevance, Midwest GE-11

Re: Powder River MOA Proposed Expansion

Ms. LeVine:

My name is Ray A. Jilek, president of Eagle Aviation, Inc., the Fixed Base Operator at Black Hills Airport in Spearfish, SD and I am also the Airport Manager. I had previously attended your "Scoping" meeting in Belle Fourche, SD June of 2008 and Public hearings in both Rapid City and again Belle Fourche September 14th & 15th.

We are very concerned with the MOA proposal as presented and detailed in the Environmental Impact Statement. The following "Bullet" points are some of the primary issues with which we have concerns that have not been fully addressed to this point:

- Black Hills Airport ranks #5 of 34 public use airports within your study area for annual operations and is **not even shown** on your maps.
- During the time your data was compiled Black Hills Airport's primary runway was closed for lengthening and re-construction with a total investment of approximately 10 million dollars.
- We are currently moving forward with a full-length parallel taxiway project with a price tag of approximately 7 million dollars.
- Due to our recent expansion we are in the process of developing new LPV approaches to runway 13/31 for category A, B, & C aircraft. IFR capabilities throughout this construction period have been curtailed or significantly reduced.

AM-4

Eagle Aviation at Black Hills Airport
605-642-4112 • Fax 605-642-1838
Cessna
300 Aviation Place, Spearfish, SD 57783
eagle@mato.com • eagleaviaitoninc.com

3061

- Expanding the MOA to an area of 37,800 Sq. Mi. (Larger than the state of Indiana) will have a **dramatic effect** on air travel to and from the Black Hills Region. AM-6
- IFR traffic to or from any area north of the Black Hills will be **significantly impacted** and may very well chose an **alternate destination** even though the Black Hills region is the most popular destination for recreation / tourism within hundreds of miles. SO-5
- VFR "See and Avoid" as proposed in your document is an incredible increased risk to flight safety assuming one was able to conduct flight under VFR conditions considering a closure rate of **800 plus knots**. (B-1 pilot stated 580 kt. Airspeed as normal within the MOA) SA-7
- FAR 91.117 requires a civilian pilot to reduce speed to below 250Kts. Anytime one is bellow 10,000 ft. to provide an opportunity to "See and Avoid" (Max. potential closure rate **of 500 Kts.)**
- Exemption #7960C authorizes the USAF to operate in the Powder River MOA "**Lights-Out**" at night to practice night vision goggle usage and yet we are told to feel safe flying through the MOA after dark VFR **"See and Avoid"?** SA-11
- As stated in your EIS, Radar coverage is **unavailable below 8000 ft.** which will provide no help for a VFR flight through the MOA. AM-3
- With the proposed MOA extending from 500 ft. AGL up to 60,000 ft. it will be **impossible for IFR** traffic to transition through this area when the MOA is active Mon. through Fri. 6:00 AM till Noon and again Mon. through Thurs. from 6:00 PM till 11:30 PM or other times when activated by NOTAM. AM-21
- The three corridors along Victor airways would allow IFR traffic through, below 18,000' except during Large Force Exercises. These corridors do **little to mitigate** the impacts to the Black Hills and most IFR traffic would generally fly above 18,000' due to weather as well as operating efficiency.
- Restrictions on IFR traffic through the MOA would not only have **significant economic impact** to our customers, but also to all commercial airline traffic that traditionally flies over this area as they are incapable of flying above 60,000'. SO-7
- Your EIS does nothing to address **the economic impact** of this proposal other than stating a "Potential Economic Impact" to General Aviation. SO-22
- Approximately 80% of our fuel sales are to Transient aircraft. If the MOA were to be expanded as proposed, one could reasonably expect a **significant reduction** in fuel sales which contribute to the employment of our existing employees as well as a significant reduction in the collection of "**Flowage Fees**" collected for Lawrence County to help offset the operational costs of this Public-Use Airport. SO-10

In addition to the above concerns, I have issues with the proposed activities planned for this expanded MOA. Specifically, the concept of VFR "See and Avoid" in an area with B-1's, B52's, F-16's, etc. operating at speeds exceeding 500 kts. Without radar coverage and possibly with their lights off is dangerous, reckless and foolish like a ticking time bomb. Should this proposal move forward, please consider adding layers that would allow through traffic such as 8,000 – 12,000 msl and 16,000 – 24,000 MSL to allow transitioning aircraft through MOA and improvements to radar and radio coverage. Proposed SA-7 AM-26

3061

activities such as supersonic flight, live flares, defensive chaff, Lights-out NVG training, closure rates far exceeding what is acceptable to the FAA for civilian operations, lack of radar and radio coverage throughout the area, etc. I'm convinced that these are technically operations which should be conducted in Restricted Airspace not in a MOA. The last issue of concern is the complete lack of any effort to identify or quantify the significant economic impacts of the proposal to the entire region.

AM-11
SO-22

Sincerely:

Ray A. Jilek, Airport Manager

Black Hills Airport / Clyde Ice Field

Ref: EPR-N

ATTN: Ms. Linda A. DeVine
HQ ACC/A7PS (PRTC EIS)
129 Andrews Street, Suite 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine:

Re: Powder River Training Complex DEIS
CEQ# 20102947

In accordance with our responsibilities and authorities under the National Environmental Policy Act (NEPA), and Section 309 of the Clean Air Act, the Region 8 office of the U.S. Environmental Protection Agency (EPA) has reviewed and is providing a CEQ rating for the Draft Environmental Impact Statement (DEIS) for the proposed Powder River Training Complex (PRTC).

The purpose for the DEIS is to analyze the environmental effects of designating additional airspace in Wyoming, Montana, North Dakota, and South Dakota, adjacent to Ellsworth AFB, that would provide military aircrew training opportunities that cannot be accomplished in the existing Powder River military operations area (MOA). Alternative A, the Air Force Proposed Action, would expand and enhance the existing Powder River airspace to become the PRTC. The enhanced airspace would provide realistic, integrated B-1 bomber training close to Ellsworth AFB to maximize training in local airspace and minimize long-distance commute time to remote training ranges. The expanded training complex would also support continued and enhanced B-52 training for aircraft from Minot AFB. Alternative A is based on B-1 and B-52 training needs, which in turn dictate the airspace structure and number and type of airspace operations that occur within the proposed PRTC airspace units. The FAA and the USAF identified the no action and two additional action alternatives to the proposed alternative after several public hearings to obtain input from the public and other stakeholders. We defer to the FAA, which has jurisdiction by law or special expertise for administering all navigable airspace in the public interest of safety.

The DEIS documents the process that analyzed impacts identified during the scoping hearings. We reviewed a summary of the issues raised during those hearings and were satisfied with the public involvement process required by NEPA. Environmental impacts were assessed and mitigation measures were designed to address the following relevant planning issues organized into the applicable resource categories of interest:

- Regional energy development projects including tall wind turbine towers
- Civil/commercial aircraft flight operation compatibility

3062

- Access to local general aviation airports
- Destructive ground effects of sonic booms from military aircraft
- Chaff and flare deposition under severe wildland fire conditions

In general, the DEIS is well organized and thorough in its analysis of impacts. It also clearly demonstrates where impacts from the proposed alternative may be significant. However, EPA was disappointed in the decision to screen several alternatives that were considered but not carried forward into detailed analysis. An increase in funding for commuting (§2.3.3.2), use of flight simulators (§2.3.3.3), and relocation of basing for the training aircraft (§2.3.3.4) were considered but not very well explained before dismissal from detailed analysis. We believe the public would be better served by providing them a better understanding of the increased funding required for longer flight commutes to remote military training airspace. Also the limited discussion on expanding the use of flight simulators seems to underestimate the public perception that simulation technology available to the military is highly sophisticated and capable of integrating the entire Air Force team and obtaining aircrew combat mission readiness. The Final EIS should discuss how the Base Realignment and Closure (BRAC) Commission voted to retain Ellsworth AFB for continuing to base a B-1 fleet without, at the same time or within the BRAC analysis, determining whether the existing airspace could meet the change in military training requirements for these multi-mission aircraft.

DO-6

PN-7

GE-16

The DEIS discusses the proposed management practices that would be used to control the risk of wildland fires initiated from the use of flares within the PRTC (§2.4.6.2). The Air Force proposes to discontinue release of flares in an MOA when fire danger is rated "extreme" under the National Fire Danger Rating System (System) provided by the United State Forest Service Wildland Fire Assessment System. However the "extreme" classification under this System identifies conditions where fires start quickly, spread furiously and burn intensely. All fires in this condition are potentially serious because fire development into high intensity burning will usually be faster and occur from smaller fires than in the very high fire danger class. EPA suggests that a more conservative management approach be adopted within the PRTC so that release of flares is not authorized whenever the System rates the fire danger as "moderate" or higher (i.e. high, very high, or extreme). The System classifies "moderate" fire danger as those conditions when fires can start from most accidental causes, but with the exception of lightning fires in some areas, the number of starts is generally low. Fires in open, mature grasslands will burn briskly and spread rapidly on windy days. EPA recommends that the Final EIS provide information on how often the System rated fire danger moderate or higher in the proposed PRTC during the last major drought year (2002). This historical comparison would give the reader some idea of how often adverse fire conditions would not permit use of flares.

SA-5

EPA evaluated the potential effects of the proposed action and the adequacy of information in the Draft EIS. EPA rates this proposal to establish the Powder River Training Complex with a Lack of Objection ("LO") under our rating criteria. The "LO" rating means that our review has resulted in finding no environmental impacts that have not been effectively mitigated in the proposed alternative. We are raising no objections to the proposed action.

2

3062

We appreciate the opportunity to provide comments at this stage of the project. If you have any questions or would like to discuss our rating, please contact me (303 312-6004) or James Hanley (303) 312-6725 of my staff.

Essential Air Service Task Force
643 Remuda Creek Road
Fort Peck MT 59223
(406) 525-3318

November 10, 2010

Ms. Linda Devine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Subject: Draft Environmental Impact State for Powder River Training Complex

Dear Ms. Devine:

The Montana Essential Air Service Task Force consists of representatives from Montana's seven eastern essential air service communities located in; Sidney, Glendive, Miles City, Glasgow, Wolf Point, Lewistown and Havre.

The task force opposes the expansion of the Powder River Training Complex into Montana. The proposal and charted times of use are extreme and unsupported and the colossal level of this proposal will have devastating impacts on southeast Montana. GE-2 AM-6

Any disruption in air service to these communities is unacceptable. These scheduled flights are in most cases the only form of public transportation available. Essential Air Service plays a key role in local communities by attracting and retaining businesses that depend on commercial air service, in health care by enabling our citizens to easily access sophisticated healthcare that is often absent in rural communities. SO-5

Great Lakes Airline provides this service with flights originating from Denver. When the MOA is active, Great Lakes will be forced to divert and fly through the proposed gaps. During a Large Force Exercise, the carrier will be re-routed and made to fly around this large mass of airspace. SO-6

Adding additional time and expense to any air carrier or general aviation operator is not acceptable. In these volatile economic times and current state of the aviation industry, I urge you to adopt the "no action alternative" and do not interrupt our commercial or general aviation activities. SO-7 GE-2

The task force values and appreciates our United States military forces. We thank you for your service to this great country.

Sincerely,

John Rabenberg
Chairman

Ms. Linda DeVine
HQ ACC/A7PS
129 Andres Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine,

I am writing to express my concerns over the expansion of the Powder River Training Complex (PRTC). I have four major concerns. The first is the expense burden on business and private aviation, the second is destination aviation and the loss of revenue in the Black Hills, third is the impact on ranching and the loss gains therefore the loss of revenue, and the fourth is safety.

Our business and private aviation will be affected because of several different reasons. The expansion of the PRTC will increase operating costs immensely because of restricted flight schedules as well as the added flight costs and wages for Lantis Enterprises, Inc. The increases can be figured at an added $680 in flight costs as well as an extra $350 in wages for employees per flight if we would be required to fly around the PRTC. This would be detrimental to our company as we need to make regular flights to check on our facilities and businesses; we are literally estimating costs just for our company in excess of $100,000.00 a year. This would not include the cost of being grounded for several hours while waiting for the flight exercises to be completed so that we could take off or land. To expect businesses and individuals to reschedule their lives, business, and flight plans around the PRCT flight exercises is not an option.

SO-7

SO-8

Private aviation would be negatively impacted through all of the public and private use airports in the region. During PRCT flight exercises, small airports would see a drastic reduction in the amount of traffic in an out of their facility. These flight exercises would even cause a permanent reduction in business, business which is vital not only for the airport, but the surrounding community. For example, the local airport here in Spearfish, based on the numbers gathered by the PRTC is rated fifth highest for activity in the region, even though those numbers were gathered during a reconstruction period, of which over a month of the data collection information the airport was completely closed. If they were to lose any

SO-10

3064

business, either temporarily or permanently, this would cause significant damage to current business relations as well as future relations. SO-10

I believe that this would cause destination aviation in the Black Hills area to decrease. Tourism is a big part of the viability of the Black Hills. If the PRTC expansion did take place I believe that this would have a large economic impact on this area. SO-9

Another concern that I have is for the ranching business. My family owns a large ranch with various numbers of livestock in northwest South Dakota. The problems that would be caused by the low flying aircraft and other exercises would be sizeable. This would cause stress on the livestock, resulting in low weights, increased veterinary bills, increased cost for fencing repairs and the loss of livestock. It would also be difficult to attempt to coordinate events such as moving livestock or branding around the PRTC schedule with any amount of efficiency. The expansion of the PRTC into this area would cause the resale value of our ranching operation to decrease. All of these combined concerns regarding our family ranch would have large economic ramifications on that facet of our business. SO-13

There are many safety concerns that need to be considered regarding the PRTC. Civilian pilots operating under Visual Flight Rules (VFR) have addressed that flight, with the current size of the PRTC, is already a risk to fly through. The combination of the expansion of the area to the proposed size, the lack of suitable and reliable surveillance radar and radio communications at low altitudes, and the high speed of the Bomber and other aircraft involved would take an already risky situation and escalate it to a dangerous situation. AM-3 SA-7

The expansion of the PRTC to the proposed areas will add a considerable amount of grassland to the project, and while they will practice using chaff and flares at such a low altitude there is a heightened probability that these could come into contact with another aircraft. Furthermore this practice could cause a major fire in some rural areas. This is a major problem, as the rural areas all have volunteer firefighters and it can take some time for them to arrive on scene. With the hot dry summers that we have in this area, one ember from a flare could very quickly engulf the entire acreage of a ranch or farm. This one exercise alone could cause the loss of crops, livestock and possibly a home and ranch buildings. SA-26 SA-5

According to the Air Force, the sound of a Bomber has been used as a weapon in combat, described as a "show of force," and is deafening to the human ear. The level at which hearing loss begins is 90-95 decibels, with physical pain beginning at 125 decibels. A Bomber with afterburners emits 133 decibels at 2000 feet above ground level (AGL). This is louder than a rock concert. This doesn't take into effect the sonic booms that will be occurring and the affect that they will have as well. Stated indoor levels of 113 decibels as well as the supersonic flight could also cause damages to people's homes and possessions. Who will pay for the damages caused every time a supersonic flight breaks a window in someone's home or even in their vehicle? These are all problems that need to be very carefully considered, especially the repeated flights at a decibel that can cause hearing loss. NO-5 SO-12 NO-11

3064

Two suggestions that I would like to make regarding the expansion of the PRTC are to allow two elevation gaps for flights and to expand and improve radar surveillance and radio communications. My proposal would be to allow for two separate elevations from the surface to 5,000 feet AGL and from 26,000-34,000 feet MSL that would be open at all times for private, business and commercial flights to have access to, with radio and radar coverage. This would allow flights for both entities to continue at all times and would alleviate the extra costs that would arise instead of having flights grounded during these exercises. This proposed plan would not cripple the public and private use airports. This would be a compromise on both parts and would satisfy the need for flight time for the USAF and for the private, business and commercial aviation. AM-26

If the expansion was to occur before that could happen there would need to be some major improvements in radar surveillance and radio communications. This should be an essential requirement for a project of this size because of the increase in air traffic. AM-3

I believe that all of the noted problems and improvements need to be carefully considered and a very in-depth economic impact study needs to be conducted and information compiled. If a project of this size is not handled appropriately and the studies are not done correctly ahead of time, major damages would be caused and several people would be very disgruntled when it comes to the USAF, our troops need our support not a fight with the public it's very existence is to protect. SO-22

With all of the problems, concerns, and work that should be addressed, I believe that we are nowhere close to where this project should be approved. If you have any questions, please do not hesitate to contact me.

MAMA

Montana Airport Managers Association

November 15, 2010

Ms. Linda DeVine
HQ/ACC/A7PP
129 Andrews Street, Room 317
Langley AFB VA 23665-2769

Dear Ms. DeVine:

The Montana Airport Manager Association (MAMA) represents the interests of Montana's airports, both large and small. The proposed expansion of the Powder River MOA is an issue that causes many members of MAMA much concern. The area of eastern and south eastern Montana being considered in the proposed expansion of the Powder River MOA significantly increases the impact to Montana airspace without any economic benefit to this area of Montana. In fact this expansion will add to an already difficult economic condition in this part of the State. The Air Force bases in North Dakota and South Dakota provide a very large economic impact to those States and subsequently should be willing to shoulder the burden of an expanded MOA in their respective States, as opposed to a large expansion into neighboring Montana. SO-24

In recent years south eastern Montana has began to see an increase in general aviation activity as the result of the exploration of Montana's natural resources. This activity has fueled local economies through the sale of fuel, overnight parking, hotel accommodations, use of restaurants, and rental car sales. IFR aircraft would be significantly restricted in the use of the air space over these areas and subsequently could result in a loss of revenue to these communities. Any loss of revenue will impact the ability for these communities to maintain their airports and provide a safe airport environment. Many local residents depend on aerial applicators to spray fields at low altitudes, additionally many local ranchers who pilot aircraft will fly at low altitudes to check on livestock spread out over many square miles. The ability for these activities to safely perform a necessary function is greatly diminished with an expansion of the Powder River MOA. It does not appear that there will be a method to provide for safe separation of military and civilian aircraft due to limited or non-existent radar and voice communication. SO-9, SA-9, AM-3

The aviation industry has taken some hard lumps over the past few years and requiring aircraft to circumvent this expanded area will only serve to increase the cost of operating an aircraft in the vicinity of the Powder River due to the need to use additional fuel, which the price is steadily increasing on. This impact could be especially difficult on the Essential Air Service (EAS) provider that currently serves seven (7) cities in eastern Montana that are near the propose Powder River MOA and may need to deviate many miles on many of its flight routes, adding additional costs to a very revenue lean operation. SO-7

Billings Logan International Airport – 1901 Terminal Circe – Room 216 – Billings, MT 59105 406-657-8484

3065

While MAMA and its members whole heartedly supports all branches of the U.S. military, and all agree that training is important, we believe that with the expansion of the Powder River MOA, the airports of eastern and south eastern Montana and their supporting communities are being asked to provide more than their fair share in helping the military in their training needs. GE-3

Sincerely,

Kevin Ploehn
President
Montana Airport Managers Association

Langley AFB, VA 23665-2769

Dear Ms. Devine,

As President of the Montana Pilots Association which was founded in 1939 and represents approximately seven hundred members, I was requested to send this letter of comment, after a unanimous vote by the board of directors. We are not in favor of any expansion to the Powder River Military Operations Area. Several Montana Pilots Association members, including myself, state officials, eastern Montana county officials, ranchers, and numerous other concerned parties attended a meeting September 7th 2010 in Billings, Montana. The meeting was arranged by Congressman Denny Rehberg's staff member, J.T. Korkow, with Colonel Jeffrey B. Taliaferro, Wing Commander Ellsworth Air Force Base, Rapid City, South Dakota and his staff. I also attended the public hearing meeting in Billings, Montana. The Montana Pilots Association has come to the conclusion the negative economic hardships to the aviation community in the State of Montana are not acceptable. We are in agreement with our elected officials: Senator Max Baucus, Senator John Tester and the State of Montana, whom have all voiced the negative impact this proposal will have on our State. Jim Lynch, Director of the Montana Department of Transportation and Debbie Alke, Administrator of the Aeronautics Division, Department of Transportation, have also made numerous negative comments to this proposal.

It was quite evident the majority of folks that made comment at the Billings public hearing were not in favor for many reasons, including concerns over negative economic impacts to commercial and private aviation operations, safety issues such as spooking of domestic animals, wildlife stress, and Post Traumatic Stress victims from previous military conflicts. The list of opposition is long and varied.

So with all due respect please mark our comment down as No-Action Alternative, which is no change to the current Powder River Military Operations Area.

GE-2

Sincerely,

Wade Cebulski

Wade Cebulski, President

NDBAA Response to the EIS for the Powder River MOA Expansion Request

North Dakota Business Aviation Association (NDBAA) represents commercial and corporate pilots, FBO's, SASO's and anyone that incorporates aviation in to their business operations. Our Mission is to promote the interests of those that benefit from the use of business aviation in North Dakota

The proposal for the expansion of the Powder River MOA by the US Air Force has no foreseeable value to the professional and corporate air traveler. As it is proposed, it will only cause delays and add expense to those traveling into and out of western North Dakota. It will also delay and even deter many flights that would have crossed over and stopped in North Dakota to seek a different alternative stop.] SO-8

For those that satellite out if the Bismarck/Mandan area with medical and legal services to the smaller rural communities, it will cause unpredictable delays in those travels. In some cases it will cause complete cancellation of services to the smaller communities.] SO-5

Delays to critical care flights are proposed to be minimal however when these flights are most needed any delay can mean the difference between life and death.] SA-19

Respectfully submitted,

Jonathan P. Simmers

Secretary

ND SHPO 08-0893 USAF Powder River Training Complex - low flying training missions B-52s and B-1s in Southwestern North Dakota

Dear Ms. DeVine,

We received your initial consultation materials regarding ND SHPO 08-0893 USAF Powder River Training Complex low flying training missions B-52s and B-1s in Southwestern North Dakota. We request more detailed maps to understand better which aircraft would be flying in which corridors in North Dakota. Other comments include:

- There is one newly listed National Register Property in the APE: Evangelisch Lutheraner Dreienigkeit Gemeinde (Church) Grant County, City of New Leipzig. CU-2
- We have concerns regarding fragile historic earthen-based homes and outbuildings in the area. Many of these have earthen walls or stone walls with mud plasters that could be damaged or destroyed easily by vibrations. Stern Homestead is an example, and there are several others that are eligible for but not listed in the National Register of Historic Places. NO-2
- We have concerns regarding low flying aircraft and disturbances to the tranquility of the prominent buttes in the area, such as Sentinel Butte. LU-2

We look forward to further review information and consultation. If you have any questions please contact Susan Quinnell, Review and Compliance Coordinator at (701) 328-3576, squinnell@nd.gov.

Sincerely,

Merlan E. Paaverud, Jr.

RE: Powder River Training Complex expansion

Dear Ms. DeVine:

We, the board of County Commissioners of Powder River County, Montana, would like to express our concerns about the expansion of the Powder River Training Complex.

First: With a floor of 500 feet, our area has no radar below 15,000 feet. We feel if you do this, a system should be in so Salt Lake can see all the activity that is here. This would include landing and take offs from the Broadus Airport and our local rancher's private air strips. AM-3

Second: This complex should not limit any of our natural resource development. We feel this is very important because of the economic development this would bring to our area. Along with this, if the 9 am to 2 am flight times are obeyed, then energy company's corporate planes could work with that. Also, the farmers and ranchers in the area could adjust to those times. SO-17

Third: We feel Elsworth Air Force Base should plan annual meetings in our area to meet with the local residents. A face to face meeting would provide opportunity for interaction between local residents and Air Force personnel. That way we see them and they see us, face to face. Sometimes things look good on paper, but reality is sometimes different. This would give the Air Force a chance to listen to local concerns. It would also give the local residents a chance to meet and listen to Air Force concerns. GE-5

Fourth: There must be written protocol for operation of firefighting, and life flight aircraft. Operations of aircraft in this capacity may range from several hours to several days. Crop dusters and aircraft involved in predator control have a limited window of opportunity to perform their tasks. Protocol must be included that does not restrict the use of this type of aircraft, which could affect our local economy. SA-19 SO-12 SO-15 SO-2

3070

Fifth: We do depend on recreationalists who come to our area to get away from noise and debris. Every effort can and must be made to minimize the effect low flying aircrafts would have on this type of economic industry in our county. SO-9

Powder River County Board of Commissioners are interested in how you address concerns related to this proposal.

Sincerely,

BOARD OF COUNTY COMMISSIONERS
POWDER RIVER COUNTY

Roy Traub, Chairman

Don McDowell

Les Thompson

RE: Powder River Training Complex Draft EIS

Dear Ms. DeVine,

The Standing Rock Sioux Tribe (Tribe) appreciates the opportunity to comment on the Powder River Training Complex Ellsworth Air Force Base, South Dakota Draft Environmental Impact Statement (DEIS) and it environmental impacts to the Standing Rock Indian Reservation (Reservation).

Before we begin our comments on the DEIS, the Standing Rock Sioux Tribe is very supportive of the U.S. military and its efforts to protect and serve our country. Many of our tribal members are proud to have served in the Armed Forces. GE-9

In the DEIS, we request that you use "Standing Rock Indian Reservation" when referring to our Reservation and "Standing Rock Sioux Tribe" when referring to our Tribe.

We were notified of this project two years ago when people from Ellsworth Air Force Base visited the Reservation and gave a presentation. At that time, we were told by several different military personnel that the flights over the Reservation would be infrequent, even nonexistent. The few flights that would take place would be at a very high altitude. However, in the recently released DEIS, it appears that there are plans to fly at altitudes of 500 ft. over our Reservation, contrary to what we were led to believe. The information provided by military personnel to the Tribe directly contradicts the proposed DEIS. If what we were told two years ago by Army personnel is correct, it should be included in the DEIS. PN-5 PN-4

Our people are deeply concerned about low-level flights and sonic booms that would occur over our Reservation, especially during the summer months. Many tribal members practice traditional religious ceremonies outdoors in the summer on tribal lands. Aircraft flying at low-levels and/ or sonic booms would be not only disruptive and intrusive but also highly disrespectful to our spiritual and religious practices. NA-4

BLDG 1 NORTH STANDING ROCK AVE. P.O BOX D • FORT YATES, NORTH DAKOTA 58538
PHONE: 701-854-7201 or 701-854-8500 • FAX 701-854-7299

3071

Ms. Linda DeVine
Powder River Training Complex Draft EIS
Page 2

Our religious practices take place outdoors and can occur anywhere on Tribal lands within the reservation boundaries, both day and night.

Also, many of our tribal members are also cattle ranchers and sonic booms and low-flying aircraft would be disruptive to their ranching activities such as calving, branding, weaning or other penning operations. BI-4

For these reasons, we are requesting that the entire Standing Rock Indian Reservation be made an avoidance area and that there be no low-level aircraft or sonic booms over tribal lands during the months of June, July and August. Please find attached a map of all tribal lands within the exterior boundaries of the Standing Rock Indian Reservation NA-5

Please be reminded that "Federal agencies shall protect and preserve Native American religious cultural rights and practices". [*See,* American Indian Religious Freedom Act, 42 U.S.C. §1996 (1978), et. seq.] In this case, we interpret that to mean that the U.S. Army will refrain from low-level flight and sonic booms during the summer months when tribal members are practicing their traditional and religious ceremonies.

Moreover, many of our tribal members are concerned about the dispersion of chaff over the Reservation. Although the DEIS claims that the chaff will likely disperse before reaching the ground and that there is little harm, we request that the military limit the use of chaff over the Reservation and start using new technologies available that create invisibility. NA-6

Our tribal members are also concerned about the potential of a lit flare reaching the ground and causing a fire. While there is a small chance this may occur, we would like the Air Force to assume full liability for all damages including the cost of fighting range fires started by flares. SA-5

We are disappointed in the brief history of Native Americans that is portrayed in the DEIS on pages 3-109 to 3-113. Not only are there misspellings but also factually incorrect information. We offer the following corrections for inclusion in the DEIS. NA-12

Page 3-109, second paragraph
Change the word legend to history.
Change semi-woodland to woodland
The last sentence uses the date mid-1800s, change to mid-1700s.

Page 3-110
The third paragraph starts with "The Treaty of Fort Laramie". Please note that you are referring to the second Treaty of Fort Laramie of 1868. The first Treaty of Fort Laramie was in 1851.

Powder River Training Complex Draft EIS
Page 3

Also in this paragraph, Yanktonai is misspelled

We ask for a rewrite of the fourth paragraph. The sentence "Conflict was exacerbated by the Black Hills gold rush" is a polite way of saying that the Fort Laramie Treaty was repeatedly violated by white settlers in search of gold. Please include language that states the Black Hills are sacred to the Dakota and Lakota, and were illegally taken from the Lakota and Dakota by the U.S Government. To this day, the Dakota and Lakota people refuse to accept money for their sacred Black Hills (Paha Sapa) and continue to fight legally. We object to the following language, "Mining and other intrusions in to the Great Sioux Nation created tension..." Mining in the Black Hills was a direct violation of the 1868 Fort Laramie Treaty.

NA-12

Page 3-112
The last sentence in the first paragraph refers to the "battle" at Wounded Knee. This was not a battle but a massacre. All weapons were taken from the Dakota and Lakota and they were surrounded by the 7th Calvary. In less than one (1) hour, 350 Lakota men, women and children were slaughtered at the hands of the U.S. Government.

Page 3-112
In the third paragraph the first sentence is incorrect. The five reservations, including Standing Rock, were created by the Act of March 2, 1889, not the Dawes Act.

We hope that you are able to incorporate these changes into your historical section. We believe it is important that you provide an accurate account of history.

If you have any questions, please call my office at 701-8524.

Respectfully Submitted,

Charles W. Murphy, Chairman

RE: Powder River Training Complex
Ellsworth Air Force Base, SD
Draft Environmental Impact Statement

Dear Ms. DeVine,

The Standing Rock Sioux Tribe appreciates the opportunity to review the Powder River Training Complex Draft Environmental Impact Statement (DEIS).

Due to the many complex issues presented in the DEIS and the variety of concerns from our tribal members, we would like request a 30-day extension on the comment period.] NP-5

Should you have any questions please contact Adrienne Swallow, Environmental Protection Specialist at 701-854-8582 or aswallow@standingrock.org.

Sincerely,

Charles W. Murphy

3073

Dear Madam:

Comments regarding the public hearing for the Proposed Powder River Training Complex held in Gillette, Wyoming October 18, 2010

I represent the True Companies from Casper, Wyoming. We are in the oil and gas drilling and production business, pipeline, trucking, and oil field supply business. We travel to North Dakota and eastern Montana on company airplanes on a regular basis. This proposal creates a three hundred mile obstacle between Casper and Gillette, and our destinations in North Dakota (Williston, Watford City, Stanley, Minot, Dickinson, Bismarck,) and Montana (Ekalaka, Baker, Glendive, Sidney.) The proposed Powder River Training Complex extends from Billings, Montana to Bismarck, North Dakota. For us to get to each of these destinations except Bismarck, avoiding the entire Complex will add at least two hundred miles (45 minutes to an hour depending on the airplane used) for each round trip. We often pickup and or drop off employees in Gillette to be taken to, and returned from, North Dakota. While the distance from Gillette to Dickinson, North Dakota is 200 miles, when the complex is active, we will have to fly to Dickinson via Bismarck adding 200 miles to each leg and will cost us an extra 400 miles (1.5 to 2.2 hours depending on the airplane used) for each round trip. In addition to the time and expense impact, the weight of the fuel to fly the extra 100 miles each way is the same as a passenger, so we will also be losing utilization. In the two weeks prior to the public meeting in Gillette we went to Bismarck twice, Minot, Stanley, Watford City, and Williston. Your proposed schedules are, and have been, about the same as our schedules. The phrase " and other times by NOTAM " implies that this 300 mile wide obstacle will active more and more often.

SO-7

There are many other users of this area in the energy business who aren't even aware of this airspace grab. I've not seen anything in the AOPA magazine, Business and Commercial Aviation, or any other trade publications. Is this an oversight? I think you need to expand your public awareness.

3073

The Air Force briefers at the public meeting are no doubt briefing us in good faith. I believe they truly believe they are telling us the way it will be. However, a center controller WILL NOT ALLOW IFR TRAFFIC IN AN ACTIVE MOA OR ATCAA. Flying VFR in an active MOA is okay if the weather is clear and there are large bombers in the airspace. Flying VFR in an active MOA in less then good weather, and or with fighter type aircraft is NOT SAFE. To believe otherwise is naïve, and to state otherwise is irresponsible. It is doubtful that the briefer has ever been denied access to a piece of airspace that suddenly turned active and been vectored 60 miles out his way because someone didn't do their job. He has never had to reroute and make an unscheduled fuel stop for these reasons; I have. Long after they (the briefers at the public meeting) are transferred or retired we users will continue to be dealing with broken promises, more restrictions, etc. I expect that once this airspace is established, it will be in use more than the Air Force briefers and your EIS tells us, and we believe the Gap ATCAA'S will be active more often, further burdening our operations.

SA-3

NP-7

The information to pilots for pre flight briefings about MOA'S and ATCAA'S have historically been unreliable, and inaccurate. I am paying (as a tax payer and user) to get accurate, reliable information on special use airspace from normal Flight Service Station channels. Many of the Flight Service Station briefers don't even know how to find this information. With your (USAF and FAA) track record, we users expect the Powder River Training Complex will be a nightmare from a planning and operational standpoint.

AM-12

With a planned complex this large and other types of aircraft using this airspace, the implication is that you'll be inviting other units to Ellsworth The fuel savings to the Air Force appears non-existent because instead of the local units traveling to existing ranges, other units will be traveling to Powder River. Ellsworth and the Powder River Training Complex will become busier and more congested, and our company's operations will suffer further.

SO-14

Again, with the frequency of our trips through the airspace in question, and the track record of timely, accurate, and reliable information to pilots, I expect this huge airspace proposal to be a fiasco for many years to come.

John Campbell
Chief Pilot True Drilling Company

Linda DeVine
Program Manager
ACC/A7PS
129 Andrews St., Suite 337
Langley AFB, VA 23665-2701

Dear Ms. DeVine:

Thank you for the opportunity to comment on the Draft Environmental Impact Statement (DEIS) for the Powder River MOA Training Complex. The proposed action would change where Air Force training exercises occur over National Forest System (NFS) lands managed and administered by the Custer National Forest. The Forest Service, Custer National Forest, is providing the following comments.

We acknowledge the efforts of the Air Force to expand their training area to reduce fuel costs and continue to provide training for their pilots with this effort. We do ask that some things be clarified or considered in more detail. Training flights already occur over much of the Ashland and Sioux ranger Districts in Powder River and Carter counties, MT and Harding County, South Dakota, in the current Powder River A and B MOAs. Staff from each ranger district report they have not heard of problems as a result of the use of that airspace.

1) Use of Above Ground Level vs. Mean Sea Level

The presentation at the Buffalo, SD presentation mentioned having planes at certain elevations above the ground. One was Above Ground Level (AGL) for most flights. However, another type of training flight mentioned would use Mean Sea Level (MSL) instead. We suggest using AGL as the guide when talking about all flights unless a specific training need is identified that needs to use MSL instead.

AM-32

2) Archaeology

The Forest Archaeologist indicates there is no reference or analysis of the action to the North Cave Hills, South Cave Hills, or Slim Buttes cultural landscapes. It is our understanding that the North and South Cave Hills land units of the District are considered sacred to the Lakota, Mandan, Hidatsa and Arikara tribes and are used for vision quests, solitude, etc. These three land units are part of the Sioux Ranger District and are located in Harding County, South Dakota. The Sioux Ranger District consists of eight land units, five of which are located in South Dakota

CU-2

3074

and the remaining three in southeast Montana, in Carter County. We recommend that you may wish to contact the tribes regarding those areas they might consider sacred. CU-2

There appears to be no analysis on the effects of noise and vibration, related to sonic booms and low altitude fly-overs, to the geologic units where rock art sites currently listed on the National Register of Historic Places are located. The sites are listed in tables, but no analysis is disclosed if there are potential effects. Also, there does not appear to be analysis of effects to four potentially eligible historic structures located within the analysis area - Jessie Elliott Guard Station, Tri-point Lookout, and the Molstad Cook shack located on the Sioux Ranger District; and Poker Jim Lookout and Whitetail cabin located on Ashland Ranger District. Environmental Consequences address potential effects on p. 4-83 of the DEIS but these structures are not included. The concern is the potential effects of noise and vibration to the rock art sites and historic structures located on the Forest and within the proposed project area. We would appreciate it if you would evaluate the effects of noise and vibration to these resources. NO-2

Find enclosed copies of the Record of Decision for the Sioux Ranger District Oil and Gas Leasing Final Environmental Impact Statement, Appendices and maps. This reference provides information regarding heritage sites and traditional cultural properties on the South Dakota portion of the Sioux Ranger District. Also enclosed are copies of the site forms for the historic structures. These site forms are confidential documents and not subject to the Freedom of Information Act (FOIA) requests.

3) Botany

The Forest Botanist has recommended that several species of sensitive plants be included in the analysis. All but one of these species are considered Northern Region Forest Service Sensitive Species, and one is a Species of Interest. Forest Service sensitive species are analyzed pursuant to the National Forest Management Act (NFMA) to determine whether the effects of an action to these species would cause a trend toward listing under ESA. The single Species of Interest in this instance should be considered like a Sensitive Species, the determination of effects being similar to that of a Sensitive Species. These species are indicated in the table below. Recommended additions are indicated in "red" colored text. BI-9

Forest Service, Custer National Forest additions to Appendix K. Add to footnote 2, after FSR_= USFWS Sensitive and Region; USFS = Forest Service Sensitive or Species of Interest.

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
		ND	SD	MT	WY		
Nutall desert-parsley	Lomatium nuttallii			Big Horn, Rosebud		USFS Species of Interest	Open, rocky pine woodlands in mid to

							lower elevation.
Pregnant sedge	Carex gravid var. gravida			Big Horn, Carter, Powder River, Rosebud		USFS	Green ash ravines and wooded draws.
Visher's buckwheat	Eriogonum visheri			Carter		USFS	Barren rock outcrops or clay outwash.
Barr's milvetch	Astragalus barrii			Powder River, Rosebud		USFS	Gullied knolls, buttes, & barren hilltops, often on calcareous soft shale and siltstone.
Ovalleaf milkweed	Asclepias ovalifolia			Carter		USFS	Prairies and woodlands in sandy, gravelly or clayey soils.
Prairie gentian	Gentiana affinis		Harding			USFS	Wet meadows, shores, seeps, springs, and low prairie.
Mountain bluebells	Mertensia ciliata		Harding			USFS	Forested slopes, damp thickets, moist

Page 3

3074

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
							valley bottoms.
Small yellow lady's slipper	Cypripedium parviflorum			Carter		USFS	Fens, damp mossy woodlands, seepage areas.

In Appendix K, add to footnote 2, after FSR_= USFWS Sensitive and Region; USFS = Forest Service Sensitive or Species of Interest.

4) Fire, Fuels, and Fire Suppression, and Emergency Aircraft

The Forest Service recommends using a combination of the National Fire Danger Rating System's (NFDRS) Adjective Fire Danger Rating and the National Weather Service's Red Flag Warning system to determine times when flare use should be suspended. The NFDRS Adjective Fire Danger Rating is based on indices that track season long and short term fire danger trends by combining calculated Staffing Levels and Ignition Component. We suggest utilizing Miles City Dispatch calculated values for determining the Adjective Fire Danger Rating and suspending flare use between 1000 and 2100 during days of Very High and Extreme Adjective Ratings or raising the minimum altitude for flare deployment to 5000 feet during Very High and Extreme rating days. Very High and Extreme ratings tend to correlate with the potential for numerous fire starts and large fires thus representative of environmental conditions where flares used at low altitude would cause a fire. Additionally, the National Weather Service issues Red Flag Warnings when predicted wind speed, minimum relative humidity and/or lighting activity reach critical thresholds for a particular fire weather zone. The Forest Service recommends suspending flare use during Red Flag Warning issuances.

SA-5

During fire season (June-September) how much notice will Miles City Dispatch be given of planned exercises. We would ask that large quarterly exercises be scheduled in June or late September to avoid the peak of fire season and fire aviation traffic which is typically mid-July through the first part of September to reduce airspace traffic conflicts.

AM-12

SA-13

We have reviewed the July 2008 scoping comments submitted by the Bureau of Land Management (BLM) and concur and incorporate those comments into our recommendations. The Forest Service and BLM jointly work together with other Federal, Montana State and local departments, such as the Department of Natural Resources and Conservation, as well as the Bureau of Indian Affairs in the management and suppression of fire in the Eastern Montana Fire Zone (EMFZ). Due to the large number of cooperating agencies in EMFZ and the need for rapid fire management response, we want to emphasize the need for quick, efficient and effective communication between the Air Force and Miles City and/or Billings Dispatch Center(s).

SA-19

3074

5) Recreation

The Proposed action Powder River Training Complex (PRTC) completely covers the Ashland Ranger District, completely covers seven of the eight land units that comprise the Sioux Ranger District (Long Pines, Ekalaka Hills, Chalk Buttes, East Short Pines, West Short Pines, North Cave Hills, and South Cave Hills), and partially covers the eighth land unit on the Sioux Ranger District (Slim Buttes).

The Ashland and Sioux ranger districts on the Custer National Forest are very popular destinations for hunters. National Forest System (NFS) lands provide an important recreation opportunity for hunters both in local communities and those who travel from neighboring states. Families return annually to hunt on these particular lands. Hunting provides individuals an important connection to the land, an opportunity to engage in individual and family hunting traditions, and a way to provide meat for oneself and family. During the various hunting seasons, use of the Forest occurs throughout the week, though use is heaviest on weekends. Noise from aircraft has the potential to negatively affect hunters and their prey. LV-5 SO-6

Review of the Powder River Training Complex Draft EIS and Executive Summary, indicates that based on the noise, safety, biological, and land use analyses, it appears that impacts to recreationists, in particular hunters, and big game are likely to be minor in both context and intensity under all of the action alternatives and the no action alternative. From a recreation perspective, there is no clear preferred alternative. (The no action alternative concentrates impacts, although they would still be expected to be minor; the action alternatives disperse impacts over a larger area, but portions of the additional area are utilized by recreationists on the Forest.)

6) Wildlife

The Forest Wildlife Biologist has recommended that several wildlife species be included in the analysis. Some of these species are considered Northern Region Forest Service sensitive species, and others are Forest Plan Habitat Indicator Species (also known as Management Indicator Species (MIS)), and other species are Forest Plan key species. Forest Service sensitive species are analyzed pursuant to the National Forest Management Act (NFMA) to determine whether the effects of an action to these species would cause a trend toward listing under ESA. The analysis of Habitat Indicator Species and Key species ensure an action is consistent with the Custer National Forest Land and Resource Management Plan (Forest Plan) pursuant to NFMA. These species are indicated in the table below. Recommended additions are indicated in "red" colored text. Please make the Biological Evaluation (BE) available for review. BI-9

Forest Service, Custer National Forest additions to Appendix K. Add to footnote 2, after FSR_= USFWS Sensitive and Region; USFS = Forest Service Sensitive, Management Indicator Species, or Key Wildlife Species.

3074

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
		ND	SD	MT	WY		
Blue-gray gnatcatcher	*Polioptila*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Sensitive	Open stands of juniper and limber pine with intermixed sagebrush.
Loggerhead shrike	*Lanius ludovicianus*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Sensitive	Grassy pastures that are well grazed, nest in shrubs or small trees, preferably thorny such as hawthorn.
Long-eared myotis	*Myotis evotis*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Sensitive	Use a variety of habitats but are strongly associated with coniferous forests.
Long-legged myotis	*Myotis volans*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Sensitive	Primarily a coniferous-juniper forest bat found at moderate elevations (≥6000ft) but may also inhabit riparian cottonwood bottoms and desert areas.
Greater Short-horned lizard	*Phrynosoma hernandesi*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS' Sensitive	Areas with short, sparse grass or sagebrush; flats with pebbly or stony soil; and rock outcrops.
Western kingbird	*Tyrannus verticalis*		Harding	Big Horn, Carter, Powder River,		USFS, MIS	Open or partially open country with scattered trees, including agricultural

3074

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
				Rosebud			lands.
Lark sparrow	*Chondestes grammacus*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Open or partially open country with scattered trees, including agricultural lands.
Bullock's oriole	*Icterus bullockii*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Open deciduous woodland and riparian areas.
Yellow warbler	*Dendroica petechia*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Brushy riparian especially with willows.
Ovenbird	*Seiurus aurocapillus*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Mid-late successional, closed-canopied deciduous or deciduous/conifer forests with limited understory.
Golden eagle	*Aquila chrysaetos*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Key Species	Open hilly to mountainous areas. habitat
Merlin	*Falco columbarius*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Key species	Patchy shrub/grassland habitats with large trees to support nesting (secondary nester).

In Appendix K, add to footnote 2, after FSR_= USFWS Sensitive and Region; USFS = Forest Service Sensitive, Management Indicator Species (MIS), or Key Wildlife Species.

Page 7

3074

The Forest Wildlife Biologist indicates that he could not find the Biological Assessment and recommends that one be prepared, pursuant to the Endangered Species Act, and as noted in section 3.6.2 of the DEIS. Please make the Biological Assessment available for review. BI-9

The Forest conducts flights for wildlife surveys (e.g. goshawk nest surveys), reconnaissance flights after lightning activity or infrared flights to determine hot spot activity during fire operations. Please clarify what procedure will be used when coordinating flights with the DoD flight scheduling desk at Ellsworth AFB. The nature of some of these flights does not warrant requesting a TFR due to the limited amount of flight time required. How much consideration and how far in advance would we be able to schedule flights to avoid conflicts with planned exercises? AM-1

Again, thank you for the opportunity to comment on the DEIS for the Air Force's proposal to expand the Powder River MOA Training Complex. Please contact Mark Slacks, Forest Planner, by phone at 406-657-6205x240 if you have any questions regarding our recommendations. Also enclosed is a CD that contains a copy of the Forest Plan for the Custer National Forest, Record of Decision to the Forest Plan, and Management Area Maps.

Sincerely,

Frederick W Prange (For)

November 12, 2010

Ms. Linda DeVine
HQ ACC/A7PS
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Subject: Comments on the Draft Environmental Impact Statement for the Powder River Training Complex

Dear Ms. DeVine:

Weather Modification, Inc. is the primary contractor providing specially-modified aircraft and pilots for the North Dakota Atmospheric Resource Board (NDARB) cloud seeding project each summer. The ND Cloud Modification Project (NDCMP) runs from June 1 through September 1 each year, with options to extend through the end of September if growing conditions merit. This project is sponsored and primarily financed by the individual counties that make up the two current target areas of the NDCMP, with the State of North Dakota providing some matching funds, project meteorologists, weather radar support, and overall project management through the ARB. The two project target areas (Districts 1 and 2) together cover 10,425 square miles – nearly 15% of the State's total area.

District 1 is comprised of Bowman and portions of Slope counties with buffer zones on the northern and eastern sides, in the southwestern corner of ND. This area is completely overlaid by the proposed PR-3 MOA and the GAP B and C MOA's. Airborne cloud seeding activities have been going on in this District 1 area since 1961. The objective of the program is to provide relief from damaging hailstorms while also producing enhanced rainfall amounts during the growing season.

WMI's contract with the ARB to provide services for District 1 cost the taxpayers of Bowman and Slope counties about $135,000 for the 2010 summer season. As an indication of the value received for this expenditure, a 2009 study commissioned by the ARB showed that this program produces a 98 to 138-1 gross economic impact resulting from the increased agricultural production that the program allows. This is a huge impact for the citizens of southwestern ND.

SO-28

As part of our contract with the ARB, WMI bases two cloud seeding aircraft in Bowman, ND to serve the District 1 target area. These aircraft, sometimes supplemented by other WMI aircraft from the northern District 2 area, operate around 130 flight hours per season depending upon weather conditions. Operations are conducted 24/7, with the crews on call during the entire

Tel: 1-701-235-5500 • Fax: 1-701-235-9717 • 3802 20th St N • Fargo, ND 58102 • USA
www.weathermodification.com

3075

WEATHER MODIFICATION
INCORPORATED

season ready for immediate launch. Flights generally last around 2 hours, with the entire flight track normally contained within the District 1 area. SO-28

Figure 1 (below) shows a map of District 1 with all operational flight tracks plotted; blue is District boundaries and buffer zone areas, black is flight tracks while not seeding, green / yellow / red are flight tracks during seeding activities.

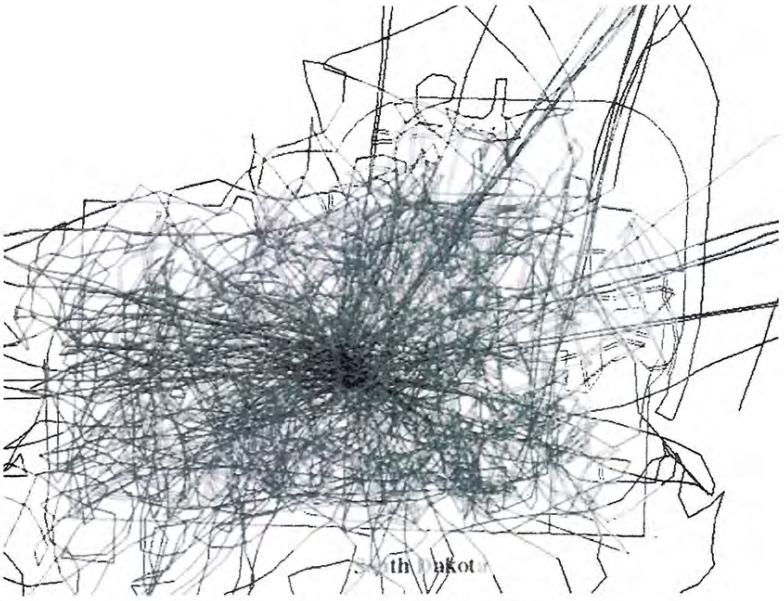

Fig. 1: 2010 NDCMP District 1 cumulative flight tracks

This graphic shows the unpredictable routes that the seeding aircraft fly during operations, as their flight paths are dictated by the thunderstorms around which they must operate. While seeding takes place only to target storm cells that will impact the District, the aircraft must also work around the storms to gain access to the proper areas of the storm cells for effective seeding. Safe operations around severe and cumuliform weather cells also require that the aircraft crews be able to escape the storm if lowering visibility or other storm growth were to SA-3

Tel: 1-701-235-5500 • Fax 1-701-235-9717 • 3802 20th St N • Fargo, ND 58102 • USA
www.weathermodification.com

3075

WEATHER MODIFICATION
INCORPORATED

trap them, precluding a visual return to their base at Bowman. Also note that approximately 30-40% of these flights take place during nighttime hours.

While most of the seeding flights are conducted near the cloud bases under visual flight conditions (VFR), about 15% of District 1 seeding flights are conducted at "cloud top" (in and around the tops of the growing cumulus areas at altitudes between 15–23,000 ft) under instrument flight rules (IFR). And some flights that start as VFR operations become IFR flights when conditions deteriorate. This means that for effective and safe flight operations the WMI aircraft MUST be able to operate under IFR in this area, as well as the surrounding area if needed to skirt the severe weather.

SA-3

This raises several operational and safety issues that could be adversely impacted by the expanded MOA areas.

1. While the WMI seeding aircraft do mostly operate VFR, by necessity they do not fly a pre-planned route, speed, or altitudes. VFR flight plans are not filed as the route, altitude, duration, or even the eventual destination of the flight are all unknowns when the aircraft is launched. Where the storms go, so must go the airplanes. While the WMI aircraft are always coordinating with each other they are not always going to fly a predictable flight path which could increase collision hazards with military aircraft during MOA operations.

SA-1

2. When the WMI aircraft are called to operate as IFR flights for certain mission parameters, they will need to be able to do so immediately. Thunderstorms do not occur at preplanned times, and this means that the WMI crews have little advance notice when they are called to fly. Even the best forecasting cannot accurately predict the exact onset and timing of thunderstorm formation or movements, and even though the WMI aircraft are guided by the NDCMP ground based weather radar at Bowman this does not afford extra time at the start of storm formation. Therefore while the draft EIS mentions coordination with Ellsworth AFB to "deconflict" the airspace, WMI aircraft will need that to happen very quickly. We simply are not in a position to plan ahead.

AM-13
SA-19
SO-28

3. As already pointed out, when the weather conditions deteriorate making it unsafe to remain VFR, WMI aircraft will need to be able to "airfile" IFR flight plans and transition to those plans IMMEDIATELY. This is a safety issue; to operate safely around severe weather means that all options must be available to the WMI aircraft crews. Since the only reason they will be flying around the thunderstorms is to protect crops and property for the taxpayers in the target area, they must be able to "stick with it" as long as possible before they must abandon the area. When the weather is clear, WMI aircraft will not be operating except if transiting between storms or bases.

SA-3

AM-13
SA-19
SO-28

Tel: 1-701-235-5500 • Fax: 1-701-235-9717 • 3802 20th St N • Fargo, ND 58102 • USA
www.weathermodification.com

3075

WEATHER MODIFICATION
INCORPORATED

Simply stated, the WMI aircraft must be afforded every opportunity to operate in the area of the proposed PR-3 MOA without undue delays or prohibitions on IFR flights, and in a safe manner without added collision hazards while operating in an already potentially hazardous flight environment. Coordination with Ellsworth AFB would of course be welcome but "deconfliction" of the airspace cannot be delayed for any appreciable amount of time. Procedures and protocols must be put in place that will allow these operations in a timely manner.

SA-15
AM-13
SA-19
SO-28

Weather Modification, Inc. has been safely operating in and around severe weather conditions around the globe with our aircraft since 1961 without an injury accident. We pride ourselves in providing a safe and reliable service to our customers, and those same customers – in this case, taxpaying citizens of the State of North Dakota - deserve the freedom to be protected from the hailstorms and drought that threaten their livelihoods.

Thank you for the opportunity to again provide comments regarding this matter.

HQ ACC/A7PP
129 Andrews Street, Room 317
Langley AFB, VA 23665-2769

Dear Ms. DeVine,

The expansion of the Powder River MOA at this time appears unnecessary. We are engaged in a war where the United States has technological superiority. It has been stated that we will begin decreasing our forces overseas. The airspace which is currently in place is massive in size and any further addition will cause undo hazard to persons, property and business. The majority of commercial aviation operates under Instrument Flight Rules, when active the MOA will restrict such operations.

HQ ACCC/A7PP
129 Andrews Street, Room 337
Langley AFB, VA 23665-2769

Dear Ms. DeVine,

American Airlines (AA) has reviewed the Draft Environmental Impact Statement (DEIS) for the proposed Powder River Training Complex (PRTC), which expands Military Operations Areas (MOAs) and Air Traffic Control Assigned Airspace (ATCAA) over portions of Montana, Wyoming, North Dakota, and South Dakota. AA strongly supports our armed forces and the need to develop a realistic training environment to protect our democracy and our citizens.

We also pride ourselves by being supportive of the families of our military personnel with our annual Skyball and Snowball Express activities. In addition, we have several aircraft in our fleet sporting yellow ribbons to express our gratitude to those that serve or have served. The latest, a Boeing 767 named Flagship Independence, was dedicated just last week at JFK Airport. The observance also served as a send-off for approximately 150 wounded warriors and their guests as they departed on the aircraft for a weekend in Las Vegas.

Initial briefings on the PRTC indicated that activities would be limited to quarterly Large Force Exercises lasting up to 3 days per event. Although this activity would have a significant impact on the routes we fly in the area, we were able to support the proposal with the limited number of days of activity. However, the DEIS indicates that the usage will now be up to 240 days a year and would impact more than 500 IFR flights daily at FL370 and below. We find that the impact upon the National Airspace System (NAS) as well as our operation will be unacceptable.

GE-14

Impact upon AA flights will primarily be in two areas:

1. Flights to and from destinations in the Pacific Northwest will have to be routed around the airspace. Our analysis indicates that the impact will be about 9 minutes additional flying time and about 133 gallons of fuel for each flight that is required to circumnavigate the airspace. This adds up to about $445 per flight including other operating costs factored in.

2. Convective weather activity across the Midwest or Ohio Valley many times forces additional flights north through the PRTC airspace. Due to the part time

SO-7

SYSTEM OPERATIONS CONTROL, P.O. BOX 619617, MD 867-GSWFA, DFW AIRPORT, TEXAS 75261-9617

3078

usage of these routes it is difficult to quantify the impact. However, when there is already one constraint in the airspace that is impacting traffic flows, then any additional constraint, such as the PRTC, will only exacerbate the problem by limiting the number of options, resulting in additional miles flown and fuel burn. SO-7

With the number of flights that transit the proposed PRTC airspace each day, the impact to flights required to be routed around the areas will be significant. This results in less than optimum profiles for our flights and limited opportunities to manage abnormal situations during weather events.

Use of the PRTC above FL260 on a daily basis will have a significant adverse impact upon the operational efficiency of American Airlines. This also adversely affects the people we serve, our passengers. As a result, American Airlines cannot support the proposed PRTC as it is outlined in the DEIS. SO-22 GE-2

Sincerely,

Jeffrey B. Osborne

December 22, 2010

Ms. Linda DeVine
HQ ACC/A7PP
129 Andrews Street, Room 317
Langley, AFB, VA 23665-2769

Dear Ms. DeVine:

The Northern Cheyenne Tribe (Tribe), again, appreciates all your efforts to provide comments on the hearing that was held on the DEIS on December 7, 2010 regarding the Powder River Training Complex (PRTC).

The Tribe has an array of concerns regarding the far-reaching and long-term effects of the PRTC on the welfare of our members and health of the Reservation environment and nearby areas. Because the PRTC will affect the Tribe's homeland, we take a long view of how the project will impact our people, both their economic and social well-being, but also the environment to which their traditional, spiritual and ceremonial practices are integrally linked.

Below is a summary of comments from the Tribe, tribal members, and tribal agencies regarding the DEIS on the PRTC. We ask that the Air Force examine the effects of the PRTC on these resources in its preparation of a DEIS for the project.

1. The Tribe monitors air pollution from various sources on and off the Reservation. We are very concerned with the potential emissions such as carbon monoxide, sulfur dioxide, uranium tailings, and other toxins from the "jet trail" and their long term negative effects on human health.

AQ-5

LITTLE WOLF AND MORNING STAR - Out of defeat and exile they led us back to Montana and won our Cheyenne homeland that we will keep forever.

2. At the Tribe's request, the EPA designated the Northern Cheyenne Reservation a Class I air shed in 1977. This reflected the Tribe's long-standing value of protecting the clean air of its homeland in southeastern Montana. We are concerned with the impacts to visibility and air quality caused by the PRTC, particularly with respect to carbon monoxide, nitrogen oxides, sulfur dioxide, uranium tailings and other pollutants that are likely to be emitted by the increase in air traffic over the Reservation's air space. The Air Force should analyze the effects of the PRTC on the "increments" established for the Reservation under the Prevention of Significant Deterioration (PSD) provisions of the Clean Air Act, 42 U.S.C. §7473. This analysis is required under NEPA because an EIS must discuss the possible conflicts of the proposed action with federal, state, and local (including tribal) laws as well as the "significance" of the potential impacts. 40 C.F.R. § 15-2.16(a)-(c). The Montana DEQ prepared an "increment consumption analysis" as part of its EIS for the Roundup power plant in 2002. This document showed that the Class I increments for 24-hour and 3-hour SO^2, had been exceeded and that the post-baseline projects such as the Colstrip Units #3, and #4 have consumed significant parts of the increments for annual NO^2 and 24-hour PM_{10}. The EIS for the PRTC should include a similar increment consumption analysis so as to avoid any further violations of federal law.
3. Visibility is a very significant issue for the Tribe. The EIS should analyze the cumulative impacts of the PRTC on visibility on and near the Reservation as well as acute visibility impacts from individual jet contrails.
4. The deployment of chaff and flares can cause fires leading to collateral impacts to the Reservation and the property of the Tribe and tribal members. Potential fire concerns affect the total environment of the Reservation from quality of water, fish, wildlife, plant fauna, to the people who live here. The scoping document indicates that the Air Force will coordinate fire response efforts. The EIS should examine this in detail given the large area covered by the project, the limited resources of the Reservation to combat PRTC-caused fires, and the importance of a quick response time to protect tribal resources, including timber in the hot, dry Montana summer weather.
5. Noise pollution is a significant concern. Sonic booms would be highly disruptive to the tribal communities on and near the Reservation. Noise pollution can disrupt normal activities such as sleep, prayer, ceremonies, and other traditional and day-to-day activities. Tribal members have told us that they chose to live on the Reservation (rather than urban areas) because of the peace and quiet that life here provides, particularly when outside in the hills, valleys and forests for fishing, hunting, gathering berries and medicinal plants, and participating in traditional ceremonies and family gatherings. A major change in air traffic over or near the

LU-9

AQ-6

AQ-7

SA-5

SA-6

NO-5

NA-10

Reservation would severely impact this vital aspect of the local environment. Sudden and dramatic noise impacts could cause short- and long-term health problems, especially for those that are sensitive to noise. The EIS should examine the baseline noise on the Reservation and predict the increase in noise caused by PRTC in its analysis of the impacts of noise on the Reservation environment. It is critical that this examination considers "single-event" (*i.e.* the noise caused by a single fly over or sonic boom) rather than average noise that will be caused by the PRTC.

NA-10

NO-9

6. The threat of aircraft accidents, during training, is a serious concern. Fallout from air collisions and other potential accidents would create hazards for the local environment, including safety of those on the ground, fire, and property damage. The distraction caused by unpredictable, low flying, loud aircraft could also lead to an increased risk of accidents on the ground.

SA-1

7. The PRTC would conflict with and jeopardize current air traffic over the reservation, such as by ranchers who own planes. The PRTC would also significantly impact future plans for an airport within the Reservation. In addition to considering these effects on the Northern Cheyenne Reservation, the Air Force should examine the effects of other commercial and military aircraft operations located in proximity to Indian reservations in other parts of the country. We understand that such operations near other reservations have adversely impacted on-reservation economic development efforts.

SO-10

8. The Reservation's wildlife is already scarce and subject to intense pressure from coal bed methane and other energy development near the Reservation. The EIS should examine how PRTC activities will impact wildlife on and near the Reservation, including whether animals will take refuge in other areas where there is less aerial activity. Deer, elk, and other land animals are vital to the subsistence and ceremonial existence of tribal members, and we cannot afford to have additional pressures on these resources. The EIS should examine how reduced access to wildlife will affect the subsistence, cultural and ceremonial practices of the Tribe.

BI-4

LU-5

9. The spirituality of the Northern Cheyenne people will be compromised by the PRTC. The reservation and surrounding area is considered one contiguous cultural landscape. There are many places where ceremonies are performed that often last for several days. Prayers, ceremonies and other spiritual activities would be significantly and adversely affected by the noise, visual and other likely impacts of the PRTC. The EIS must consider these impacts and, as requested below, an alternative that would eliminate or significantly mitigate them.

NA-4

10. The social and economic impacts are far reaching and will create unforeseen circumstances. For example, economic development on the Reservation, which has

NA-10

historically been very difficult to achieve, could be frustrated because of noise impacts caused by low-altitude and supersonic flights, possible on-the-ground accidents related to sudden and loud noises and other adverse impacts of the PRTC. This is also an environmental justice issue, as the impacts of the PRTC would be more heavily felt by the tribal community than other groups. The Tribe has a high rate of poverty and must be able to take advantage of any economic development opportunities that are feasible for the remote location of its Reservation. For example, the Tribe is considering development of a casino on tribal trust lands near the Tongue River Reservoir.

NA-10

EJ-2

The Tribe requests that the Air Force consider a No-Action Alternative (4.6.3.4) including a No-Action Alternative (4.7.3.4) that would eliminate the creation of the PRTC and eliminate the expansion of training airspace. This would provide that PR-A, PR-B MOAs would not overfly Native American reservations. Powder River Training aircraft would not overfly Devils Tower, Bear Butte, and fly adjacent to Deadwood at altitudes above 18,000 feet MSL.

GE-2

The above comments are comments gathered by the Tribe as part of the hearing on December 7, 2010 and also comments from the communities.

If you have any questions, please feel free to contact my office at 406-477-6284 or email me at Leroy.spang@cheyennenation.com.

Sincerely,

Leroy A. Spang, President
Northern Cheyenne Tribe

C: Northern Cheyenne Tribal Council
Steve Chestnut, Tribal Attorney

BIG HORN RIVER ALLIANCE

PRESERVING • PROTECTING • ENHANCING

November 5, 2010

Linda DeVine
HQ Air Combat Command/A7PP
129 Andrews St
Suite 102
Langley AFB Va. 23665-2769

Ms. DeVine,

Please accept these comments and include them in the formal statements that will be provided to the agencies regarding the PRTC determination.

The *Bighorn River Alliance* is a non-profit conservation organization created to preserve, protect, and enhance the Bighorn River fishery in southeastern Montana. We oppose plans to expand the PRTC airspace and training area as proposed during the hearing in Hardin, Montana on Friday, Oct 22, 2010. GE-2

We are concerned that the PRTC airspace expansion will negatively impact the quality of the recreational experience on the Bighorn River. It will also be detrimental in attracting and retaining recreational users which will affect commercial activity in the area. LU-1 SO-9

The PRTC did not provide factual evidence for several material claims, and in some cases provided questionable data to support their efforts to expand the PRTC airspace. Our concerns are as follows:

a. Testimony and information in the Power Point presentation indicated that decibel levels would be at, or below, 100db. This contradicted the Air Forces own data that shows decibel levels of over 150 db at flights above 2000'. NO-4

b. It was stated that the LFE would not have an impact on property values; yet this was not supported with any hard data. It is well established that property values are adversely affected when property is in proximity to railroad tracks, industrial sites, mining operations, or busy transportation corridors. The operation of military aircraft can create similar problems. We would be interested in hearing more about the noise pollution, plus the risks imposed on Bighorn Valley residents and recreational users in the area. SO-1

P.O. Box 7884 • Fort Smith, Montana 59034 • www.bighornriveralliance.org

3080

BIG HORN RIVER ALLIANCE

PRESERVING • PROTECTING • ENHANCING

c. In the PRTC Power Point, and in all of their printed and on-line data, they describe LFE as only taking place 10 days a year. In reality, it is very possible that it will take place for 12 days a year, and based on 20 aircraft generating one sonic boom per flight, there is the potential that we might be dealing with 240 sonic boom events during this time. PN-5

d. The proposed airspace overlay directly impacts Bighorn River recreational users from the Wyoming border to Hardin, Montana. This is the blue-ribbon trout stream section of the river, and is world famous for its angling opportunities. LU-2

e. Penned, free range livestock, and wildlife, will be negatively affected. BI-4

f. Will impede the use of recreational and corporate aircraft trying to access the two public-use airstrips which serve the Bighorn Valley. SO-10

g. We believe the current 9,748 sq miles of airspace is sufficient. PN-2

h. PRTC airspace does not provide for non-military corridors utilizing different altitudes for different classes of aircraft. AM-20

i. The PRTC proposal did not recognize one airport directly under the proposed airspace (PMD Ranch, BIL VOR 112* radial, 43.7DME fix) or the public use airport we depend on, 5U7 in their assessment. AM-4

In summary, the boundaries of the proposed PRTC airspace would negatively affect recreational and commercial opportunities along the Bighorn River valley. We request that the "No Action" alternative be selected. GE-2

Please confirm that this letter was received, and that our concerns were considered as part of the Environmental Impact Assessment that is to be conducted.

Respectfully,

Hale Harris

Written Comment Sheet
Public Hearing for the Proposed Powder River Training Complex

Thank you for your input! **DATE:** 10-27-10

PLEASE PRINT

The proposal is excessive in size and scope and requires more review. AM-6

The Air Forces gained benefits will Negatively effect the corporate aviation operators as we will see increased fuel, maintenance and other associated costs. These will be passed on to the consumer. SO-7

Corporate aviation within the energy industry is not even addressed in the EIS. SO-6

Aircraft as far south as Houston will be effected daily, as energy operations fly into and over the proposed area on a daily basis.

- ☐ Yes, please include me in the mailing list for distributing the Final EIS. I would like to receive a copy in: ___ CD (electronic format) ___ hard copy format
- ☐ No, please do not include me in the mailing list for distributing the Final EIS. I do not wish to receive an EIS or further information.

PLEASE NOTE: This Draft EIS is provided for public comment in accordance with the National Environmental Policy Act (NEPA), the President's Council on Environmental Quality (CEQ) NEPA Regulations (40 CFR §§1500-1508), and 32 CFR §989, Environmental Impact Analysis Process (EIAP).

The EIAP provides an opportunity for public input on Air Force decision-making, allows the public to offer inputs on alternative ways for the Air Force to accomplish what it is proposing, and solicits comments on the Air Force's analysis of environmental effects.

When making an oral comment, please clearly state your name and the name of the organization, if any, which you are representing before you begin your comments. Please do not provide any other personal information, such as your home address and phone number when making an oral comment. Your oral comments will be used to develop a transcript and permanent record of this meeting. This transcript will be published in the FEIS. If you would like a copy of the Final EIS or other associated documents, you may state that on a written comment card or add your name and address to the mailing list.

Providing personal information is voluntary. If you choose to not provide personal identifying information, your comments will be given the same weight and consideration as any other comments submitted. Private addresses provided will be compiled to develop the mailing list for those requesting copies of the Final EIS. Only the names of the individuals making comments and specific comments will be disclosed. Personal home addresses and phone numbers will not be published in the Final EIS.

Please hand this form in at a public hearing or mail before November 15, 2010 to:

1.8 RESPONSES TO COMMENTS

The following comment codes are used in the preparation of the Comment Response Matrix provided in Table 1.8–1.

AM	=	Airspace Management	EJ	=	Environmental Justice	PN	=	Purpose and Need
AQ	=	Air Quality	GE	=	General	PR	=	Physical Resources
BI	=	Biological Resources	LU	=	Land Use	SA	=	Safety
CM	=	Cumulative	NA	=	Native American	SO	=	Socioeconomics
CU	=	Cultural Resources	NO	=	Noise			
DO	=	Description of Proposed Action and Alternatives	NP	=	National Environmental Policy Act			

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
AM = Airspace Management			
AM-1	1034, 2007, 2051, 2062, 2081, 2096, 3025 3033, 3049, 3074	Concern about coordination between the Air Force and the FAA for the recall of military aircraft from the airspace as necessary in a timely manner.	As explained in DEIS and the FEIS Section 1.5, the FAA is a cooperating agency and will make decisions regarding airspace establishment. FEIS Section 2.3.1 describes mitigations associated with the scheduling of the airspace. The Air Force will establish procedures acceptable to the FAA to recall military aircraft from the airspace prior to the Air Force operating in the proposed Low MOAs. Military aircraft would be recalled in a timely manner for a number of reasons such as IFR arrivals and departures to airports within the airspace, as well as to support emergencies.
AM-2	1082, 2009	Concern about impacts from increases in military air traffic from Ellsworth AFB to the proposed airspace.	As described in FEIS Section 2.5.2, the increased size availability of a local training airspace would allow an increase in training activity; however, total flight operations would not be expected to exceed those analyzed and published (12,000) in the 2008 Ellsworth AFB Air Installation Compatible Use Zone (AICUZ) Study, which is available on the Ellsworth AFB website (http://www.ellsworth.af.mil/shared/media/document/AFD-090428-076.pdf).
AM-3	1044, 1058, 1060, 2007, 2010, 2020, 2025, 2034, 2043, 2062, 2063, 2068, 2071, 2073, 2077, 2091, 2103, 2107, 2109, 3003, 3009, 3012, 3023, 3024, 3025, 3028, 3053, 3054, 3056, 3061, 3064, 3065, 3070	Concern for the lack of radio and radar coverage and communication. Can the Air Force work with the FAA to place radio and radar equipment? Concern regarding the uncertainty of low-level flights.	FEIS Section 4.1 acknowledges the limitations of radio communication and radar coverage within the airspace. FEIS Section 2.3.1 describes the scheduling of the airspace. The Air Force acknowledges that limited radio and navigation coverage exists in many of the areas proposed for the PRTC and is committed to not schedule low MOAs until adequate communication to withdraw a training aircraft is established. To partially address this concern, the Air Force will coordinate with FAA to establish procedures to announce to other aircraft when military aircraft enter or exit training airspace below 12,000 feet MSL and to monitor other aircraft transmissions when operating below 12,000 feet MSL during non-LFE training. The Air Force and FAA will continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			include practices for use of existing data, equipment, and procedures as well as integration of advancements in software and/or equipment.
AM-4	1060, 1100, 2010, 2025, 2066, 2072, 2116, 3012, 3021, 3023, 3028, 3061, 3080	Concern that not all of the airports and airfields are identified in the Draft EIS-particularly the Black Hills Airport. Concern that not all of the registered aircraft are accounted for in the Draft EIS data and that not all of the flights are accounted for in the analysis.	FAA sectional aeronautical charts for Cheyenne and Billings, which encompass the proposed airspace, were used to identify public airports and private airfields under the proposed airspace. Airports or airfields which were not recognized on FAA charts are not included in the analysis. DEIS Section 3.1 included public airports, including the Black Hills Airport, and private airfields. Airport operations reported to the FAA are included in the impact analysis.
AM-5	1039, 2014, 2117, 2060, 2062, 2096, 3025, 3028, 3043, 3044, 3052, 3053, 3054	Concern that the airspace will impact airport access and the setback distances are not adequate to support major airports on the edge of the airspace. Suggestions to expand the setback distances or apply setback distances to airports under the airspace.	FEIS Section 2.3.1 explains the mitigations incorporated to adjust MOA boundaries, activation of PR-1A and PR-1C High MOAs and ATCAAs only during LFEs, distance setbacks for other commercial airports, and setbacks on a Victor airway to support access and transit of the airspace. MOA and ATCAA scheduling, setback distances allow for preferred civil aviation climb or descent rates. As described in FEIS Section 2.3.1 and in accordance with FAA Order 7400.2K, the Air Force will avoid private airfields by 1,000 feet AGL and 1NM radius and public airports by 1,500 feet AGL and three NM radius.
AM-6	1058, 1066, 1095, 1107, 1116, 1118, 2014, 2094, 2118, 3023, 3052, 3061, 3063, 3077, 3081	Concern the airspace is a large area that will be blocked off to civilian aircraft access and will impact general and commercial aviation. Concern the size of the airspace and proposed times of use are excessive for Air Force purposes. Suggestions for additional review and coordination with communities and agencies.	DEIS Sections 1.2 and 1.3 described the reason for the airspace to provide the best training for aircrews, and FEIS Section 4.1 acknowledges that the airspace will impact general aviation and commercial aviation. As described in FEIS Section 2.0, the full extent of the proposed airspace would be active for LFEs. During non-LFE times the Gap MOAs/ATCAAs would not be active. FEIS Section 2.3.1 explains that the ATCAAs would be capped at FL260 and that advance scheduling of airspace and announcement by NOTAM of MOA activation would allow near real-time information to be available.
AM-7	2020, 3023	Is the Air Force going to fly lights off at night? This would prevent VFR access.	The proposed airspace does not include lights out night training in the existing or proposed MOAs.

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
AM-8	1090, 2022, 2089	Do you fly with transponders or use methods to electronically see other aircraft?	Bomber aircraft have transponders. B-1 aircraft do not have equipment to electronically see other aircraft.
AM-9	1067, 2020, 2037	Is this going to become restricted airspace?	This proposal does not include the creation of restricted airspace. The Air Force is only considering the creation of Military Operations Areas and Air Traffic Control Assigned Airspace as described in FEIS Sections 2.4 through 2.7.
AM-10		Comment response code not used.	
AM-11	1067, 2020, 3058, 3061	Concern that the proposed activities would be more appropriately conducted in a Restricted Area.	There is no proposal for restricted airspace, and B-1s currently train in the Powder River MOAs and associated ATCAAs. DEIS Section 1.3 explained why the local MOA and ATCAA airspaces are needed, and DEIS Section 2.3 presented the detailed alternative screening process for the airspace. DEIS Section 1.2 explained that training locations with restricted airspace would continue to be used for specific military training missions.
AM-12	1004, 1008, 1011, 1012, 1033, 1034, 1044, 1059, 1070, 1073, 1090, 1091, 1094, 1111, 2034, 2041, 2059, 2060, 2072, 2081, 2085, 2087, 2091, 2095, 2100, 2103, 2106, 2109, 2115, 3021, 3025, 3026, 3039, 3040, 3052, 3054, 3055, 3056, 3059, 3073, 3074	How will people know when the airspace is hot? How much notice will be given? How will it be scheduled? The Air Force has taken all the flexibility at the expense of civil aviation. The NOTAM system is inadequate. Requests for prior notice of LFEs or training flights in specific areas.	FEIS Section 2.3.1 explains that there would be airspace advance scheduling and 2-hour NOTAM activation allows near real time information. The NOTAM system is the way FAA communicates with civil aviation. Quarterly LFE exercises of one to three days would be scheduled at least 30 days in advance. IFR flights would be accommodated by using the stacked MOAs. Pilots who elected to not fly see-and-avoid through a scheduled airspace or were required to fly weather IFR or other IFR could see an inability to obtain unrestricted access as an adverse impact. The Air Force will continue to coordinate with FAA to support procedures to announce to other aircraft when military aircraft enter or exit training airspace below 12,000 feet MSL and to monitor other aircraft transmissions when operating below 12,000 feet MSL during non-LFE training. The Air Force and FAA would continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may include practices for use of existing data, equipment, and procedures as well as integration of advancements in software

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			and/or equipment.
AM-13	2041, 3006, 3075	Concern for the inability to fly IFR while the MOA is activated to conduct cloud seeding operations. Would like the Air Force to train in PR-3 in morning block.	FEIS Section 4.9.3.1.2 describes cloud-seeding coordination requirements. The Air Force would coordinate with the North Dakota Atmospheric Resource Board to establish procedures whereby Air Force training requirements and weather modification operations can be mutually compatible.
AM-14	1009, 1096, 1109, 1117, 2042, 2066, 2075	Concern aircraft are flying below 500 feet and people are being 'buzzed'. What kind of enforcement is available?	The B-1 has an altitude setting capability which established terrain following at specific altitudes. The terrain-following capabilities are tested prior to B-1 launch to ensure that the aircraft fly at the set altitudes. As described in DEIS Section 1.4, low-altitude proficiency training for terrain-following flights would occur down to 500 feet AGL. Should an aircraft be reported as flying below the authorized altitude, recent aircraft data can be reviewed to determine deviations and appropriate corrective actions can be taken.
AM-15	1007, 2044, 2124	Concern people's buildings are being used as targets.	As described in FEIS Section 2.3, the Air Force avoids low-level overflight of ranches and residences as noted in the Powder River Training Complex Briefing Guide, 14 February 2011, which is required reading for every military user of the Powder River MOA prior to each flight.
AM-16	2059, 3026	Concern that the proposal makes provisions for Victor airways which are being phased out in favor of point-to-point navigation. Proposal needs to consider point-to-point navigation impacts.	Civil aircraft regularly use GPS for point-to-point navigation. GPS point to point VFR could continue to fly see and avoid. Training in an active MOA would be adjusted to support IFR transit and IFR arrivals and departures to airports under the proposed airspace. The Air Force and FAA would continue coordination to develop procedures to handle those nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected airspace to the NAS.
AM-17	2066, 2072, 2106, 2124	There is no discussion of Remotely Piloted Aircraft.	There are no proposed remotely-piloted aircraft (RPA) associated with PRTC action. No RPA aircraft would be based out of Ellsworth AFB. The RPA personnel based at Ellsworth AFB

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			operate RPA remotely through satellites.
AM-18		Comment response code not used.	
AM-19	2087, 2094	The DEIS does not consider other aircraft in the area such as hot air balloons, paragliders, and other small aircraft. It also does not discuss other users who do not reside within or adjacent to the proposed airspace.	DEIS Section 4.1 explained that other light aircraft and paragliding occurs within the area. Frequently, such recreational activity occurs during weekends when B-1s would not normally be training. DEIS Section 4.1.3.1.3 described the airports on the periphery of the proposed PRTC. DEIS and FEIS Section 3.1 contain FAA-documented air traffic use through the airspace during the times the proposed airspace would be active. This includes local flights and transient users who do not reside in, or adjacent to, the proposed airspace. As noted in FEIS Section 4.1, all flight activity, including FAA IFR information, public airports and private airfields, was used to explain potential impacts. Section 4.9 considers other users of the airspace.
AM-20	1056, 2089, 2095, 3080	Will corridors be open 24 hours a day to allow VFR and IFR traffic? Suggestions for non-military corridors are created separate by altitude for different classes of aircraft use.	FEIS Section 3.1.3.4.1 describes the Victor airways and explains that Victor airways would be avoided during day-to-day training and be open 24 hours a day to allow IFR traffic. VFR traffic could use the Victor airways or fly see-and-avoid in an active MOA. During LFEs, from one to three days per quarter for up to ten days per year, Gap MOAs and ATCAAs would be activated an estimated four hours per day. IFR traffic could not be routed through an active MOA. The high and low MOAs would permit IFR routing by adjusting training aircraft operations in the airspaces.
AM-21	1060, 1118, 2051, 2118, 2119, 2095, 3012, 3023, 3037, 3061, 3077	Concern that IFR traffic would not be permitted through the airspace when active. Concern that commercial and GA traffic would have to avoid the airspace while it is active and have to re-route to destination. The corridors do little to mitigate the impacts to airports and GA.	FEIS Section 2.3 explains that the proposed ATCAA ceiling is lowered from FL600 to FL260 and that there would be airspace advance scheduling and NOTAM activation to allow for near real time information. The NOTAM system is the way FAA communicates with civil aviation. Section 4.1 explains that IFR and VFR traffic can operate on the Victor airways. VFR can fly see-and-avoid through an active MOA. IFR traffic could not fly in an active MOA. The Air Force would work with ATC to adjust operations to accommodate IFR traffic. IFR flights would be

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
			accommodated by using the stacked MOAs for training aircraft. Quarterly LFE exercises of one to three days would be scheduled at least 30 days in advance. The Air Force will continue to coordinate with FAA to support procedures to announce to other aircraft when military aircraft enter or exit training airspace below 12,000 feet MSL and to monitor other aircraft transmissions when operating below 12,000 feet MSL during non-LFE training. The Air Force and FAA would continue coordination to develop procedures to handle those nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected airspace to the NAS.
AM-22	2095	Wants to ensure the airspace approved is charted.	FEIS Section 1.6 explains that FAA will make decisions regarding airspace establishment. The FAA will be responsible for charting the approved airspace in accordance with FAA processes (see FEIS Section 2.12) and applicable regulations.
AM-23		Comment response code not used.	
AM-24	2105, 3060	Aircraft avoidance area above 2,000 feet above the Little Bighorn Battlefield National Monument is voluntary.	At the request of the National Park Service, the Little Bighorn Battlefield National Monument will be avoided by low-level flights (below 5,000 feet AGL) from one hour before to one hour after posted hours of operation and at other times as arranged. Supersonic flight would not be authorized in the proposed PR-1C airspace to reduce even remote possibilities of sonic booms at the National Monument.
AM-25	2106	Why is the Air Force training with countermeasures particularly in the context of the current conflict and Al Qaeda's capabilities?	B-1 and B-52 aircrews train with all capabilities of the aircraft to be prepared for all contingencies. FEIS Section 2.8 describes the need for realistic training with countermeasures and Section 2.8.5 describes the countermeasures.
AM-26	2109, 3052, 3058, 3061, 3064	Would like to see more stratification in the MOAs to create more flexibility.	As presented in FEIS Table 2.5-1, the Air Force and FAA have stratified the MOAs and created eight MOAS in PR-1 to create flexibility for transit of the area.

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
AM-27	2094, 2122, 3049, 3056	How many aircraft will train simultaneously during LFEs and non-LFE training? Will there be limitations to the number of military aircraft occupying the airspace at one time? What types of aircraft will train in the airspace?	As described in FEIS Section 2.4.3, during normal training periods, there would be one to two aircraft training in each MOA complex for a total of four to eight aircraft training in the four MOA complexes. During LFEs, there would be approximately 20 aircraft training for two two-hour periods per day for one to three days per quarter up to 10 days per year. As discussed in FEIS Section 2.8, transient (occasional) users of the training areas include B-1s and B-52s from other bases; B-2s from Whiteman AFB; RC-135s from Offutt AFB; F-15s, F-16s, F-22s, and other fighters, tankers, and other aircraft various bases typically from the surrounding area.
AM-28		Comment response code not used.	
AM-29		Comment response code not used.	
AM-30	2134	Do the aircraft carry ammunition?	Ammunition would not be carried for training in the proposed PRTC. Defensive countermeasures (chaff and flares) would be carried in the proposed PRTC as described in Section 2.8.5 of the FEIS.
AM-31	3026	Airspace use figures are inaccurate.	Airspace use figures are derived from FAA IFR data, airport reports of operations, and airfield numbers of based aircraft. The airspace use numbers have been updated to 2013 reports and are accurate.
AM-32	3074	Would like to see using AGL unless necessary to use MSL.	Variations in ground elevation under the airspace make using only AGL impractical. Altitudes are defined in accordance with FAA Order 7400.2. MSL, AGL, and FL are explained in Section 2.4.2 of the FEIS.
AM-33	3056	Concern for coordinating firefighting or reconnaissance activities during fire season. Would like avoidance measures for fire traffic established June to September for no low-level flying training. Would DoD schedulers be able to reserve a 3-4 hour time slot in the late morning/early afternoon to facilitate VFR fire	FEIS Section 2.3.1 describes mitigations incorporated in the proposal. The Air Force will work with tribes, individuals, and others to establish reasonable seasonal avoidance areas. The Air Force commits to expanding the current Memorandum of Understanding for routine fire reconnaissance flights as is done in the current Powder River airspace and the current Memorandum of Understanding. The Air Force would

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
		reconnaissance flights? This would support fire reconnaissance and response.	coordinate with BLM to update the Memorandum of Understanding to include the proposed PRTC. As suggested in Letter 3056 from the BLM at Miles City, the updated Memorandum of Understanding may be a part of a larger Memorandum of Understanding.
AQ = Air Quality			
AQ-1	1048	Would quantities of fuel used for proposed training change air quality in Eastern Montana?	Section 4.4.3 of both the DEIS and FEIS provide analyses of potential air quality impacts that would occur from the project alternatives within all areas, including Eastern Montana. Appendix K includes the supporting air emission calculations. The results of the analyses determined that air emissions from each project alternative would produce less than significant air quality impacts to all areas of the project region, including Eastern Montana.
AQ-2	1073	Need to study the effects of the increased number of planes that will use the area. Sulfur has been shown to modify cloud properties.	Sulfur oxides generated from the combustion of aviation fuels can convert to sulfates and sulfuric acid in the atmosphere, which can then take the form of cloud condensation nuclei and promote the development of both liquid cloud particles and ice crystals. Alternative A would generate small increases in SO_2 emissions compared to existing conditions – an increase of about three tons per year (see Table 4.4-1 of the DEIS and FEIS). These emissions would be spread over about 27,000 square miles of atmosphere and therefore would be adequately diluted to the point that they would not result in substantial changes to cloud formation at any locality.
AQ-3	1050, 1073	Because of Air Force training in the area, air quality is not as good as it once was. The proposed actions will greatly increase air pollution. The only air sampling currently done within the existing training areas is the Crow Indian Reservation in Montana. How much will air emissions increase from existing levels due to increased Air Force activities in the area.	While the Lame Deer PM_{10} site is the only air monitoring station overlain by the proposed PRTC, due to its rural nature, the project region for the most part has very good air quality, as described in Section 3.4 of the DEIS and FEIS. Regarding the impact of proposed training activities to ambient air quality, please see the response to comment AQ-1 from letter 1048.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
AQ-4	3037, 3050	What is the justification for activation of the MOA/ATCAAs beyond the LFEs – this will require rerouting hundreds of flights per day around the airspace. The excess fuel associated with these altered flight trajectories and associated increased emissions do not appear to be addressed in the EIS.	The modified alternatives proposed in the FEIS no longer include the use of airspaces above FL260. Air emissions above FL260 would not degrade air quality. This lower airspace ceiling would minimally affect the routes of commercial airlines in the future and therefore would not result in an increase in emissions from future commercial airlines operations within the project region.
AQ-5	3079	Concern about the potential emissions of toxins from the proposed aircraft trails and their effects on human health.	Section 4.4.3 of both the DEIS and FEIS provides analyses of potential air quality impacts that would occur from the project alternatives within all areas, including the Northern Cheyenne Reservation. The results of the analyses determined that air emissions from each project alternative would produce less than significant air quality impacts to all areas of the project region. In addition, Section 4.4.3 of both the DEIS and FEIS concluded that potential emissions of toxic air contaminants generated by the project training would result in less than significant impacts to public health at all locations within the project region.
AQ-6	3079	The EIS should perform a Prevention of Significant Deterioration (PSD) increment consumption analysis for the Northern Cheyenne Reservation to determine the significance of air quality impacts from the proposed training activities.	The federal PSD requirements only apply to major stationary sources of emissions and not mobile sources, such as the project aircraft. Therefore, the air quality analysis in the EIS did not rely on the requirements of the PSD regulation to determine the significance of project air quality impacts. However, the air quality analysis in the EIS uses the Montana and National Ambient Air Quality Standards (NAAQS) as criteria to determine the significance of project air quality impacts. One of the main objectives of the PSD regulation and increment consumption analysis is to also ensure that proposed major stationary sources do not contribute to an exceedance of a NAAQS. PSD is addressed in Section 3.4.2 of the DEIS and FEIS and the relationship of PSD to the Northern Cheyenne Reservation is addressed in Section 4.4.3 of the FEIS.
AQ-7	3079	Analyze the cumulative impacts of the proposed action to visibility on and near the Northern	Determination of the significance of an activity on visibility in a federal Class I area such as the Northern Cheyenne Reservation

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		Cheyenne Reservation as well as acute visibility impacts from individual jet contrails.	is typically associated with evaluation of stationary source emissions. Nevertheless, Section 4.4.3 of the FEIS has been revised to include an evaluation of cumulative impacts to visibility within the Reservation from the project. The results of the analysis determined that the minimal increases in emissions from the project would not substantially contribute to cumulative visibility impairment within the Reservation. Individual aircraft exhaust trails are composed of particulate matter and organic compounds that dissipate quickly and would not have a lasting effect on visibility. Water vapor from project aircraft emissions that would occur within the higher and coldest altitudes of the atmosphere also could develop into ice crystals and could form contrails. These contrails also would dissipate quickly and would not have a lasting effect on visibility within the Reservation. Therefore, the project would not produce significant impacts to acute visibility within the Reservation or any other portion of the project region.
BI = Biological Resources			
BI-1	1010, 1061, 1069, 1092, 2005, 2069	Animals acclimate to noise and continue producing as under normal conditions.	As explained in both the DEIS and FEIS Sections 3.6 and 4.6, B-1 aircraft have been training in what constitutes PR-2 for several decades. There is no demonstration or claim that this training has affected birthrates or animal reproduction under the airspace.
BI-2	1043, 1082, 2006, 2071, 2092, 2116, 2121	Concern that noise and vibrations will impact animal's fertility and ability to reproduce.	As explained in FEIS Section 4.6.3 and in cited scientific studies, close, loud, sudden noises combined with a visual stimulus produce the most intense reactions for livestock and wildlife. However, given the infrequency of low-level overflight and sonic boom effects at any given location under the airspace, noise and startle effects are unlikely to reach the level at which it would affect animals' ability to reproduce.
BI-3	1100, 1119, 2006, 2021, 2026, 2074, 2100, 2116, 3012, 3039	Concern on the impact to Sage Grouse and may cause it to be listed as endangered.	FEIS Section 3.6.3.3 explains that the greater sage grouse is currently a candidate species. Section 4.6.3 explains that human surface activity has been shown to disturb sage grouse leks.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			Infrequent random overflights or rare sonic booms during ten days of LFEs would not be the type of noise that has been demonstrated to affect sage grouse leks. FEIS Section 2.8.5 quantifies the distribution of chaff and flare residual materials. Such a concentration would not be expected to impact the greater sage grouse.
BI-4	1002, 1007, 1011, 1054, 1056, 1059, 1063, 1083, 1086, 1096, 1097, 1103, 1111, 1115, 2023, 2036, 2044, 2079, 2093, 2099, 3010, 3035, 3041, 3060, 3071, 3079, 3080	Concern of the startle effect on animals and that livestock and wildlife will not acclimate to the noise. Livestock and wildlife could be startled leading to injury or weight loss or cause wildlife to take refuge in other areas or to be driven from a Reservation. Concern for negative impacts during sensitive cattle operations such as branding, calving, or shipping in the spring and fall. Requests to avoid overflight of homes and corrals.	FEIS Section 2.3.1 (4b) presents mitigations and explains that the Air Force would continue the current practice of establishing reasonable temporary avoidance areas when notified by potentially affected individuals. This process is identified in FEIS Section 4.8.3.1. FEIS Section 4.6 describes the startle effects on animals, including threatened and endangered and other special status species. Low-level overflights may elicit a temporary behavioral response in wildlife, such as a change in posture or running a short distance; however, studies have also shown rapid habituation after initial responses in species such as pronghorn, elk, and bighorn. There is no evidence that overflight activity as proposed would drive animals away from a region such as a Reservation. Under the current use of Powder River training airspace ranching and recreational activities including hunting occur with minimal disruption. Overflights may affect but are not likely to adversely affect threatened and endangered species. FEIS Sections 4.6 and 4.9 describe startle effects upon domestic and ranch animals. Although infrequent, startle effects to individual animals could be an adverse impact. As described in Section 4.9 in the event of damage there is an established procedure for claims which begins by contacting Ellsworth AFB Public Affairs.
BI-5	1100, 2026, 3002	Concern with chaff and flare residual materials	FEIS Section 4.3 explains that chaff dispersion is projected to be

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		in pastures near birthing livestock. Suggests chaff and flares are not released at 2,000 feet AGL when cattle and sheep are lambing.	0.00377 ounces per acre annually. Chaff rapidly breaks down and becomes indistinguishable from soil. Section 4.6 explains chaff and flare effects and notes that any contact with chaff or flare residual materials would be highly unlikely. Chaff and flare plastic, Mylar, and/or paper residual materials can be deposited anywhere on the ground. As described in Sections 4.3 and 4.7 these residual materials could annoy people finding and identifying them, but there would be no physical effect on any animals, including birthing animals.
BI-6	1039, 2057	Concern migration patterns will be disrupted. Suggestion for a mitigation measure to limit low-level operations in Powder River 4 during spring and fall bird migration.	FEIS Section 2.3 explains the mitigation measure for Modified Alternative A includes no PR-4 or Gap C Low MOA. Alternative C does not include PR-4 low level overflights. Modified Alternative B includes a PR-4 and Gap C Low MOAs, in which noise impacts would be slightly more intense under the PR-4 MOAs as stated in FEIS Section 4.2.3.2. In other areas, flights at altitudes below 3,000 feet AGL, where most birds migrate, would be random and occur approximately twice per day for 15 to 20 minutes for each mission requiring low-altitude training. There is no reason to believe that this infrequent activity would in any way disrupt migration patterns. FEIS Sections 3.3.3.4 and 4.6.3 address bird strike hazards and potential effects on migratory bird species or migration patterns including along the Central and Mississippi flyways
BI-7	1039, 1113	Shadehill Reservoir, an important waterfowl refuge and staging and over-wintering area for ducks and geese, has been omitted from maps showing surface water.	As a result of the scale of the maps used to present the PRTC and the size of Shadehill Reservoir, the surface water map in the DEIS did not specifically call out the reservoir. The location of that reservoir has now been identified on FEIS Figure 3.5-2.
BI-8	3060	Would like seasonal avoidance areas or other conservation measures to minimize impacts to federally listed threatened, endangered, or candidate species, particularly to reduce impacts to endangered whooping cranes, greater sage-grouse, and Sprague's pipit. A full	FEIS Section 2.3.1 explains that the mitigation measure for Modified Alternative A includes no Low MOA under PR-4 or Gap C, where the possibility of affecting whooping crane is greatest. Modified Alternative C also does not include PR-4 low level overflights or a PR-4 and Gap C MOAs. Modified Alternative B does include PR-4 and Gap C Low MOAs, in which noise impacts

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		analysis on direct and indirect effects from chaff and flare exercises on threatened and endangered species should be considered.	would be slightly more intense than currently as stated in FEIS Section 4.2.3.2. It would be possible to define avoidance measures in consultation with USFWS to avoid impacts on the whooping crane should Alternative B be selected. In other areas, flights at altitudes below 3,000 feet AGL, where most birds migrate, would be random and occur approximately twice per day for 15 to 20 minutes for each mission requiring low-altitude training. Sprague's pipit and greater sage grouse, both candidate species for federal listing, are potentially present over fairly broad areas under proposed project airspace. Analysis of the potential for overflight effects on avian species in Section 4.6.3 of the FEIS indicates a low possibility of adverse effect on these species from the proposed action or alternatives. Section 4.3 of the FEIS explains that chaff dispersion is projected to be 0.00377 ounces per acre annually. Chaff rapidly breaks down and becomes indistinguishable from soil. There are multiple studies which have not found either direct or indirect effects of chaff or flares on biological species (see FEIS Appendices C and D).
BI-9	3060, 3074	Sprague's pipit has been added as an ESA candidate species since the publication of the Draft EIS and needs to be addressed under the Threatened, Endangered, and Other Special Status Species section of the EIS. Sensitive plant and wildlife data for wildlife species at the Little Bighorn Battlefield National Monument and Custer National Forest is incomplete. Recommend preparing a Biological Assessment/Evaluation.	A discussion of Sprague's pipit as an ESA candidate species has been added to FEIS Sections 3.6.3.3 and 4.6.3.1 and included in Tables 3.6-4 and 4.6-1. Information on sensitive plant and wildlife species at the Little Bighorn Battlefield National Monument and portions of Custer National Forest lying underneath airspace that would be used by the project has been reviewed, and Tables 3.6-4 and 4.6-1 have been updated with this information. The updated EIS analyses of Threatened, Endangered, and Other Special Status Species conclude that project elements "may affect but are not likely to adversely affect" threatened and endangered species. The Air Force submitted the updated analysis dated 30 May 2014 (FEIS Appendix E) to the USFWS and received their concurrence as noted in their letter to the Air Force dated 27 June 2014 found in Appendix E of the FEIS.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
CM = Cumulative			
CM-1	2026	The Keystone XL Company plans to install a 36-inch high-pressure pipeline though Harding County.	FEIS Chapter 5.0, Cumulative, includes the pipeline. There is no ground construction associated with the proposed changes in airspace. FEIS Section 2.3.1 explains flare release altitude limitations and overflight avoidance of construction and mining sites where sensitive electronics could be affected. It would be almost impossible for chaff, flares, or electronic emissions to impact any pipeline.
CM-2	1001, 2045, 2083, 3041, 3056, 3060	Would like more discussion regarding threat emitters or other ground assets. Request for information on how additional NEPA analysis would be conducted on the future emitters and notification of whether emitters would be placed within the Little Bighorn Battlefield National Monument viewshed.	The proposed PRTC has no new ground assets. As explained in FEIS Section 2.5.7, new ground-based threat emitters are not part of the proposed action. FEIS Section 5.1 explains that threat emitters, if sited, would have separate NEPA evaluation.
CM-3	2053, 2108	Concern the full impact of the proposal will not be known for several years and that it may be too late to mitigate any impacts once they are known.	As explained in FEIS Section 3.8, the existing Powder River MOAs have a somewhat greater proportion of rangeland and smaller proportion of agricultural land than the entire potentially affected area. Most land use types are represented under existing airspace and have effectively been overflown for decades by B-1 training aircraft at the same altitudes proposed for the expanded airspace. The only differences are tribal land and designated urban land which are not under existing MOAs (See FEIS Section 3.9.).
CM-4	1061	Southeast Montana is being considered for wind energy development with new wind farms on high ridges and plateaus. Future wind turbines may be considered in project's planning phase.	Existing and potential wind farms are considered throughout the analysis, including FEIS Sections 3.8, 3.9, 4.8, and 4.9. Existing wind farms are mapped and avoided, and future wind farms, when approved, would also be mapped and avoided. (See FEIS Appendix J for lighting.) The proposed action would not inhibit the development of future wind farms or other industrial land uses. (See FEIS Section 4.8.)

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
CU = Cultural Resources			
CU-1	1082, 2009	Some towns in the document are misclassified as ghost towns.	All ghost towns beneath the airspace were reviewed; some were found to include permanent resident populations, but are still classified ghost towns. These are noted in Table 3.7-4 of the FEIS.
CU-2	2053, 2057, 2093, 2105, 3031, 3060, 3069, 3074	Concern for disruption of the use or character of cultural, sacred, and historic sites (including newly listed sites such as the Evangelical Lutheran Trinity Church) and activities and protection of those sites and activities, including protecting landscapes, soundscapes, and scenery. Suggests consultation with all tribes and reservations to which Little Bighorn Battlefield National Monument is highly significant. Suggests additional definition of undertaking to allow a survey to be conducted. Concern the analysis does not include impacts to the North Cave Hills, South Cave Hills, or Slim Buttes cultural landscapes in Harding County, SD.	Following consultation regarding the proposed action with ACHP, SHPOs from MT, WY, ND and SD, Crow Tribe, Northern Cheyenne Tribe, Standing Rock Sioux Tribe, Cheyenne River Tribe, FAA and NPS, the Air Force created a modified PRTC proposal ("Modified Alternative A"). The "Programmatic Agreement among 28th Bomb Wing, Ellsworth Air Force Base, the State Historic Preservation Offices of Montana, North Dakota, South Dakota and Wyoming, and the Advisory Council on Historic Preservation Regarding the Proposed Development, Implementation and Operation of the Powder River Training Complex" (FEIS Appendix N) is among consulting parties comprised of signatories (28 BW, SHPOs from MT, ND, SD and WY, and the ACHP) and invited signatories (FAA, NPS, and Crow Tribe). The Cheyenne River Sioux Tribe, Northern Cheyenne Tribe and Standing Rock Sioux Tribe have also been invited to sign, but have not yet elected to do so. The modified alternative and the Programmatic Agreement address areas of avoidance, modes of flying, and procedures for notification regarding special avoidance areas or times for sensitive resources and other communications. Some locations under the ATCAAs and the Gap MOAs would never see low level overflight or, at most could see LFE low level overflight one to three days per quarter up to 10 days per year. Although Section 106 consultation has concluded for the purposes of the EIAP, the Air Force will continue to consult with the tribes and other stakeholders. FEIS Section 3.7 explains consultation conducted by the Air Force, including Government-to-Government consultation. The Section also includes newly listed sites. FEIS Section 4.7 explains the stipulations agreed to in the Programmatic Agreement. FEIS

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
			Section 2.3.1 explains that the Air Force will also work with individuals and organizations to identify sensitive noise areas and periods of avoidance.
CU-3	2083, 2103	Concern the Native American lands are being given more concessions such as avoiding cultural and religious activities.	Modified Alternative A describes changes in airspace use that address cultural resources concerns expressed by all stakeholders, not just Native Americans. FEI*S* Section 3.7 explains that Native American lands have a special relationship requiring Government-to-Government consultations. The Programmatic Agreement described in CU-2 stipulates avoidance, minimization and mitigation procedures available to the signatories, including not only the tribes but the ACHP, the SHPOs and others. Potential environmental consequences to public, private, and tribal lands are all addressed in the FEIS. (See FEIS Section 4.8.)
CU-4	2124, 2142	Would like economic relationship with the Air Force.	The Air Force is willing to explore opportunities to enhance economic relationships with tribes.
DO = Description of Proposed Action and Alternatives			
DO-1	2052, 2121	Would like more clarity on the proposed flying levels of the alternatives.	FEIS Sections 2.5-2.8 describe each alternative's altitudes and estimated time at altitudes for training. Section 2.4 presents the scheduled MOA times and altitudes. Section 4.9 explains the average number of low-level overflights. An average of six to nine low-level overflights of any given location, depending on alternative, is seen as an unavoidable adverse impact. Information would be made available on airspace use for training.
DO-2	2105, 3056, 3060	Would prefer Alternative B or some variation of the preferred alternative that excludes low-level flights-specifically to avoid low-level flights over Little Bighorn Battlefield National Monument, interference with emergency response aircraft flights over the Ashland Ranger District of the Custer National Forest, and least impact to Greater sage grouse in Wyoming and Montana.	FEIS Section 2.3.1 explains mitigations to reduce potential effects on the Little Bighorn Battlefield National Monument. Section 4.3 explains that military training would be halted in the affected airspace due to any ground safety emergency that involves a life-flight. Section 4.8 explains land use impacts. Section 4.6 explains overflight effects on the greater sage grouse.

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
DO-3	1013, 1014, 1015, 1016, 1017, 1018, 1019, 1020, 1021, 1022, 1023, 1024, 1025, 1026, 1027, 1028, 1029, 1030, 1031, 1032, 1033	Would prefer the floor no lower than 5,000 feet AGL and no supersonic flight.	Chapter 1.0 of the FEIS explains the purpose and need for the airspace, the requirement for training down to 500 feet AGL, and the need for realistic battlefield tactics at supersonic speeds during one to three days of quarterly LFEs. Chapter 2.0 of the FEIS describes the alternatives and estimated time airspace would be scheduled for training. MOA segments and multiple MOA have been included to allow for IFR transit.
DO-4	1096, 1114, 2043, 2076, 3001, 3043, 3057	Would prefer the floor no lower than 10,000 to 15,000 feet MSL, particularly in new MOAs.	Chapter 1.0 of the FEIS explains the purpose and need for the airspace, the requirement for training down to 500 feet AGL, and the need for realistic battlefield tactics at supersonic speeds during one to three days of quarterly LFEs. Chapter 2.0 of the FEIS describes the alternatives and estimated time airspace would be scheduled for training.
DO-5	3043, 3057, 3060	Alternative C would have less impact on the economy and quality of life, as well as bird migration routes including the endangered whooping crane.	FEIS Section 2.3.1 explains the mitigation measure for Modified Alternative A includes no PR-4 and Gap C Low MOAs. Modified Alternative C does not include PR-4 low level overflights. Low altitude overflight would be avoided in PR-4.
DO-6	3062	Would like more discussion on Alternatives Considered but not Carried Forward were not further analyzed.	FEIS Sections 2.10 and 2.11 explain selection standards and application of those standards. FEIS Sections 2.10.5.4 through 2.10.5.6 explain the need for training locations that are in close proximity to Ellsworth AFB.
DO-7	2126, 2130, 2132	Requests the proposed eastern border of PR-4 to be modified so it does not overlap tribal lands.	FEIS Section 2.3.1 explains the mitigation measure for Modified Alternative A includes no PR-4 or Gap C Low MOAs. Modified Alternative C does not include PR-4 or Gap C low level overflights. Tribal lands with PR-4 would not be subject to low level overflights with either of these alternatives.
EJ = Environmental Justice			
EJ-1	1039, 1076, 2050	Concern the Air Force is discriminating by acknowledging the tribe's various religious, cultural, and traditional activities and are not making the same concessions to other individuals who have voiced opposition. EO	DEIS Section 3.7 explained that Native American lands have a special relationship requiring Government-to-Government consultations. Potential environmental consequences to public, private, and tribal lands are all addressed in FEIS Section 4.8. As described in DEIS Section 3.10 and Appendix F of the FEIS, EO

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		12898 as described in Appendix F of the Draft EIS, essentially insures the fair treatment of all people regardless of race, color, national origin, or income.	12898 directs that all agencies "To the greatest extent practicable and permitted by law, and consistent with the principles set forth in the report on the National Performance Review, each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States and its territories and possessions" (available at http://www.archives.gov/federal-register/executive-orders/pdf/12898.pdf). See also response to EJ-2.
EJ-2	1009, 1054, 1106, 1108, 2077, 2128, 3014, 3035, 3079	Concern that low-income (or low population) areas under the airspace will become the location used for this proposal. Impacts of the PRTC would be more heavily felt by the tribal community than other groups.	Both the DEIS and FEIS in Section 1.4 and 1.5 discuss the purpose and need of the Proposed Action, including the selection criteria used to choose the locations for implementing the Proposed Action. Reasonable alternatives, modified as a result of public hearings on the DEIS, public comments received, and extensive consultations and special outreach with the public, agencies, and tribal representatives, are presented in FEIS Section 2.3.1. Analysis of the effects of these modified alternatives is presented in FEIS Sections 3.10, 4.9, and 4.10. Section 3.10 quantifies the minority and low-income population and youth population under the airspace. Any person under the airspace, minority or non-minority, could experience an average of one sonic boom per day during the not more than 10 days per year of LFE training. Individuals under the low MOAs could also experience low-altitude overflights of a training aircraft between 500 feet to and including 2,000 feet above the ground. Low-altitude overflights in low MOAs would result in unavoidable uncertainty, startle, and adverse noise impacts. These impacts would apply equally to any minority or non-minority persons regardless of income or age under any of the low MOAs. Modified Alternatives A and C avoid low-altitude overflight of Native American Reservations, including the Northern Cheyenne

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			Reservation, except for portions of the Crow Reservation. Modified Alternative B does not include low-altitude overflight of the Crow or Northern Cheyenne Reservations but does include low altitude overflight of portions of the Cheyenne River and Standing Rock Reservations. Section 4.10 explains that low-altitude training in PR-1A, PR-1C, and PR-1D MOAs overlie portions of the Crow Reservation that have a minority population in excess of 50 percent. An adverse impact not adequately or acceptably mitigated, which cannot otherwise be avoided, presents the potential for a disproportionately high and adverse human health or environmental effect on that population. Under Modified Alternatives A and C, implementation of the mitigations identified in this EIS, including those developed through extensive consultations and outreach with the affected populations to resolve adverse effects under the NHPA, would adequately or acceptably mitigate adverse impacts to such a degree that they are not significant under applicable standards. Consequently, these modified alternatives in conjunction with specified mitigations would not result in disproportionately high and adverse human health or environmental effects for environmental justice purposes.
GE = General			
GE-1	1010, 1040, 1041, 1042, 1061, 1062, 1065, 1069, 1072, 1075, 1077, 1090, 1092, 1110, 2002, 2003, 2005, 2012, 2038, 2065, 2069, 2087, 2098, 2120, 2122, 2123, 2136, 3009, 3013, 3015, 3016, 3017, 3018, 3019, 3027, 3034, 3038, 3055	In support of the proposal.	Thank you for your interest and participation in the NEPA process. Your comment has been entered into the record.
GE-2	1002, 1003, 1004, 1005,	Not in support of the proposal. In favor of the	Thank you for your participation in the NEPA process. Your

	1006, 1009, 1011, 1012, 1034, 1035, 1036, 1037, 1039, 1043, 1045, 1046, 1047, 1049, 1050, 1051, 1052, 1053, 1054, 1056, 1058, 1063, 1065, 1073, 1084, 1085, 1086, 1089, 1093, 1094, 1096, 1104, 1106, 1108, 1111, 1116, 1118, 2017, 2033, 2053, 2054, 2058, 2062, 2071, 2072, 2076, 2080, 2082, 2083, 2090, 2091, 2092, 2093, 2106, 2107, 2108, 2119, 2121, 2124, 2126, 2127, 2128, 2129, 2131, 2132, 2133, 2135, 2138, 2139, 3004, 3005, 3010, 3011, 3012, 3020, 3022, 3025, 3033, 3035, 3036, 3039, 3042, 3050, 3051, 3052, 3054, 3056, 3059, 3060, 3063, 3067, 3078, 3079, 3080	No Action Alternative.	comment has been entered into the record.
GE-3	1046, 1064, 1085, 1093, 1105, 2008, 2067, 3065	Statements that the proposal is unfair, unnecessary, present an unreasonable burden on people affected, and undeserved by the people affected. Concern the Air Force proposal is unjustified for training requirements.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal. The environmental process described in Section 2.12 of the FEIS is designed to include public and agency perspectives for review by decision-makers. Section 2.4 describes the proposal, and Section 1.2 describes the reason for the training requirements. Sections 2.10.4 and 2.10.5 explain the limitations on current training. The screening criteria for identifying alternative training locations are described in Section 2.11.

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
GE-4	2009	Comment that the Ellsworth Task Force has not volunteered Rapid City to be overflown.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal. Your comment has been included in the FEIS, which will be considered before the Air Force makes a final decision.
GE-5	1004, 1009, 1051, 1063, 2011, 2029, 2046, 2070, 2074, 2100, 2127, 3070	Concern the Air Force and FAA will disregard the public comments and taxpayers to get what they want and forget the meaning of 'good neighbor'. Statements that the Air Force is not trusted due to denial of negative impacts in the past and lies and broken promises from other government agencies, Concern for too much government interference near food and livestock production. Suggestions for annual meetings between Air Force and citizens to listen to local concerns and give local residents a chance to listen to Air Force concerns.	FEIS Section 2.3.1 describes the mitigations incorporated into the PRTC proposal in direct response to public and agency concerns. This includes advanced notifications to the public of LFEs. The Record of Decision (ROD) will be legally binding. Any and all mitigations contained in the ROD will become the legal obligation of the Air Force. With the execution of the Programmatic Agreement, in particular stipulation #VII, the Air Force would provide a summary report detailing the training activities held and other issues. The Air Force has programs designed for community relations, including the Mid-Air Collision Avoidance program. Under this or another suitable program, the Air Force will consider all requests for meetings in communities beneath the proposed PRTC airspace. The Air Force will monitor the effectiveness of these programs through the mitigation and monitoring program to be established as part of this proposal.
GE-6	1093, 2009, 2116	Concern the military is trying to instill fear in the American people and looking for wars to fight to get what they want.	The purpose of the proposed PRTC is to provide the best training possible for aircrews. FEIS Sections 2.10.4 and 2.10.5 explain the limitations on current training. The selection criteria for identifying alternative training locations are described in FEIS Section 2.10 and 2.11.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
GE-7	1039, 2015, 2031, 2054, 2139, 3014	Questions the sovereignty of the U.S. government for airspace above private property. "Reasonable and ordinary use is the airspace above your property" is often litigated and routinely protected as a property right. Resolution adopted by the Standing Rock Tribe in 2008 states the use of the airspace was reserved for the tribe pursuant to the Treaties of 1851 and 1868 at Fort Laramie.	FEIS Section 1.6 explains that navigable airspace is under the jurisdiction of the FAA.
GE-8	1007, 1036, 1083, 2015, 2031, 2044, 3043	Concern that a live person at the base cannot be reached to handle complaints, questions, or damage claims. Whom do we contact for rapid response? Previous attempts to resolve a complaint have received a poor response or damage claims are not paid.	The Air Force Public Affairs Office is charged with the responsibility of handling public inquiry. FEIS Sections 2.8.5.2 and 3.3.3.2 identify the process for addressing claims.
GE-9	1004, 1040, 1041, 1054, 1062, 1087, 1088, 1097, 1107, 1112, 2034, 2044, 2045, 2047, 2048, 2068, 2072, 2076, 2088, 2094, 2097, 2100, 2117, 2120, 2123, 2134, 2136, 2142, 3013, 3015, 3024, 3030, 3046, 3071	Supports a well-trained military and supports its mission.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal.
GE-10	2039, 2072, 2121	Can a test-run be done first for feedback before charting the MOAs? Are there any procedures to suspend it or modify it once the airspace is charted if there is a problem?	There is no provision for a test-run of MOAs in the applicable FAA requirements. However, the area under PR-2 has been overflown by B-1 and other training aircraft for many years. FEIS Section 2.3.5 describes the process, after adoption of mitigations to monitor the effectiveness of the mitigations to determine the need, if any, for adjustments.
GE-11	1041, 1042, 1077, 1096, 1097, 1107, 2041, 2091, 2094, 2098, 3006, 3007,	Would like to work together with the Air Force to maintain all missions. Must address the needs of all airspace users. Monitoring and	To the address the needs of all airspace users and other stakeholders, as expressed during public outreach, agency review and tribal consultation, Air Force developed many

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
	3008, 3013, 3037, 3050, 3052, 3053, 3056, 3060	evaluation of the Proposed Action should be ongoing. Previous coordination with stakeholders may have led to additional alternatives but the Air Force was unwilling. Requests for the Air Force to coordinate the development of an alternative.	mitigations, which are listed in FEIS Section 2.3.1. FAA Order 7400.2 states: "Although the FAA must protect the public's right of freedom of transit through the airspace, full consideration shall be given to all airspace users, to include national defense; commercial and general aviation; and space operations."
GE-12	1057, 3032	Requests information on the proposal.	Individuals who requested copies of the EIS have received copies. FEIS Section 1 describes the reason for the training requirements and Section 2.2 describes the components of the proposed airspace. FEIS Section 2.10.5 identifies the limitations on current training. The selection criteria for identifying alternative training locations are described in FEIS Section 2.11.
GE-13	1068	Who conducted the studies discussed in the document?	The FEIS provides the list of preparers for the technical analysis in Chapter 7.0, and lists the reference studies used in this analysis as well as the sources of those studies in Chapter 6.0.
GE-14	3037, 3078	Do not support non-LFE portion of the proposal. LFE use of the airspace appears manageable but non-LFE use impacts a large volume of airspace on a daily basis and will put burden on hundreds of civil aviation and non-DoD flights every day.	As described in Chapter 1.5 of the FEIS, the Air Force needs additional airspace for realistic, high-quality, local training in addition to LFE training. The Air Force worked closely with the FAA to address impacts to commercial traffic. FEIS Section 2.3.1 describes the mitigations to address public and agency concerns.
GE-15	3060	The footnote for Table 3.2-3 should include "Federal Aviation Administration Advisory Circular, FAA AC-91-36D)."	FAA AC-91-36D recommends no overflight below 2,000 feet AGL over the Little Bighorn Battlefield National Monument. A mitigation has been incorporated into the proposal (see FEIS Section 2.3.1).

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
GE-16	3062	Would like a discussion on BRAC commission voting to retain Ellsworth AFB and its B-1 fleet without determining its current airspace could meet its mission needs.	A response is unnecessary because the comment raises a concern which is outside the scope of the proposed action nor does the comment address the adequacy of the DEIS or the merits of alternatives discussed in it. The BRAC Commission report can be found at http://www.brac.gov/finalreport.html.
LU = Land Use			
LU-1	1011, 1039, 1045, 1063, 1076, 1098, 1108, 1109, 1111, 2013, 2032, 2033, 2048, 2083, 2099, 2103, 2111, 2116, 2130, 3039, 3048, 3080	Concern the quality of life, privacy, and integrity of the land would be impacted. Wants the integrity and stewardship of the land and quality of life maintained.	FEIS Sections 3.8 and 4.8 explain the existing land use and potential consequences, and Sections 3.9 and 4.9 explain the social and economic relationship of the people, communities, and land. Section 4.9 describes the estimated average extent of overflight at low altitudes and the mitigations are described in Section 2.3. Section 4.8 describes the consequences to different land uses, including private and public lands. Some individuals expressed the perspective that any low level training would be an adverse impact.
LU-2	1037, 1043, 1045, 1046, 1050, 1056, 1059, 1074, 1078, 1080, 1082, 1103, 1106, 1108, 1111, 1113, 2013, 2030, 2035, 2045, 2050, 2067, 2071, 2077, 2080, 2105, 2108, 3010, 3011, 3041, 3044, 3060, 3069, 3080	Concerned about the sudden overflight and noise impacts to the serenity of the land and people's way of life including recreation. Permanent avoidance areas may be needed.	FEIS Sections 3.2 and 4.2 explain the existing conditions and noise consequences. Section 4.9 describes the estimated average extent of low-level overflight and potential startle effect. The Air Force has incorporated mitigations, including establishment of reasonable temporary or seasonal avoidance areas or other measures identified in Government-to-Government consultation with affected tribes (see FEIS Section 2.3). Some individuals see military training and related startle or noise impacts as unacceptable to their quality of life and an adverse impact.
LU-3	1035, 1074, 1094, 1105, 2006, 2035, 2048, 2132	Concerns the proposal will damage or eliminate ranches/farms and the ranching/farming lifestyle.	FEIS Section 4.8 explains that B-1 training aircraft have overflown ranches and farms under the existing Powder River A and B MOAs (which are essentially PR-2) for decades. The ranching/farming/hunting lifestyle continues under this airspace and, in many ways, the ranches and farms are comparable to, or the same as, ranches and farms under the proposed additional airspace. FEIS Section 4.9 explains that the average number of low-level overflights per year would be approximately six to

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			nine. This level of training activity could cause annoyance but, based upon the experience under the existing MOAs, would not significantly impact ranches, farms, or the ranching lifestyle. Individuals under the proposed airspace could see sudden overflight startle impacts as a significant impact.
LU-4	2045, 3026	Crop land acres have not been adequately identified in the analysis. Does not account for crop acres coming out of the Conservation Reserve Program (CRP).	FEIS Section 3.8 lists agricultural land area from available GIS data under the existing Powder River MOAs and under each proposed MOA. Section 4.8 explains why the proposed PRTC would not adversely affect land use under the airspace.
LU-5	2046, 2113, 3074, 3079	Concern of losing prime hunting areas.	FEIS Section 4.8 describes the importance of hunting land use under the proposed airspace. Section 4.9 explains an average of six to nine low-altitude overflights could occur per year in any given location under a low MOA. Prime hunting areas are located under the existing Powder River A and B MOAs (essentially the same as PR-2) where B-1s have been training for decades. Section 4.8 explains that low-altitude training and hunting coexist throughout the west.
LU-6	2130	The land use numbers are not shown on the maps and can't see on the maps how much acreage is included in the area.	In FEIS Section 3.8, Table 3.8-2 presents land use numbers calculated using geographic information systems. GIS data do not always coincide; however, the overall land use numbers presented in the report represent the best available information.
LU-7	1061, 1062, 2069, 3009	Property is under the current airspace or overflown by aircraft near Minot. No observable negative impact. Ranchers have requested no-fly zones during sensitive times for livestock with a phone call to Ellsworth AFB.	FEIS Section 4.8 explains that aircraft have overflown what is effectively the proposed PR-2 for decades. Section 2.3.1 explains that the Air Force will continue to work with ranchers to establish avoidance areas through identified mitigation measures.
LU-8	2074	Question if the Air Force adheres to county land use plans. Statement that individual county land use plans should be taken into consideration in the EIS analysis.	FEIS Section 4.8.1 explains that PRTC would not place restriction on land use or land use plans. Plans for energy development or related structures which could project into the airspace are considered in Section 4.9. (See also FEIS Appendix J.)
LU-9	2121, 2143, 3060, 3079	Concerned about the visual effects of large aircraft flying over, contrails, and chaff and flare	FEIS Section 4.9 describes the estimated average frequency of low-flying aircraft. Sudden overflight visual and startle impacts

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		debris.	from aircraft and rare visual impacts from residual pieces of chaff or flares are adverse impacts. Aircraft emissions associated with the use of proposed airspace would not impact visibility (FEIS Section 4.4.3.1 and Section 5.1.2.1.4). At lower altitudes, individual aircraft exhaust trails can be visually detected for a brief period due to emissions of particulate matter and organic compounds. Below 3,000 ft AGL, these exhaust emissions rapidly dissipate (see FEIS Section 4.4.3.1). Contrails, or condensation trails, are an existing condition above the proposed PRTC airspace. Contrails are visible water vapor trails from aircraft engines associated with specific meteorological conditions and produced by high-altitude aircraft overflight. Commercial overflights of the four-state region are the primary contributors to these temporary artificial clouds. Overflight of military training aircraft could create condensation trails depending on flight altitude and meteorological conditions. Although contrails could be seen as an intrusion into an otherwise clear sky, such contrails, whether formed by commercial or military aircraft overflight, would not have an adverse effect upon tribal or other lands under the proposed airspace. By eliminating military flights above FL260 the Modified Alternatives would greatly reduce the potential formation of contrails. Effects of the visual intrusion of PRTC training activities on historic properties are addressed in FEIS Section 4.7.2.1.
NA = Native American			
NA-1	2053	Concern the consultation with the tribal governments will be labeled simply a fiduciary responsibility. There is no guarantee that comments will be implemented.	Ellsworth AFB has conducted Government-to-Government consultations with tribal governments and explained all aspects of the proposed airspace changes. Over the course of the past six years, Ellsworth AFB has consulted with tribal governments in compliance with Section 106 of the NHPA, and invited the tribes to be signatories to a Programmatic Agreement that includes stipulations specifying measures that resolve tribal concerns.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			The Air Force will also continue to consult with the tribes on a Government-to-Government basis.
NA-2	2103, 3043	Separate and private hearings were conducted at the reservations and comments were not submitted specifically to aeronautics commission. Concern the tribal governments comments will not be made available or included in the Final EIS.	All written comments and transcripts received on the DEIS are included in the FEIS. (See Section 2.12). The FAA is a cooperating agency (see Section 1.6) in this EIS and has participated in the public hearing process. The FAA reviewed the EIS and related appendices and, subsequent to the Air Force Record of Decision (ROD), the Air Force anticipates that the FAA will adopt the FEIS, issue its own ROD and then publish the new airspace in the Billings Sectional Aviation Chart.
NA-3	2053	Concern the tribal government is not recognized as having a legal or constitutional relationship with the United States.	Ellsworth AFB has made special efforts to conduct Government-to-Government consultations with tribal governments as was described in DEIS Section 3.7. The obligation for federal agencies to engage with Native American tribes on a Government-to-Government basis is based on federal, statutes, executive orders (EOs), regulations, and policies. These include NHPA of 1966, the Native American Religious Freedom Act, Presidential Memorandum on Government-to-Government Relations (April 29, 1994), EO 13007 (Indian Sacred Sites) and EO 13175(Consultation and Coordination with Indian Tribal Governments), and DoD Instruction 4710.02 (DoD Interactions with Federally Recognized Tribes). These consultations, between Ellsworth AFB and the tribes, have included explanations of all aspects of the proposed airspace changes, and have resulted in some of the changes made in Modified Alternative A. As described in FEIS Section 4.7, the Air Force has executed a Programmatic Agreement that stipulates measures that resolve adverse effects to historic properties, religious ceremonies and important tribal events under the PRTC (refer to Appendix N). Furthermore, the Air Force will continue to consult with the tribes on a Government-to-Government basis.
NA-4	2053, 2054, 2055, 2132, 3060, 3071, 3079	The importance of the Native American ceremonies and religion is not adequately identified or analyzed in the Draft EIS. Military	DEIS Section 3.7 explained the importance of ceremonies and Government-to-Government consultation. FEIS Sections 2.3 and 4.7 explain the provisions of the Programmatic Agreement,

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		interference with and encroachment of sacred rights and religious practices is offensive, distracting, disrupting, and disrespectful. Ceremonies take place throughout the year-not just spring and summer. Suggestion for further consultation with affected tribes including tribes which conduct ceremonies at Little Bighorn Battlefield National Monument.	which includes avoidance areas and times, and specifies that when Native American ceremonial and religious sites are identified, the Air Force will consult to determine reasonable avoidance altitudes and times. Further consultation has resulted in the mitigations described in FEIS Section 2.3.
NA-5	2053, 2143, 3071	Suggests mitigations for no training during ceremonies throughout tribal homeland and over sacred grounds. Suggests no low-level overflights or sonic booms over Standing Rock Indian Reservation from June-August.	FEIS Sections 2.3 and 4.7 explain that during Government-to-Government consultations, the Air Force explained that when Native American ceremonial and religious sites are identified, the Air Force will consult to determine reasonable avoidance altitudes and times. Also, as discussed in FEIS Sections 4.7.2.1, and 4.7.2.3, a "Programmatic Agreement among 28th Bomb Wing, Ellsworth Air Force Base, the State Historic Preservation Offices of Montana, North Dakota, South Dakota and Wyoming, and the Advisory Council on Historic Preservation Regarding the Proposed Development, Implementation and Operation of the Powder River Training Complex" (Appendix N) is among consulting parties comprised of signatories (28 BW, SHPOs from MT, ND, SD and WY, and the ACHP) and invited signatories (FAA, NPS, and Crow Tribe). The Cheyenne River Sioux Tribe, Northern Cheyenne Tribe, and Standing Rock Sioux Tribe have also been invited to sign, but have not yet elected to do so. As explained in FEIS Section 2.3.1, Modified Alternatives A and C include a minimum training altitude of 12,000 feet MSL above the Standing Rock Indian Reservation, Cheyenne River Sioux Tribe, and Northern Cheyenne Indian Reservations. Supersonic training would be scheduled once per quarter for 1 to 3 days for a maximum of 10 days per year. An average of one sonic boom per LFE day could be experienced at any given location under the proposed airspace.
NA-6	2053, 2103, 2139, 3071	Request for more information on the frequency and amount of fuel or chaff dropped and flight	FEIS Section 2.3 explains that there is no proposed deployment of ordnance on tribal lands or any other lands under the

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		time over tribal lands. Suggestion to limit the use of chaff over tribal lands and start using new technologies for invisibility.	airspace. The Air Force has identified fuel jettison areas and none are over tribal lands. FEIS Section 2.8 describes chaff and flare deployment as defensive countermeasures and explains the quantity of chaff (0.00377 ounces per acre per year) or flare residual materials (one plastic or Mylar piece per 149 acres per year) which could be randomly distributed anywhere under the training airspace, including on tribal lands. FEIS Section 2.8 also contains information on the frequency of aircraft use of the airspace as part of the Proposed Action.
NA-7	2054, 2056, 2057, 2058, 2129, 2130, 2140	Concern there is not enough respect for the Native American lands and their quality of life.	The Air Force has sought to work with Native American tribal representative to identify sensitive sites. DEIS Section 3.7 explained the importance of ceremonies and on-going Government-to-Government consultation. FEIS Section 4.7 explains that when Native American ceremonial and religious sites are identified, the Air Force will consult to determine reasonable avoidance altitudes and times.
NA-8	2053, 2055, 2058, 2124, 2139	Concern the proposal is in violation of treaties, specifically the Fort Laramie Treaty of 1868, for the absolute and undisturbed use and occupation of tribal lands. Suggestions that these treaties include airspace over tribal lands	DEIS Section 3.7 described the Fort Laramie Treaty of 1868. There is no ground construction proposed as part of the Powder River Training Complex. FEIS Section 1.6 explains that the FAA has sole responsibility of navigable airspace in the United States and associated offshore and other areas.
NA-9	2124, 2126, 2131, 2132, 2137, 2140, 2141, 2143	Were the meetings with the Native Americans Government-to-Government meetings? If not, why weren't they advertised as public hearings? Thought the purpose of the meeting was for the Air Force to give a presentation and was not going to include public comment or a court proceeding hearing. If a public hearing had been advertised more people would have attended.	Meetings with tribes are conducted on a Government-to-Government basis. Meeting participants are invited at the direction of the tribe. Such Government-to-Government meetings are in addition to advertised public hearings on the DEIS. (See DEIS Section 3.7.) The results of Government-to-Government consultations have been incorporated into the analysis as described in FEIS Sections 4.7, 4.10, and others.
NA-10	3079	Concerned about the sudden overflight and noise impacts to the serenity of the land and Native American way of life. Permanent	FEIS Section 2.3 explains the mitigations incorporated to support reasonable seasonal and temporary avoidance areas. Also FEIS Section 4.7.2.3 describes the stipulations of the Programmatic

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		avoidance areas may be needed.	Agreement the Air Force has executed, including avoidance areas, times and dates, and a process for continued consultation as specific concerns arise regarding additional identification of Native American ceremonial and religious sites or other areas of concern. The Air Force will consult to determine reasonable avoidance altitudes and times. See Appendix N for the full text of the Programmatic Agreement.
NA-11	2124	Suggests a Memorandum of Agreement as part of a Government-to-Government relationship between the tribes and the Air Force.	Modified Alternative A incorporates a number of changes in airspace use in response to tribal concerns. Also, as described in FEIS Section 4.7.2.3, the Air Force, SHPOs and ACHP developed a Programmatic Agreement that resolves adverse effects that could result from the proposed action, through stipulations concerning avoidance, minimization or mitigation of adverse effects to historic properties, religious ceremonies and important tribal events under the PRTC. Refer to FEIS Appendix N for the complete and final text of the Programmatic Agreement.
NA-12	3071	History of Native Americans portrayed in the DEIS includes incorrect information. Suggested corrections are provided.	Additional edits incorporated into the EIS in response to specifics provided by the tribes.
NA-13	2124	Concern for illegal dumping of hazardous materials, chemical, nuclear, and other waste is being dumped.	As explained in Chapter 2.0 of the FEIS, no ground construction is included as part of the Proposed Action. Chapter 5.0 of the FEIS explains that threat emitters, if sited, would have separate NEPA evaluation. There are no proposed ground assets and no proposed construction or other wastes.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
NO = Noise			
NO-1	2008	Concern with the noise increase from aircraft in holding patterns waiting to land.	As described in Section 2.5 of the FEIS, although the sorties may increase from FY2011 activity, total flight operations would not be expected to exceed those analyzed and published in the 2008 Ellsworth AFB Air Installation Compatible Use Zone (AICUZ), which is publically available at http://www.ellsworth.af.mil/shared/media/document/AFD-090428-076.pdf. The AICUZ study, which is incorporated by reference, identifies the noise levels associated with flight operations in the vicinity of Ellsworth AFB.
NO-2	1038, 1103, 1111, 2008, 2105, 3060, 3069, 3074	Concern for the disruptive nature of sonic booms and low-level overflights including startle effect and damage to buildings, windows, and other property.	As described in FEIS Section 4.2, low-level overflights and sonic booms would be infrequent. Overflights exceeding 65 dB SEL would occur once on 4 out of 10 days on average. An average of one sonic boom per day could be experienced on the not more than 10 LFE days per year. Startle effects generated by noise would be relatively rare, and the likelihood of significant structural damage from a sonic boom is very low, although it could occur. Any claims from Air Force-related damage would begin by contacting Ellsworth AFB Public Affairs.
NO-3	1115, 2008	Concern for the accuracy and scientific integrity of the B-1 aircraft noise predictions. Concern the effects are underestimated. When the B-1s use their afterburners, the noise is greater than reported.	FEIS Appendix I describes the noise models and accuracy of those models. DEIS Section 3.2 described the noise from B-1 afterburner use, and Appendix I, Table I-1, presents the noise level without afterburners. The numbers are measured numbers. FEIS Section 4.8 presents the consequences of SEL noise.
NO-4	1039, 1056, 1082, 2009, 2110, 3060, 3080	The noise numbers are misleading and vague because they are averages and generalized. They are not always consistent. No specific discussion is provided as to how thresholds of significance were defined in determining impacts of noise on the resources described in the document. The 55 DNL dB threshold cited in the DEIS does not adequately address	Section 3.2 of both the DEIS and FEIS explain that both average and single event level noises are included to provide a complete noise picture to the public, agencies, and decision-makers. FEIS Appendix I explains FAA noise policies. DEIS and FEIS Section 3.2.2 discussed factors involved in defining significance with regards to noise impacts.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		disruption of tranquility or disruption of solitude at national parks. No specific discussion is provided as to how thresholds of significance were defined in determining impacts of noise.	Neither the Air Force nor the FAA has specific significance thresholds for properties like the Little Bighorn Battlefield National Monument, which call for special consideration in determining noise impacts (see DEIS Section 3.2.2). Noise impacts on such properties are determined based on the context and intensity of the impacts on the resource on a case-by-case basis. FEIS Section 4.2.3 includes specific noise results for the National Monument, using single-event metrics (i.e., SEL and L_{max}) in addition to DNL. In a Programmatic Agreement under Section 106 of the National Historic Preservation Act (see Appendix N of the FEIS), the Air Force and the National Park Service have agreed that the Air Force will partially mitigate the effects of the PRTC on the National Monument (e.g., noise) by implementing specific measures, including a minimum training altitude of 5,000 feet AGL from one hour before to one hour after posted hours of operation.
NO-5	1003, 1037, 1045, 1078, 1096, 1109, 2017, 2021, 2023, 2030, 2032, 2067, 2085, 2092, 2110, 2111, 3048, 3064, 3079	Concern with the increase in noise, including sonic booms and vibrations, with low-flying aircraft and impacts to sleep, hearing, startle effects to humans and wildlife, annoyance, prayer, ceremonies, and other day-to-day activities. Suggestions for limitations set on aircraft noise including restrictions of noise to reasonable hours. Suggestions for analysis to use single-event noise rather than using average noise.	FEIS Section 2.5 describes training periods and the hours when training could occur. After dark flights are required for realistic training. FEIS Section 4.2 describes noise impacts, including sonic booms, and presents the change in average noise levels. FEIS Section 4.2 identifies the calculated number of times per training day when different sound levels would be exceeded. FEIS Section 4.2 also explains that individual aircraft operating at low altitude may have single events as loud as 133 dB sound exposure level (for a B-1 using afterburners at 500 feet AGL). As explained in FEIS Section 4.7.3.1, training aircrew avoid buildings during this fly-up maneuver. Supersonic would be proposed above 20,000 feet MSL for bombers and above 10,000 feet AGL for fighters. FEIS Section 2.8 describes the minimum altitude for supersonic maneuvers. FEIS Appendix I explains noise measures in more detail.
NO-6	2018	Does altitude have a factor in the decibels of noise reaching the ground?	DEIS Section 3.2 and FEIS Section 4.2 provide noise effects based upon aircraft altitude above ground level. This means that an aircraft flying at 10,000 feet MSL above 3,000-feet MSL terrain

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			would have a noise effect comparable flying at 7,000 feet AGL.
NO-7	2018	Are there any ultrasonic magnetic waves involved in sonic booms?	DEIS Section 3.2 and Appendix I of the FEIS explain that sonic booms are created by sound pressure waves, not magnetic waves. There are no ultrasonic magnetic waves involved in sonic booms. The compression of air does result in sound effects beyond those audible to the human ear. Some sounds inaudible to humans can be heard by animals.
NO-8	2018	What would the decibels be at 10,000 feet AGL?	FEIS Appendix I, Table I-1 and I-2 describe the decibel levels for different aircraft types flying at different altitudes AGL. FEIS Section 2.11 presents sonic boom overpressures for various altitudes AGL. FEIS Section 4.2 provides noise effects based upon aircraft altitude AGL. This means that an aircraft flying at 10,000 feet MSL above 3,000-feet MSL terrain would have a noise effect comparable flying at 7,000 feet AGL.
NO-9	2101, 3079	There are several different units used to describe noise. Want to see single event sound exposure levels. How do decibels relate to psf? How can we understand the meaning of the sound measurements?	DEIS Section 3.2 explained that different noise measures are used to reflect different noise effects. FEIS Appendix I explains noise measures in more detail and Table I-1 provides typical noise levels for common sounds. Both average noise and single event sound exposure level noise are included in FEIS Section 4.2 to provide a complete picture to decision-makers and the public.
NO-10	1007, 1042, 1110, 2045, 2107, 3008, 3016, 3017	Do not want flights over homes or corrals also suggest avoidance areas similar to those given to Native American sacred grounds to include round-up areas, birthing areas, watering holes, etc. Not all the sensitive noise areas have been identified and want assurance all avoidance areas will be respected.	FEIS Section 2.3 explains that the Air Force will work with individuals, tribal governments, and organizations to identify sensitive noise areas and periods of avoidance.
NO-11	2112, 2116, 3064	Concern for the noise effects associated with Post Traumatic Stress Disorder and other health issues.	FEIS Section 4.2 describes studies conducted regarding performance effects of noise and other noise-related issues.
NP = National Environmental Policy Act			
NP-1	1009, 1064, 1068, 1074,	Questions if citizens can vote down the	Section 1.5 explains that the FAA has jurisdiction over navigable

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
	1096, 1117, 2024, 2032, 2071, 2125, 3012	proposal or sue the Air Force. Concern the Air Force can do this without the consent of citizens and is an infringement on citizens' rights. Suggests the Air Force is ignoring the concerns expressed by citizens.	airspace. FEIS Section 2.10 explains that federal environmental and airspace regulations will be followed in the decision-making process.
NP-2	1068, 1076, 2032, 2043, 2050, 2083, 2124, 2132	Concern that comments and objections are not being listened to and that elected officials are not representing citizen concerns. Hope that recommendations will be added in the Final EIS.	FEIS Section 2.10 explains that federal environmental and airspace regulations will be followed in the decision-making process. Section 2.10 also explains the opportunities for public concerns to be incorporated into the decision-making process.
NP-3	1071, 2047, 2068, 2107, 2108, 3044, 3048	Appreciation for the holding public hearings and providing a venue to provide comments and learn more about the proposal.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal.
NP-4	2050, 2074, 2083, 2094	What is the role of the cooperating agency and do they work in our best interest? Suggests that a state law that gives Montana the role of cooperating agency and that the Air Force should coordinate with the state. Statement that as the cooperating agency and final authority, the FAA has the most influence in the decision.	FEIS Section 1.6 of the FEIS explains that FAA is the cooperating agency and will make decisions regarding establishing airspace.
NP-5	2057, 2072, 3066, 3072	How long is the comment period for the Draft EIS? Does the FAA see our comments?	Section 2.12.2 of the FEIS describes the DEIS public comment process and Section 2.12.3 of the FEIS describes the environmental process. The initial comment period opened on August 20, 2010 and was scheduled to end on November 15, 2010, but by request, the comment period was reopened and extended to January 31, 2011, nine weeks beyond the original timeline. Closure of the comment period for the DEIS was described in the public announcements. (See Appendix E.) FAA reviews the FEIS and determines whether to adopt it. Section 1.6 of the FEIS (Section 1.5 of the DEIS) explains that FAA is a cooperating agency and will make decisions regarding establishment of any airspace.

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
NP-6	2064, 3047	Can the Air Force and the FAA cooperating agency provide a commitment that will not limit wind energy projects?	FEIS Section 4.9.3.1.4 discusses towers and FAA requirements for tall structures.
NP-7	1012, 2066, 3073	If this goes through, can we ensure compliance with the project ROD? Concern the Air Force won't abide by their own rules.	The FEIS and ROD will be legally binding. Any and all mitigations contained in the ROD will become the legal obligation of the Air Force. (See Section 2.10.)
NP-8	1108, 1116, 1117, 2072, 2095, 2116, 2123, 2130, 2141, 3025	How were the meetings advertised? How was the public made aware of the proposal? Concern the meetings were not publicized widely enough or early enough to allow people to attend.	Section 2.12.2 of the FEIS describes the DEIS public comment process and the methods used to advertise meetings. In addition, Appendix E of the FEIS describes the advertising for the 19 public hearings and four Native American meetings held during the public comment period.
NP-9	1009, 2075, 2101, 3012	The language in the document seems vague, such as "expected to", "may be", "approximate", as well as using different units of measure.	DEIS and FEIS language reflects the predictive nature of the analysis conducted to identify potential effects of the action on future conditions. Measurement units in the DEIS and FEIS are similar to those used in other NEPA documents and when possible are consistent throughout the document, but are tied to the type of measurement being made. For example, measurements involving airspace use nautical miles, and measurements of ground areas are reported in acres or square miles. (See also response to NO-9.)
NP-10	2083, 2130, 3048, 3056, 3076	What is the process of government consultation? Would like to see other agencies/entities/citizens involved in the comment process and what their comments are. Will a Memorandum of Understanding be created amongst all agencies possibly impacted?	FEIS Section 2.10 explains the NEPA process. DEIS Section 3.7 explained the Government-to-Government consultation. FEIS Appendix E explains other agencies and entities which have been invited to participate in the NEPA process. Appendix E also identifies the public hearing locations and times to support participation by any and all involved parties.
NP-11	1039, 1045	This proposal does not follow Air Force Policy Directive 32-70 or EO 11991 in protecting or enhancing the environment. Concern the EIS is swayed towards the needs of the Air Force not	FEIS Section 2.10 identifies the policies and directives followed in the preparation of this EIS. Section 2.11 identifies one of the goals to be reduced environmental conflicts. Section 2.3 provides a list of mitigations.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		for the concern of the environment.	
PN = Purpose and Need			
PN-1	1059, 2003, 2065, 2097, 3045	Aircrews need to be combat ready and additional airspace is needed.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal.
PN-2	1002, 1003, 1004, 1009, 1011, 1034, 1037, 1046, 1050, 1056, 1058, 1063, 1064, 1065, 1067, 1068, 1073, 1084, 1085, 1093, 1096, 1098, 1101, 1102, 1107, 1109, 1111, 1118, 2006, 2024, 2046, 2047, 2048, 2076, 2077, 2083, 2086, 2092, 2095, 2100, 2101, 2102, 2106, 2109, 2113, 2117, 2121, 2122, 2128, 2134, 3003, 3012, 3014, 3016, 3017, 3018, 3028, 3056, 3080	Why can't you train somewhere else such as Nevada, Utah, the Hays MOA, in deserts, or over water? Why do you need the entire area? Suggests keeping flights in South Dakota and North Dakota. Other planes who want to use the airspace will have to use fuel to get here. Concern there is already enough disruption from military flights and substantial restricted areas already in place. The existing airspace is large enough.	FEIS Section 2.10 describes the training requirements and limitations for B-1 and B-52 aircraft. Section 2.11 explains how the training location alternatives have been identified. Section 2.11 explains that training in other locations is done to the extent possible. Other aircraft are included in LFE training (See Section 2.8). Section 1.0 of the FEIS discusses the purpose and need of the Proposed Action, including the training requirements for the Air Force.
PN-3	1034, 1058, 1101, 2006, 2034, 2046, 2047, 2083, 2098, 2106, 2113, 2116, 2121, 3024, 3077	Concern that this expansion is not necessary for national security. Suggestion that training be concentrated on ground training rather than aircraft. The Air Force needs to consider how to use America's resources wisely and the potential harm outweighs the benefits. What airspace will be given up?	FEIS Section 1.0 describes the need for a trained military force. Section 2.10 describes the B-1 and B-52 missions for which aircrews need to be trained. Section 2.11 details the training requirements and limitations of existing training airspace. Section 2.11 explains how the training location alternatives were identified. All airspace is reviewed on an annual basis by the FAA and the Air Force to determine its ongoing need and capabilities to meet the training airspace needs. This review process is separate from NEPA.
PN-4	2104, 2114, 3002, 3021, 3039, 3071	Why is it necessary to fly down to 500 feet (including Native American reservations)? Can they fly at 1,000 feet minimum?	FEIS Section 2.10 describes the low-altitude training associated with the B-1 aircraft. B-1 crews must maintain proficiency in low level employment down to 500 feet AGL to fulfill current and future combat requirements. According to FEIS Section 2.8,

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			approximately 15-20 minutes of a two hour mission would take place below 2,000 feet AGL. The vast majority of this training is currently accomplished at 1,000 feet ATL with a minimum amount of time spent at 500 feet AGL to maintain aircrew proficiency in the unique dynamics of flight at 500 feet AGL. The Standing Rock, Cheyenne River, and Northern Cheyenne Reservations would not be overflown below 12,000 feet MSL under Modified Alternatives A or C.
PN-5	1056, 1066, 2072, 2075, 2102, 3012, 3028, 3052, 3059, 3071, 3080	How many days do you need to train in the airspace? Information in the Draft EIS seems contradictory as to whether LFEs would be 10 days or 12 days per year. Thought the airspace would be used for 10 days but Draft EIS says over 200 days.	FEIS Section 2.5 describes the training requirements and presents the proposed scheduled time for the airspaces to be activated for training. Day to day training would be for 240 days per year. LFE training would be up to 10 days per year (of the 240 days).
PN-6	1058, 2106, 2114	The Bombers have been around a long time. Won't they be replaced soon?	DEIS Section 1.2 explains that the B-1 aircraft continue to be upgraded with multiple advanced technologies to ensure their usefulness and applicability into the future.
PN-7	1064, 3025, 3062	Suggestion that with today's technology, flight simulators can provide additional training. Existing airspace would be adequate with use of flight simulators. Flight simulators need further discussion.	As explained in FEIS Section 2.11.3.3, sophisticated flight simulators will continue to be used to the extent possible. Even the best simulators lack realism of actual flying and aircrews do not receive the same physical training challenge in simulators as during aircraft flight. Extensive aircrew use of simulators is already included in the flight requirements for the proposed PRTC.
PR = Physical Resources			
PR-1	2124, 2132, 3012	Would like to see more water and soil data. Water and soil information is inaccurate. pH in MT area is high to very high in Alkaline.	DEIS Section 3.5 mapped soil types and described pH. Almost all (99 percent) of the regional soils have a pH greater than 5.0 (extremely acidic) or less than 8.5 (strongly alkaline). There is no proposed surface construction (See FEIS Section 2.8.6). FEIS Section 4.5 explains that the only feasible soils or water consequences could be from minute particles of chaff. Chaff concentrations are calculated to be approximately 0.00377 ounces per acre per year. (See FEIS Section 2.4.6.3.) The soil pH

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			is nearly entirely outside the range to react with chaff coatings, and the chaff particles rapidly become indistinguishable from silica and aluminum soil elements. No soils or water impacts would be anticipated. (See also FEIS Appendices C and D.)
SA = Safety			
SA-1	1006, 1044, 1054, 1102, 2001, 2018, 2028, 2042, 2059, 2063, 2066, 2072, 2080, 2084, 2085, 2095, 2107, 2121, 3005, 3054, 3056, 3075, 3079	Concern for mid-air collisions when flying at low levels. What are the safety statistics in the area? What safety measures will prevent mishaps?	FEIS Section 4.3 describes the flight safety of the B-1 and B-52 aircraft, including the Class A accident statistics. These include all aircraft operations, including training below 2,000 feet AGL. The Air Force and FAA would continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may include practices for use of existing data, equipment, and procedures as well as integration of advancements in software and/or equipment.
SA-2	2007	Safety concerns in flying between Billings and Rapid City.	DEIS Section 3.1 explained that Victor airway V86 can be used between Billings and Rapid City, which would be outside the proposed MOA airspace and beneath existing and proposed ATCAAs. IFR or VFR aircraft could use this airway. VFR aircraft could fly see-and-avoid through an active MOA direct between Billings and Rapid City.
SA-3	1058, 1060, 1073, 1096, 2007, 2076, 2095, 2103, 3050, 3054, 3073, 3075	Safety concerns when rerouting during inclement weather or multiple flights on Victor airways without adequate communication.	DEIS Section 3.1 described Victor airway use during inclement weather flying IFR if MOA airspaces are activated. The stacked and additional MOAs are designed to provide for IFR access and training aircraft temporary relocation out of a specific airspace to allow for IFR transit. FEIS Section 2.3.1 explains that the announcement by NOTAM in advance of MOA activation provides as current information as possible. Pilots who could not fly VFR due to weather or contract requirements, sought to obtain real-time information on a MOA activation, and were not able to obtain such information see the lack of information as an adverse impact.

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
SA-4	2007, 3056	Would like better communication with Denver Center, MNP, and SLC to increase safety. Will ARTCC communication boundaries be simplified?	The communication capabilities within the PRTC region are consistent with established requirements for the National Airspace System. Frequency coverage for aircraft operators will continue as currently established. The existing airspace management procedures used by Denver and Salt Lake Air Route Traffic Control Centers (ARTCC) for controlling PR A/B MOA will be revised and expanded to include Minneapolis ARTCC. Any additional coordination requirements necessary for the management of the PRTC will be added to agreements between the air traffic control facilities and the Air Force. The existing procedures within the Aeronautical Information Manual (AIM) covering contact with air traffic control facilities and details published on charts and other Flight Information Publications (FLIP) should be followed to contact the air traffic control agency responsible for any particular MOA.
SA-5	1043, 1050, 1054, 1058, 1063, 1068, 1082, 1084, 1086, 1100, 1101, 1102, 1106, 1108, 1109, 2009, 2029, 2035, 2049, 2071, 2074, 2092, 2099, 2107, 2116 2121, 2124, 2125, 2140, 3002, 3008, 3014, 3025, 3035, 3039, 3041, 3048, 3052, 3055, 3056, 3060, 3062, 3064, 3071, 3074, 3079	Concern about fires caused by flares and the need to restrict use of flares. Not enough analysis has been done. Extreme fire danger rating is too high; should be lower rating. Need to consider suppression capabilities in regional areas. Please provide an historical comparison. Would like flares dispersed no lower than 10,000 feet.	FEIS Section 2.3.1 describes altitude limitations of flare use and the cessation of use under certain fire danger ratings. FEIS Sections 3.3 and 4.3.3.1.3 describe the different types of flare failures and the potential impacts from flares deployed in fire danger conditions, including the National Fire Danger Rating System and the conditions under which Ellsworth AFB would suspend flare use. Ellsworth AFB mutual aid agreements are also described in that FEIS section. Regional response, including federal agencies, would occur for any fire, including an unlikely flare-caused fire. (See also FEIS Appendix D.)
SA-6	1050, 1082, 1084, 1100, 2009, 2100, 3079	A more thorough discussion on how fires from flares will be handled needs to be addressed.	The FEIS extensively and adequately discusses the potential for fires from any source and how such fires would be handled. FEIS Section 2.3.1 describes altitude limitations of flare use. FEIS Sections 3.3.3.3 and 4.3.3.1.3 describe the different types of

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			flare failures and the potential impacts from flares deployed in fire danger conditions. Section 3.3 explains that fire danger ratings are relative, not absolute, and are location-specific, and that land management agencies estimate fire danger for a given rating area. FEIS Section 4.3.3.1.3 also describes Ellsworth AFB mutual aid agreements with local and regional emergency response agencies, which are activated for any fire, including an unlikely flare-caused fire (See also FEIS Appendix D.)
SA-7	1005, 1037, 1039, 1058, 1060, 1065, 1066, 1070, 1073, 1080, 1083, 1091, 1096, 1100, 1107, 1111, 1116, 1118, 2010, 2018, 2019, 2020, 2021, 2022, 2025, 2035, 2061, 2063, 2068, 2071, 2072, 2073, 2075, 2081, 2085, 2091, 2094, 2096, 2103, 2104, 2106, 2107, 2109, 2113, 2117, 2119, 3003, 3004, 3005, 3010, 3012, 3022, 3023, 3025, 3028, 3039, 3041, 3051, 3052, 3054, 3058, 3061, 3064	Concern for private pilot's safety when they are flying in slow planes with much faster aircraft in the area, including impact from wind vortices. Similar concerns for high-performance GA flying into 3 NM circle airports and/or flying in thunderstorm conditions.	Training B-1 aircraft would use see-and-avoid as well as electronic capabilities to identify general aviation aircraft approaching the B-1's path of flight. FEIS Section 4.1 explains that see-and-avoid procedures are the responsibility of all pilots, including military pilots. Section 4.9 explains that uncertainty regarding low-level overflight and wake vortices could have the potential to affect low-flying aircraft, including highline patrol, pipeline patrol, and crop dusting aircraft. Section 4.3 describes the potential safety risks associated with military training aircraft and impacts from lack of communication. This safety risk is seen as an adverse impact. Section 4.3 describes training aircraft accident rates and safety concerns where worsening weather would require a VFR flight to go IFR but a scheduled MOA would prevent IFR flight. The stacked and additional MOAs are designed to provide for IFR access and training aircraft temporary relocation out of a specific airspace to allow for IFR transit. GA uncertainty about flying into scheduled training airspace is further addressed in AM-1. The random and unpredictable B-1 overflight which could occur at any given location an average of six to nine times per year or more at or below 2,000 feet AGL was seen by pilots at hearings as an adverse impact. (See Section 4.9). The Air Force and FAA would continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may include practices for use of existing data, equipment, and procedures as

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
			well as integration of advancements in software and/or equipment.
SA-8	2010, 3004, 3042	Concern for pilot's safety while doing frequent wildlife surveys.	DEIS Section 3.1 described the wildlife and wetlands surveys and photography and identifies specific weather conditions and time periods when such surveys would need to occur. Section 4.9 explains the need to coordinate with Ellsworth AFB to deconflict military operations.
SA-9	1002, 1007, 1039, 1045, 1055, 1100, 1108, 2013, 2073, 2079, 2095, 2115, 3003, 3011, 3065	Concern for safety during recreation and ranching.	FEIS Section 4.8.3 explains land use and recreation impacts and describes startle effects upon domestic and ranch animals. Recreation, including parasailing could occur at specific locations. Often these locations are identified on FAA aeronautical charts. Section 4.8 explains that the Air Force would not normally schedule the airspace from Friday noon through Sunday night to support heavy use recreational activities. Recreation can also include camps for youths and adults. The Air Force will work with ranchers and others to identify seasonal avoidance areas. (See Section 2.3.) Section 5.0 discusses recreational cumulative effects.
SA-10	1108, 2016, 2051, 2107, 3012	Aircraft and bird strike safety concern.	FEIS Section 4.3 explains bird-aircraft strike risk and actions taken to reduce risks.
SA-11	1058, 1066, 2020, 3061	Concern for safety if training includes flying lights out.	Training would not be with lights out in the proposed PRTC MOA airspace.
SA-12	1100, 2025, 2026	Concern for the danger of flares on wells and gas pipelines.	FEIS Section 2.8.5, Section 4.3.3.1.3, and Appendix D explain flare release altitude limitations of 2,000 feet AGL. Flares burn out in 500 feet or at 1,500 feet AGL. It would be extremely unlikely that a burning flare would strike the ground at all (see Section 4.3.3.1.3) and even more unlikely that a still-burning flare could fall at any specific location, such as a well.
SA-13	1100, 2026, 3060, 3074	Can chaff and flare use be limited to winter months to avoid peak fire season?	PRTC training requirements are necessary during summer months, but the Air Force would discontinue flare use when the fire rating is very high or extreme. FEIS Section 2.8 describes chaff and flare use, including flare release restrictions. Chaff

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			does not burn and does not pose any fire risk.
SA-14	1039, 1043, 1045, 1050, 1052, 1054, 1063, 1079, 1104, 1106, 1108, 2035, 2036, 2056, 2057, 2063, 2082, 2099, 2101, 2103, 2116, 3048	Concern of the health risks of ingesting the chaff and flare debris or from dud flares.	FEIS Section 2.8 and Section 4.3.3 describes the chaff and flare residual materials. Proposed chaff deployment would result in an estimated average of 0.00377 ounces of what is effectively soil per acre per year. Chaff and flare plastic or paper pieces have never been recorded as ingested by animals (see FEIS Appendices C and D). Appendix C explains that airborne chaff does not abrade to respirable particles. During controlled tests, animals rejected eating concentrations of chaff. Chaff fibers are dispersed in the air and upon contact with the ground, break down to become silica and aluminum particles indistinguishable from the composition of soil. The animal fat micro-coating of chaff fibers breaks down when exposed to sunlight. (See Section 4.5.) Section 2.8 describes the extremely low risk of any dud flares (one per three years in the entire airspace).
SA-15	1043, 2041, 3026, 3043, 3075	Concern for safety during cloud-seeding operations or agricultural applications.	FEIS Section 4.1 explains that military training pilots would be briefed where weather modification activity is planned. Information on this weather modification activity would need to be coordinated with the Air Force and the industry. Air Force would use see-and-avoid procedures to work with weather modification activities. (See also responses to SO-2 and SO-28.)
SA-16	2041, 2072, 2077, 3006, 3044, 3048, 3052	Concern with use of countermeasures interfering with radar. How will the 60 NM chaff deployment restriction be applied?	Aircrew pre-flight briefings (see FEIS Section 2.10.4.4) identify avoidance areas and distances for deployment of defensive countermeasures. FEIS Sections 2.3 and 2.8.5.1 describe the chaff deployment restriction relative to FAA radars. Weather radars have the ability or identify and distinguish chaff. FEIS Section 4.3.3.1.2 discusses the deployment of chaff after receiving clearance from FAA Frequency Management Authority.
SA-17	1007, 1009, 1082, 2042	Concern pilots are showing off and flying recklessly.	FEIS Section 2.10 describes the detailed activities required for pilot training and briefings in advance of missions. Pilots are training as they are expected to perform in combat and are not flying recklessly or showing off.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
SA-18	2059, 3026, 3043	Most medical flights are above 10,000 feet and may be operating at FL180 to FL250.	FEIS Section 2.3 explains that medical flights would be given priority. Section 4.1 recognizes that medical flights typically are above 10,000 feet MSL. The MOA stratification is designed to permit IFR transit, including emergency flights.
SA-19	1008, 1011, 1043, 1063, 1094, 1096, 1106, 2073, 2074, 3008, 3020, 3026, 3049, 3056, 3068, 3070, 3074, 3075	Concern there isn't adequate communication capabilities when medical or other emergency flights are needed. How will they be given priority?	FEIS Section 2.3 explains that medical flights would continue to be given priority, as they are expedited currently in the existing Powder River MOAs. FEIS Section 4.1.3.1.4 notes that the Air Force currently immediately shift aircraft or end training in the airspace to accommodate emergencies. Also Section 2.3 identifies that MOA segments are designed to permit IFR transit, including for emergency flights. The stacked and additional MOAs are designed to provide for IFR access and would allow training aircraft temporary relocation out of a specific airspace to allow for IFR transit. FEIS Section 4.1.3.1.4 describes the lack of radio coverage and communication within the airspace. Section 2.5 describes the scheduling of the airspace.
SA-20	1072, 1109, 2077, 2140	What are the response measures if an aircraft crashes?	DEIS Section 3.3 described the response measures if an aircraft crashes.
SA-21	1008, 1011, 1094, 1106, 2072, 2077	Concern pipelines won't be checked frequently enough for leaks due to inability to access the airspace.	FEIS Section 2.5 presents the proposed schedule for training airspace activation. Pipeline checks could always be performed below 500 feet AGL or when training airspace was not scheduled. As with any temporary avoidance area, when informed of an activity, the Air Force would work with the entity to avoid the area and/or altitude.
SA-22	1082, 1105, 2080	Concern for increased heart and other health problems for those who live under a flight path.	There is no particular flight path for aircraft training within the airspace. DEIS Section 3.2 described the random nature of flight training activity throughout the airspace. FEIS Section 4.9 describes the calculated six to nine annual average number of overflights for any given location within the airspace, although specific locations could be overflown more or less frequently. Individuals overflown may be annoyed, but there would be no flight paths with individuals regularly overflown.
SA-23	2074	Concern for the sonic boom's effect on	FEIS Section 4.2 describes the overpressure from sonic booms.

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
		pipelines.	All pipelines are constructed to withstand substantially greater pressures than could possibly be generated by a sonic boom.
SA-24	2084, 3049	Concern of increased risk and inability to avoid towers when training or overflight damage to wind machines.	DEIS Section 3.3 explained that towers are mapped and lighted. Training aircraft identify and avoid all towers during flight operations. Permanent avoidance areas are established for towers. No damage to tall structures or wind machine operations would occur (see Section 3.3.3.3).
SA-25	2096	Concern the additional time pilots will be in the air trying to get around an active MOA will increase safety risks.	Pilots can transit an active MOA using see-and-avoid or receive IFR priority to arrive or depart an airport under an active MOA. FEIS Section 4.3 explains that general aviation unable or unwilling to transit an active MOA using see-and-avoid, unable to communicate for IFR flights, and unwilling to exercise ground hold or reschedule during the time the MOA would not be active could potentially expend up to 4 hours of additional travel time either in ground delay and/or re-routing around an active MOA. If a pilot chose to re-route and fly the additional time, there would be no quantifiable safety effect associated with a non-quantifiable estimate of whether or not a pilot would elect to re-route, ground hold, fly IFR, or fly see-and-avoid. FEIS Section 4.1 also explains that communication capabilities would be available prior to training in a low MOA. VFR pilots unwilling to fly see-and-avoid, ground hold, or reschedule could see any additional flight time as an adverse impact.
SA-26	1046, 2109, 2121, 2084, 3052, 3064	Concern chaff and flare use will create airborne FOD hazards.	There has not been a recorded instance of chaff or flare plastic or paper residual materials damaging an aircraft, even in extensive use training ranges such as Nevada Test and Training Range or Utah Test and Training Range. Chaff fibers, thinner than a human hair, rapidly disperse in the air. Plastic and paper pieces (described in FEIS Appendices C and D) fall to the ground as described in FEIS Section 2.8.
SA-27	1003, 1050, 1058, 1086, 1098, 1104, 1108, 1113, 1117, 2020, 2036, 2084,	Concern for the impacts from Chaff and Flare use on the environment, air quality, and people below. Concern that additional study needs to	FEIS Section 2.8 describes the lifecycle of chaff and flares. Section 4.8 describes the chaff and flare impacts, including residual materials which fall to the ground. FEIS Section 4.6

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
	2092, 2101, 3056	be done to determine the effects of chaff on animals and humans. Will the Air Force provide chaff and flare education to fire investigators?	describes the extent of distribution of such residual materials. FEIS Appendix C explains that long-term studies to identify chaff have demonstrated that chaff breaks down quickly to particles of aluminum and silica, which are the most common elements in the soil. The degraded chaff particles are effectively indistinguishable from existing soil particles. FEIS Appendix D provides expanded details on flare type, usage, and impacts. As described in Section 2.8 and Section 4.3 of the FEIS, the Air Force will work with local fire departments under the proposed airspace to educate them on chaff and flare deployments and residual materials.
SA-28	1098, 2101	The analysis assumes chaff will be distributed evenly throughout the airspace, is this fact or will it be concentrated within routine training routes? Can the amount of chaff deployed be quantified?	FEIS EIS Section 2.8.5 describes the quantity of chaff deployed and chaff distribution. Chaff is not limited to any specific area. It is used in response to air- and/or ground-based threats. Winds at deployment altitude would disperse chaff fibers which are thinner and lighter than human hair. Aircraft training flights and chaff distribution would be random and not localized.
SO = Socioeconomics			
SO-1	1001, 1009, 1037, 1043, 1045, 1051, 1056, 1082, 1084, 1063, 1069, 1073, 1076, 1086, 1096, 1097, 1098, 1100, 1103, 1104, 1111, 1115, 1119, 2004, 2006, 2011, 2013, 2015, 2021, 2029, 2031, 2036, 2045, 2050, 2054, 2071, 2078, 2080, 2082, 2091, 2092, 2101, 2102, 2106, 2108, 2113, 2121, 3012, 3014, 3043, 3048, 3080	This will decrease home/ranch values. If the military is going to take our land, we should be compensated for it.	As described in FEIS Section 4.9, the presence or absence of training airspace over existing ranches and farms is not considered in land appraisal value within the ROI. (See also SO-19.)
SO-2	1005, 1008, 1011, 1068, 1073, 1083, 1094, 1096,	Spraying crops will be limited or impacted by low-altitude training overflights or wake	FEIS Sections 4.3.3 and 4.9 explains the safety elements associated with wake vortices and crop-spraying aircraft. Section

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
	1114, 2004, 2015, 2031, 2045, 2059, 2107, 3002, 3004, 3039, 3070	vortices which will have an economic impact on our crops. Would like mitigations during crop spraying months.	4.9 describes the average overflight of any given area. Potential safety risk to agricultural application aircraft is an unavoidable adverse impact. Economic concerns related to agricultural uses are addressed in FEIS Section 4.9.3.1.2; impacts to crop-dusting etc., are discussed in Section 4.8, Land Use.
SO-3	1073, 1082, 2004	Concern the tax base will go down when property tax goes down impacting the regional area.	As described in FEIS Section 4.9, the presence or absence of training airspace over existing ranches and farms is not considered in land appraisal value within the ROI.
SO-4	2006	The quiet and serene environment is part of the value of the land.	FEIS Section 4.2 explains noise consequences. FEIS Section 4.9 describes the estimated average number of times per year a location could experience low-level overflight. Section 4.1 explains that individuals under the existing Powder River A and B MOAs (proposed PR-2) have been startled by low-altitude training aircraft. During hearings, individuals expressed the concern that even infrequent low-altitude overflights, and the uncertainty of such overflights, would have an adverse impact; that impact would be unavoidable.
SO-5	1063, 1096, 1108, 1119, 2010, 2043, 2059, 2063, 2071, 2073, 2095, 3004, 3012, 3020, 3026, 3036, 3043, 3052, 3054, 3058, 3061, 3063, 3068	Concern for the economic impact to the areas that become off limits to pilots, including medical teams.	No areas under the proposed MOAs would become off-limits to civilian pilots. FEIS Section 4.9 explains that emergency flights will be given priority. Different MOA segments facilitate IFR flights through activating or deactivating different MOAs (See Section 4.1.) Section 2.5.1 explains the schedule for flight training. If a MOA or ATCAA were scheduled, civilian aircraft seeking to fly IFR in the airspace or change from VFR to IFR due to weather would contact ATC and the Air Force training aircraft would temporarily use a different MOA. To support IFR flights. Economic concerns about flying VFR through active MOAs are addressed in Section 4.9.3.1.2.
SO-6	1009, 1051, 1096, 2010, 2020, 2044, 2071, 2073, 2094, 2096, 2101, 2117, 3001, 3004, 3008, 3054, 3063, 3074, 3081	Concern for the economic impact to businesses, such as during LFEs, due to people not able to or want to fly to the area.	The Air Force and FAA would continue coordination to develop procedures to handle nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			airspace to the NAS. The Air Force does not propose to schedule PRTC during weekends or holidays, which are high GA use. Increased civil aircraft flights at times, such as the beginning of hunting season, would function as described for IFR and VFR flights (see Section 4.1.3.1 for review of IFR and VFR civil flights). Section 2.5 describes the LFE activity and hours when LFE operations would occur. As described in Section 4.1, civil aviation could schedule around the quarterly LFEs conducted 1 to 3 days a quarter, for not more than 10 days per year. During an LFE there could be a period of 2 to 4 hours per day of training. This would not be expected to have a significant impact upon businesses in the area. Hunting and other forms of recreation coexist with military training under the existing Powder River MOAs. Normal flights could occur during LFE days when the airspace was not active. AM-1 addresses the overall need for communication and coordination. For noise effects on hunting see Section 4.9.2. Effects to reservations are discussed in the Cultural (Section 4.7) and Environmental Justice (Section 4.10) sections.
SO-7	1005, 1037, 1046, 1047, 1051, 1056, 1060, 1101, 1107, 1114, 1116, 2004, 2007, 2062, 2071, 2072, 2073, 2094, 2095, 2096, 2108, 2109, 2122, 3005, 3010, 3025, 3026, 3028, 3033, 3037, 3043, 3048, 3050, 3051, 3052, 3054, 3059, 3061, 3063, 3064, 3065, 3073, 3078, 3081	This will increase fuel consumption, increasing costs to private pilots and commercial airlines when they have to fly around the active MOAs. GPS and NexGen radar make Victor airways obsolete.	Civil aircraft flights above FL260 would not be affected by the proposed PRTC. FEIS Section 4.1 explains that there could be increased fuel consumption for civil aviation if a pilot did not schedule around the times of the NOTAM-announced activated airspace, chose not to fly see-and-avoid, could not fly in an inactive MOA segment, or decided to fly IFR around an active MOA. If a pilot chose not to do any of the above actions, an up-to-4-hour delay or re-routing could be seen by civil aviation pilots as an adverse impact (see also response to SO-6 and SO-9). When training airspace was not activated, a pilot's use of GPS for direct VFR flights would not be affected.
SO-8	1006, 1037, 1096, 2004, 3005, 3014, 3020, 3022,	This will cause long delays which will increase costs to civil aviation.	FEIS Section 4.9 explains the extent of delay which could be anticipated if GA elected to not fly see-and-avoid during the

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
	3026, 3036, 3050, 3052, 3054, 3064, 3068		time period when a MOA was scheduled, were unable to fly IFR, or were unwilling to fly IFR under ATC direction, Table 3.1-7 presents the estimated daily civil operations within the airspace during proposed scheduled training hours. Delays of 2 to 4 hours for those who elected not to fly VFR see-and-avoid and could not fly IFR could be seen as an adverse impact.
SO-9	1009, 1037, 1045, 1056, 1065, 1108, 2014, 2015, 2071, 2082, 2105, 2107, 2108, 2113, 3023, 3026, 3043, 3064, 3065, 3070, 3080	Concern tourism, including hunting and recreation, will decrease when MOAs are in use.	FEIS Section 4.8 explains that hunting and recreation regularly occur under the existing Powder River A and B MOAs (proposed PR-2). MOA activation is not expected to impact tourism, hunting, or recreation, as described in Section 4.8. The mitigations described in FEIS Section 2.3.1 explain avoidance elements of the Little Bighorn Battlefield National Monument. The frequency of low level overflight (2,000 feet AGL or below) is estimated to average 6 to 9 times per year at any given location. In the unlikely event that a hunter or game was startled, the EIS notes that the hunter would likely be annoyed. (See FEIS Section 4.8.) FEIS Section 4.9 describes the potential GA flight delays which could occur as a result of GA pilot decisions when a MOA was scheduled. Air Force training operations would be temporarily adjusted to allow IFR arrival and departures to/from airports beneath PRTC (see FEIS Section 4.1).
SO-10	1006, 1058, 1060, 1063, 1068, 1081, 1095, 2014, 2040, 2059, 2072, 2073, 2074, 2090, 2099, 2117, 3001, 3003, 3005, 3012, 3020, 3023, 3036, 3045, 3052, 3054, 3057, 3061, 3064, 3079, 3080	Concern for the economic impact on regional airports, including future development of airports/airstrips.	FEIS Section 2.3.1 describes military training exclusion areas for public airports under the proposed airspace, which generally are a three-nautical mile circle with an altitude of 1500 feet. FEIS Section 4.3 explains that public airports and private airfields dependent on transient air traffic could be impacted. As a consequence, if an individual chooses not to, or is unable to, fly when the MOA is active, local airport users could experience delays of up to 4 hours. Pilots unable to fly IFR and unable or unwilling to fly VFR in an active MOA could experience an up-to-4-hour delay (see FEIS Section 4.1.3.1.3). The Air Force and FAA would continue coordination to develop procedures to handle those nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected airspace to the NAS.
SO-11	1005, 1008, 1011, 1058, 1086, 1094, 2017, 2021, 2078, 3054	Concern for the economic impact this will create on ranchers checking on their animals by plane.	FEIS Section 4.9 describes the average extent of overflight, and Section 2.10 describes the average time when military aircraft would be at altitudes 2,000 feet or below. FEIS Section 2.3 explains that the Air Force would provide for reasonable temporary avoidance when provided information of a ranching activity such as weaning and branding. Ranchers could access NOTAMs to determine when an airspace was active. Individuals who chose not to fly see-and-avoid during the period of a low-level scheduled MOA and could not delay or reschedule their flights to check on animals during the time when the MOA would not be scheduled, see the additional limitation as an adverse impact; that impact is unavoidable.
SO-12	1001, 1083, 1094, 1101, 1104, 2015, 2031, 2048, 2049, 2116, 3002, 3064, 3070	Who do we contact for damage claims? Will claims be handled locally? Ellsworth AFB does not respond to calls.	FEIS Section 4.3 explains that, for example, penned range cattle could be spooked by sudden noise or low-level overflight. FEIS Section 2.12 explains that the Air Force will work with ranchers to establish reasonable avoidance areas. The section also includes the damage claims process which begins by contacting Ellsworth AFB Public Affairs. (See also GE-8.)
SO-13	1001, 1013, 1014, 1015, 1016, 1017, 1018, 1019, 1020, 1021, 1022, 1023, 1024, 1025, 1026, 1027, 1028, 1029, 1030, 1031, 1032, 1033, 1035, 1043, 1055, 1063, 1084, 1096, 1097, 1098, 1099, 1103, 1106, 1109, 1111, 1117, 2015, 2031, 2048, 2071, 2078, 2085, 2086, 2091, 3002, 3035, 3041, 3043,	Concern for the economic impact of animals getting spooked and hurting themselves or others, taking out a fence, reduced fertility, etc. How will we be compensated? Would like mitigation measures in place to avoid round up, birthing areas, finishing enterprises, etc.	FEIS Section 4.3 describes the potential impact to animals and explains that the Air Force will work with ranchers under a variety of circumstances, particularly when provided timely notification, to identify sensitive times and locations to avoid scheduling low-altitude overflight during those times. (See also BI-2.) FEIS Section 4.9 describes the average number of low-level overflight at any given location under the airspace. Low-level overflight is seen as an unavoidable adverse impact without mitigations. FEIS Section 2.12 describes how damage claims would be handled. Mitigations described in FEIS Section 2.3.1 include: "Temporary avoidance areas would be coordinated with ranches to reduce the potential for impact during concentration of range animals for branding, calving,

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
	3064		weaning, and/or other ranch operation."
SO-14	1004, 1058, 1063, 1101, 2020, 2086, 2101, 2116, 3073	This project is too costly. Who pays for it? How is it a fuel savings for the Air Force if transient aircraft train in the airspace from other bases?	As explained in FEIS Section 2.10, the PRTC airspace provides for substantially improved training with available fuel resources.
SO-15	1005, 1008, 1011, 1094, 1100, 1119, 2025, 2026, 2030, 2061, 2081, 2116, 3039, 3043, 3070	Concern for the economic impact from the inability to perform predator control.	FEIS Section 4.9 describes the average extent of overflight, and Section 2.5 describes the average time when military aircraft would be at altitudes 2,000 feet or below. FEIS Section 2.3 explains that the Air Force coordinate with ranches to identify temporary avoidance areas to reduce the potential for impact during concentration of range animals for branding, calving, weaning, and/or other ranch operation. Ranchers could access NOTAMs to determine when an airspace was active. Individuals who chose not to fly see-and-avoid during the period of a low-level scheduled MOA and could not delay or reschedule their flights during a time when the MOA would not be scheduled, may see the additional limitation as an adverse impact.
SO-16	1008, 1038, 1043, 1063, 1096, 1100, 1113, 2027, 2071, 2078, 2081, 2091	Concern for the economic impact on wool value from chaff or chaff and flare materials.	FEIS Section 2.8 and Appendix C explain that chaff fibers rapidly break down and become the equivalent of soil. Wool processing procedures include methods for cleaning the wool for soil, burrs, or other materials. Chaff particles are indistinguishable from soil, so, in the unlikely event that a chaff particle alighted on a sheep, such particles would be removed along with other materials in the wool cleaning. There is no basis for believing that chaff or flare inert plastic or paper pieces would become attached to sheep or to any other animal. (See FEIS Appendices C and D for relative sizes of the plastic pieces.) The normal procedures for cleaning the wool would clean out any extremely unlikely pieces of chaff or flare residual materials.
SO-17	1005, 1082, 1096, 2035, 2038, 2045, 2059, 2064, 2072, 2074, 2079, 2101, 2116, 3004, 3007, 3008, 3010, 3014, 3029, 3030,	Concern for the impact of future wind farms, oil and gas development, or communications towers.	FEIS Section 4.9 explains that the Air Force would not oppose the development of wind farms which would not impact military readiness or training. Future wind farms approved by FAA would be mapped for flight avoidance. FEIS Section 4.8 explains that the proposed action would not inhibit wind farm development

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
	3033, 3044, 3048, 3049, 3054, 3070		under the airspace. Sections 4.9 and 5.0 explain that no impacts to oil and gas development or other surface development would occur from aircraft overflights. Section 2.3 explains that an adopted mitigation would be the avoidance of known blasting operations (see Sections 4.9 and 5.0). Communications towers are designed to withstand wind forces substantially in excess of aircraft wake vortices. Towers are mapped and avoided. (See Section 3.3.) The proposed action does not include any Air Force construction projects under the airspace.
SO-18	2044, 2057, 2080, 2100	Concern that low-level or supersonic flights will damage houses or household items or disrupt lives and sleep.	FEIS Section 4.8 explains that vibration from infrequent sonic booms or an average of 6 to 9 low-level flights per year could vibrate bric-a-brac. Section 2.12 describes the Air Force procedure for damage claims. Sudden overflight or sonic booms during LFEs 1 to 3 days once a quarter for up to 10 days per year could be seen as an adverse impact.
SO-19	2045	More analysis needs to be done on impacts on property values. The document only uses appraisers in Montana.	FEIS Section 4.9 explains that MT, ND, SD, and WY state laws were reviewed to determine the appraisal process for property valuation, and appraisers were interviewed in MT. There are no property appraisal procedures or laws that would affect appraisal processes in any location under the proposed MOA (see Section 4.9.3.1.1). MT was used in the example because much of the existing Powder River A and B MOAs overlie MT.
SO-20	2045	Feedlots/CAFOs have not been adequately identified or considered in economic impacts.	FEIS Section 2.3.1 explains that the Air Force will work with ranchers and farmers to identify noise-sensitive locations and establish reasonable avoidance areas around those locations when they are in use.
SO-21	2045	EIS should explain how landowners and residents have been affected by past training.	FEIS Section 4.8 explains that B-1 training has occurred in Powder River A and B MOAs (proposed PR-2) for decades. Section 4.9 explains that ranch and farm activities as well as recreational activities, including hunting, all occur under the existing MOAs. Impacts have been avoided when seasonal avoidance areas were identified, for example, by ranchers. There is no quantifiable difference among the economic

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			activities under the existing airspace or the proposed airspace, except that the percentages of ranching and agricultural land uses are somewhat different, and there are no designated urban or tribal areas under the existing airspace. Altitudes and avoidance areas proposed in the Modified Alternatives are designed to reduce effects on these areas. FEIS Section 5.0 describes past, present, and foreseeable actions and discusses cumulative effects.
SO-22	1060, 1105, 1108, 2045, 2059, 3008, 3012, 3023, 3024, 3025, 3033, 3036, 3037, 3051, 3061, 3064, 3078	The EIS does not adequately or accurately discuss regional or national economic impacts.	FEIS Section 4.8 explains that B-1 training has occurred in Powder River A and B MOAs (proposed PR-2) for decades. Section 4.9 explains that ranch and farm activities as well as recreational activities all occur under the MOAs. Public airports and private airfields, as well as energy development, are located under the existing training airspace. There is no substantial difference between the ranching and agricultural land uses under the existing airspace and under the proposed airspace, with the exception that the percentages of ranching and agricultural land uses differ somewhat. (See Section 3.8). The differences between the existing airspace and the proposed airspace are that there are no designated urban or tribal areas under the existing airspace. FEIS Section 4.1.3.1.3 explains that since the vast majority of the commercial jet route traffic is above FL260 and could have been significantly impacted by the higher altitude ATCAA flight training activities, proposed ATCAAs above FL260 were removed from the PRTC proposal.
SO-23	2071	Would like property values of homes in metropolitan areas near airports compared to those outside of flight path.	There are no areas under existing or proposed MOAs where noise levels approach those in metropolitan areas near airports. There are no proposed flight paths over any locations. FEIS Section 4.9 explains the random nature of flight activities within the existing and proposed MOAs. FEIS Section 4.2 explains that there are no areas under the proposed airspace where day-night (DNL) noise levels would approach the noise levels where property values are identified as being affected in metropolitan

Table 1.8–1. Comment and Response Matrix

Code	Letter/Transcript Number	Description	Response
			areas.
SO-24	1058, 1106, 1116, 1118, 2071, 2095, 2098, 2102, 2106, 2107, 2113, 2117, 3065	The economic benefits go to South Dakota and North Dakota but not Montana or Wyoming.	Direct economic benefits from a military installation are primarily experienced by the community or communities nearest the installation. In this case, Ellsworth AFB is located in the northwest part of South Dakota. The existing electronic capabilities are located in South Dakota, Wyoming, and Montana. National defense training requirements, not the distribution of economic benefits, drives the physical configuration and location of the proposed action. FEIS Section 1.0 describes the driving forces behind the purpose and need for the Proposed Action.
SO-25	1003, 1106, 2072, 2124	Concerns about base closure.	The potential for base closure is beyond the scope of this action.
SO-26	2073, 3004, 3012, 3043, 3052	Concern that flight instruction schools will be economically impacted.	FEIS Section 4.9 describes how regional airports would be avoided during B-1 flight training by a three-nautical mile by 1,500-feet avoidance area. If the avoidance areas do not permit flight instruction, students would not be expected to fly see-and-avoid in an active MOA. MOA scheduling information and announcement by NOTAM of MOA activation would help with planning for flight instruction. If the mitigations in FEIS Section 2.3.1 were deemed to be inadequate for flight instruction, operators could see the random low altitude flights as an adverse impact.
SO-27	1119, 2100	Concern if the Sage Grouse is listed as endangered, thousands of people will be put out of business.	DEIS Section 3.6 explained that the greater sage grouse is currently a candidate species. FEIS Section 4.6 explains that human surface activity has been shown to disturb sage grouse leks. Infrequent random overflights or rare sonic booms during LFEs would not be the type of noise that has been demonstrated to affect sage grouse leks.
SO-28	2041, 3006, 3043, 3075	Concern for the economic impact to cloud seeding operations as well as flight safety for VFR and IFR air operations for private and commercial purposes; affecting weather	DEIS Section 3.1 recognized that weather modification flights have to respond rapidly to meteorological conditions. FEIS Section 4.1 explains the mitigation measures for potential impacts to other airspace users. These measures would require

Table 1.8–1. Comment and Response Matrix

Code	*Letter/Transcript Number*	*Description*	*Response*
		modification operations (cloud seeding), crop spraying, and fire suppression throughout the region	increased communication between weather modification entities and the Air Force during scheduled MOA periods. Scheduling of airspace, announcement by NOTAM of activation, and effective communication should reduce impacts to cloud seeding operation, crop spraying, and fire suppression. (See FEIS Sections 4.1, 4.8, and 4.9.)
SO-29	1041	Few problems under airspace. One phone call establishes temporary no-fly zone for ranching operations.	DEIS Section 4.8 explained that aircraft have overflown what is effectively the proposed PR-2 for decades. FEIS Section 2.3.1 explains that the Air Force will continue to work with ranchers to establish avoidance areas.
SO-30	2059	Acreage listed in the agricultural table does not seem accurate.	Values in a Section 3.9 table in the DEIS were misaligned by one row. Table has been corrected in the FEIS.

APPENDIX H
FAA CIRCULARIZATION COMMENTS AND AERONAUTICAL STUDY INPUTS

This page intentionally left blank.

APPENDIX H FAA CIRCULARIZATION COMMENTS AND AERONAUTICAL STUDY INPUTS

This appendix contains correspondence submitted from the public to the Federal Aviation Administration (FAA) during the 2014 circularization process. The correspondence to the FAA was a response to an invitation for the public to provide comment on aeronautical impacts in light of the proposed airspace. This material was submitted to the Air Force pursuant to FAA Order 7400.2K, Part 5, Chapter 21, Section 5 and can be found in Letters 1 through 314 of this appendix. It also contains FAA memo, 25 July 2014, Aeronautical Study Consultations, PRTC MOA, 14-AGL-06NR, submitted to the Air Force and labeled as Letter 315 of this appendix. The FAA submitted all public comments from the circularization of the PRTC aeronautical proposal and the agency's summation of consultations on the results of the air traffic aeronautical studies, to the Air Force, as the Air Force's Cooperating Agency on the EIS. The FAA provided this information in keeping with the aeronautical processes of Order 7400.2. None of this information was obtained during or connected to the public comment period required for the Draft EIS. The Air Force has considered the material provided by the FAA in this Appendix and assigned one or more comment response codes using a format similar to the public comment response process reflected in Appendix G. Note that assigned comment response codes for correspondence provided by the public to the FAA are detailed immediately preceding Letter 1, while a separate response matrix is provided for the FAA's summary of aeronautical study consultations immediately before Letter 315. While all submissions were fully considered by the Air Force, only substantive submissions were carried forward for further analysis. The Air Force did not attempt to respond to any comment that discussed the nature of the FAA circularization process or any other issue which falls solely under FAA jurisdiction or oversight. Generally, the Air Force addressed substantive submissions in a collective fashion in order to harmonize interpretation of the inputs, apply codes similar to those used for responding to public comments on the Draft EIS, and otherwise adequately address the submissions in a reasonably efficient manner. By addressing these submissions, the Air Force provides additional information for the public, acts consistent with the spirit of the National Environmental Policy Act (NEPA), and facilitates consideration of the inputs by the decision-maker.

Comment and Response Matrix

Code	Description	Response
AM = Airspace Management		
AM-1	Concern about coordination between the Air Force and the FAA for the recall of military aircraft from the airspace as necessary in a timely manner.	As explained in DEIS and the FEIS Section 1.5, the FAA is a cooperating agency and will make decisions regarding airspace establishment. FEIS Section 2.3.1 describes mitigations associated with the scheduling of the airspace. The Air Force will establish procedures acceptable to the FAA to recall military aircraft from the airspace prior to the Air Force operating in the proposed Low MOAs. Military aircraft would be recalled in a timely manner for a number of reasons such as IFR arrivals and departures to airports within the airspace, as well as to support emergencies.
AM-2	Concern about impacts from increases in military air traffic from Ellsworth AFB to the proposed airspace.	As described in FEIS Section 2.5.2, the increased size availability of a local training airspace would allow an increase in training activity; however, total flight operations would not be expected to exceed those analyzed and published (12,000) in the 2008 Ellsworth AFB Air Installation Compatible Use Zone (AICUZ) Study, which is available on the Ellsworth AFB website (http://www.ellsworth.af.mil/shared/media/document/AFD-090428-076.pdf).
AM-3	Concern for the lack of radio and radar coverage and communication. Can the Air Force work with the FAA to place radio and radar equipment? Concern regarding the uncertainty of low-level flights.	FEIS Section 4.1 acknowledges the limitations of radio communication and radar coverage within the airspace. FEIS Section 2.3.1 describes the scheduling of the airspace. The Air Force acknowledges that limited radio and navigation coverage exists in many of the areas proposed for the PRTC and is committed to not schedule low MOAs until adequate communication to withdraw a training aircraft is established. To partially address this concern, the Air Force will coordinate with FAA to establish procedures to announce to other aircraft when military aircraft enter or exit training airspace below 12,000 feet MSL and to monitor other aircraft transmissions when operating below 12,000 feet MSL during non-LFE training. The Air Force and FAA will continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may include practices for use of existing data, equipment, and procedures as well as integration of advancements in software and/or equipment.

Comment and Response Matrix

Code	*Description*	*Response*
AM-4	Concern that not all of the airports and airfields are identified in the Draft EIS-particularly the Black Hills Airport. Concern that not all of the registered aircraft are accounted for in the Draft EIS data and that not all of the flights are accounted for in the analysis.	FAA sectional aeronautical charts for Cheyenne and Billings, which encompass the proposed airspace, were used to identify public airports and private airfields under the proposed airspace. Airports or airfields which were not recognized on FAA charts are not included in the analysis. DEIS Section 3.1 included public airports, including the Black Hills Airport, and private airfields. Airport operations reported to the FAA are included in the impact analysis.
AM-5	Concern that the airspace will impact airport access and the setback distances are not adequate to support major airports on the edge of the airspace. Suggestions to expand the setback distances or apply setback distances to airports under the airspace.	FEIS Section 2.3.1 explains the mitigations incorporated to adjust MOA boundaries, activation of PR-1A and PR-1C High MOAs and ATCAAs only during LFEs, distance setbacks for other commercial airports, and setbacks on a Victor airway to support access and transit of the airspace. MOA and ATCAA scheduling, setback distances allow for preferred civil aviation climb or descent rates. As described in FEIS Section 2.3.1 and in accordance with FAA Order 7400.2K, the Air Force will avoid private airfields by 1,000 feet AGL and 1NM radius and public airports by 1,500 feet AGL and three NM radius.
AM-6	Concern the airspace is a large area that will be blocked off to civilian aircraft access and will impact general and commercial aviation. Concern the size of the airspace and proposed times of use are excessive for Air Force purposes. Suggestions for additional review and coordination with communities and agencies.	DEIS Sections 1.2 and 1.3 described the reason for the airspace to provide the best training for aircrews, and FEIS Section 4.1 acknowledges that the airspace will impact general aviation and commercial aviation. As described in FEIS Section 2.0, the full extent of the proposed airspace would be active for LFEs. During non-LFE times the Gap MOAs/ATCAAs would not be active. FEIS Section 2.3.1 explains that the ATCAAs would be capped at FL260 and that advance scheduling of airspace and announcement by NOTAM of MOA activation would allow near real-time information to be available.
AM-7	Is the Air Force going to fly lights off at night? This would prevent VFR access.	The proposed airspace does not include lights out night training in the existing or proposed MOAs.
AM-8	Do you fly with transponders or use methods to electronically see other aircraft?	Bomber aircraft have transponders. B-1 aircraft do not have equipment to electronically see other aircraft.
AM-9	Is this going to become restricted airspace?	This proposal does not include the creation of restricted airspace. The Air Force is only considering the creation of Military Operations Areas and Air Traffic Control Assigned Airspace as described in FEIS Sections 2.4 through 2.7.
AM-10	Comment response code not used.	

Comment and Response Matrix

Code	Description	Response
AM-11	Concern that the proposed activities would be more appropriately conducted in a Restricted Area.	There is no proposal for restricted airspace, and B-1s currently train in the Powder River MOAs and associated ATCAAs. DEIS Section 1.3 explained why the local MOA and ATCAA airspaces are needed, and DEIS Section 2.3 presented the detailed alternative screening process for the airspace. DEIS Section 1.2 explained that training locations with restricted airspace would continue to be used for specific military training missions.
AM-12	How will people know when the airspace is hot? How much notice will be given? How will it be scheduled? The Air Force has taken all the flexibility at the expense of civil aviation. The NOTAM system is inadequate. Requests for prior notice of LFEs or training flights in specific areas.	FEIS Section 2.3.1 explains that there would be airspace advance scheduling and 2-hour NOTAM activation allows near real time information. The NOTAM system is the way FAA communicates with civil aviation. Quarterly LFE exercises of one to three days would be scheduled at least 30 days in advance. IFR flights would be accommodated by using the stacked MOAs. Pilots who elected to not fly see-and-avoid through a scheduled airspace or were required to fly weather IFR or other IFR could see an inability to obtain unrestricted access as an adverse impact. The Air Force will continue to coordinate with FAA to support procedures to announce to other aircraft when military aircraft enter or exit training airspace below 12,000 feet MSL and to monitor other aircraft transmissions when operating below 12,000 feet MSL during non-LFE training. The Air Force and FAA would continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may include practices for use of existing data, equipment, and procedures as well as integration of advancements in software and/or equipment.
AM-13	Concern for the inability to fly IFR while the MOA is activated to conduct cloud seeding operations. Would like the Air Force to train in PR-3 in morning block.	FEIS Section 4.9.3.1.2 describes cloud-seeding coordination requirements. The Air Force would coordinate with the North Dakota Atmospheric Resource Board to establish procedures whereby Air Force training requirements and weather modification operations can be mutually compatible.
AM-14	Concern aircraft are flying below 500 feet and people are being 'buzzed'. What kind of enforcement is available?	The B-1 has an altitude setting capability which established terrain following at specific altitudes. The terrain-following capabilities are tested prior to B-1 launch to ensure that the aircraft fly at the set altitudes. As described in DEIS Section 1.4, low-altitude proficiency training for terrain-following flights would occur down to 500 feet AGL. Should an aircraft be reported as flying below the authorized altitude, recent aircraft data can be reviewed to determine deviations and appropriate corrective actions can be taken.

Comment and Response Matrix

Code	*Description*	*Response*
AM-15	Concern people's buildings are being used as targets.	As described in FEIS Section 2.3, the Air Force avoids low-level overflight of ranches and residences as noted in the Powder River Training Complex Briefing Guide, 14 February 2011, which is required reading for every military user of the Powder River MOA prior to each flight.
AM-16	Concern that the proposal makes provisions for Victor airways which are being phased out in favor of point-to-point navigation. Proposal needs to consider point-to-point navigation impacts.	Civil aircraft regularly use GPS for point-to-point navigation. GPS point to point VFR could continue to fly see and avoid. Training in an active MOA would be adjusted to support IFR transit and IFR arrivals and departures to airports under the proposed airspace. The Air Force and FAA would continue coordination to develop procedures to handle those nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected airspace to the NAS.
AM-17	There is no discussion of Remotely Piloted Aircraft.	There are no proposed remotely-piloted aircraft (RPA) associated with PRTC action. No RPA aircraft would be based out of Ellsworth AFB. The RPA personnel based at Ellsworth AFB operate RPA remotely through satellites.
AM-18	Comment response code not used.	
AM-19	The DEIS does not consider other aircraft in the area such as hot air balloons, paragliders, and other small aircraft. It also does not discuss other users who do not reside within or adjacent to the proposed airspace.	DEIS Section 4.1 explained that other light aircraft and paragliding occurs within the area. Frequently, such recreational activity occurs during weekends when B-1s would not normally be training. DEIS Section 4.1.3.1.3 described the airports on the periphery of the proposed PRTC. DEIS and FEIS Section 3.1 contain FAA-documented air traffic use through the airspace during the times the proposed airspace would be active. This includes local flights and transient users who do not reside in, or adjacent to, the proposed airspace. As noted in FEIS Section 4.1, all flight activity, including FAA IFR information, public airports and private airfields, was used to explain potential impacts. Section 4.9 considers other users of the airspace.

Comment and Response Matrix

Code	Description	Response
AM-20	Will corridors be open 24 hours a day to allow VFR and IFR traffic? Suggestions for non-military corridors are created separate by altitude for different classes of aircraft use.	FEIS Section 3.1.3.4.1 describes the Victor airways and explains that Victor airways would be avoided during day-to-day training and be open 24 hours a day to allow IFR traffic. VFR traffic could use the Victor airways or fly see-and-avoid in an active MOA. During LFEs, from one to three days per quarter for up to ten days per year, Gap MOAs and ATCAAs would be activated an estimated four hours per day. IFR traffic could not be routed through an active MOA. The high and low MOAs would permit IFR routing by adjusting training aircraft operations in the airspaces.
AM-21	Concern that IFR traffic would not be permitted through the airspace when active. Concern that commercial and GA traffic would have to avoid the airspace while it is active and have to re-route to destination. The corridors do little to mitigate the impacts to airports and GA.	FEIS Section 2.3 explains that the proposed ATCAA ceiling is lowered from FL600 to FL260 and that there would be airspace advance scheduling and NOTAM activation to allow for near real time information. The NOTAM system is the way FAA communicates with civil aviation. Section 4.1 explains that IFR and VFR traffic can operate on the Victor airways. VFR can fly see-and-avoid through an active MOA. IFR traffic could not fly in an active MOA. The Air Force would work with ATC to adjust operations to accommodate IFR traffic. IFR flights would be accommodated by using the stacked MOAs for training aircraft. Quarterly LFE exercises of one to three days would be scheduled at least 30 days in advance. The Air Force will continue to coordinate with FAA to support procedures to announce to other aircraft when military aircraft enter or exit training airspace below 12,000 feet MSL and to monitor other aircraft transmissions when operating below 12,000 feet MSL during non-LFE training. The Air Force and FAA would continue coordination to develop procedures to handle those nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected airspace to the NAS.
AM-22	Wants to ensure the airspace approved is charted.	FEIS Section 1.6 explains that FAA will make decisions regarding airspace establishment. The FAA will be responsible for charting the approved airspace in accordance with FAA processes (see FEIS Section 2.12) and applicable regulations.
AM-23	Comment response code not used.	

Comment and Response Matrix

Code	*Description*	*Response*
AM-24	Aircraft avoidance area above 2,000 feet above the Little Bighorn Battlefield National Monument is voluntary.	At the request of the National Park Service, the Little Bighorn Battlefield National Monument will be avoided by low-level flights (below 5,000 feet AGL) from one hour before to one hour after posted hours of operation and at other times as arranged. Supersonic flight would not be authorized in the proposed PR-1C airspace to reduce even remote possibilities of sonic booms at the National Monument.
AM-25	Why is the Air Force training with countermeasures particularly in the context of the current conflict and Al Qaeda's capabilities?	B-1 and B-52 aircrews train with all capabilities of the aircraft to be prepared for all contingencies. FEIS Section 2.8 describes the need for realistic training with countermeasures and Section 2.8.5 describes the countermeasures.
AM-26	Would like to see more stratification in the MOAs to create more flexibility.	As presented in FEIS Table 2.5-1, the Air Force and FAA have stratified the MOAs and created eight MOAS in PR-1 to create flexibility for transit of the area.
AM-27	How many aircraft will train simultaneously during LFEs and non-LFE training? Will there be limitations to the number of military aircraft occupying the airspace at one time? What types of aircraft will train in the airspace?	As described in FEIS Section 2.4.3, during normal training periods, there would be one to two aircraft training in each MOA complex for a total of four to eight aircraft training in the four MOA complexes. During LFEs, there would be approximately 20 aircraft training for two two-hour periods per day for one to three days per quarter up to 10 days per year. As discussed in FEIS Section 2.8, transient (occasional) users of the training areas include B-1s and B-52s from other bases; B-2s from Whiteman AFB; RC-135s from Offutt AFB; F-15s, F-16s, F-22s, and other fighters, tankers, and other aircraft various bases typically from the surrounding area.
AM-28	Comment response code not used.	
AM-29	Comment response code not used.	
AM-30	Do the aircraft carry ammunition?	Ammunition would not be carried for training in the proposed PRTC. Defensive countermeasures (chaff and flares) would be carried in the proposed PRTC as described in Section 2.8.5 of the FEIS.
AM-31	Airspace use figures are inaccurate.	Airspace use figures are derived from FAA IFR data, airport reports of operations, and airfield numbers of based aircraft. The airspace use numbers have been updated to 2013 reports and are accurate.
AM-32	Would like to see using AGL unless necessary to use MSL.	Variations in ground elevation under the airspace make using only AGL impractical. Altitudes are defined in accordance with FAA Order 7400.2. MSL, AGL, and FL are explained in Section 2.4.2 of the FEIS.

Comment and Response Matrix

Code	Description	Response
AM-33	Concern for coordinating firefighting or reconnaissance activities during fire season. Would like avoidance measures for fire traffic established June to September for no low-level flying training. Would DoD schedulers be able to reserve a 3-4 hour time slot in the late morning/early afternoon to facilitate VFR fire reconnaissance flights? This would support fire reconnaissance and response.	FEIS Section 2.3.1 describes mitigations incorporated in the proposal. The Air Force will work with tribes, individuals, and others to establish reasonable seasonal avoidance areas. The Air Force commits to expanding the current Memorandum of Understanding for routine fire reconnaissance flights as is done in the current Powder River airspace and the current Memorandum of Understanding. The Air Force would coordinate with BLM to update the Memorandum of Understanding to include the proposed PRTC. As suggested in Letter 3056 from the BLM at Miles City, the updated Memorandum of Understanding may be a part of a larger Memorandum of Understanding.
AQ = Air Quality		
AQ-1	Would quantities of fuel used for proposed training change air quality in Eastern Montana?	Section 4.4.3 of both the DEIS and FEIS provide analyses of potential air quality impacts that would occur from the project alternatives within all areas, including Eastern Montana. Appendix K includes the supporting air emission calculations. The results of the analyses determined that air emissions from each project alternative would produce less than significant air quality impacts to all areas of the project region, including Eastern Montana.
AQ-2	Need to study the effects of the increased number of planes that will use the area. Sulfur has been shown to modify cloud properties.	Sulfur oxides generated from the combustion of aviation fuels can convert to sulfates and sulfuric acid in the atmosphere, which can then take the form of cloud condensation nuclei and promote the development of both liquid cloud particles and ice crystals. Alternative A would generate small increases in SO_2 emissions compared to existing conditions – an increase of about three tons per year (see Table 4.4-1 of the DEIS and FEIS). These emissions would be spread over about 27,000 square miles of atmosphere and therefore would be adequately diluted to the point that they would not result in substantial changes to cloud formation at any locality.
AQ-3	Because of Air Force training in the area, air quality is not as good as it once was. The proposed actions will greatly increase air pollution. The only air sampling currently done within the existing training areas is the Crow Indian Reservation in Montana. How much will air emissions increase from existing levels due to increased Air Force activities in the area.	While the Lame Deer PM_{10} site is the only air monitoring station overlain by the proposed PRTC, due to its rural nature, the project region for the most part has very good air quality, as described in Section 3.4 of the DEIS and FEIS. Regarding the impact of proposed training activities to ambient air quality, please see the response to comment AQ-1 from letter 1048.

Comment and Response Matrix

Code	Description	Response
AQ-4	What is the justification for activation of the MOA/ATCAAs beyond the LFEs – this will require rerouting hundreds of flights per day around the airspace. The excess fuel associated with these altered flight trajectories and associated increased emissions do not appear to be addressed in the EIS.	The modified alternatives proposed in the FEIS no longer include the use of airspaces above FL260. Air emissions above FL260 would not degrade air quality. This lower airspace ceiling would minimally affect the routes of commercial airlines in the future and therefore would not result in an increase in emissions from future commercial airlines operations within the project region.
AQ-5	Concern about the potential emissions of toxins from the proposed aircraft trails and their effects on human health.	Section 4.4.3 of both the DEIS and FEIS provides analyses of potential air quality impacts that would occur from the project alternatives within all areas, including the Northern Cheyenne Reservation. The results of the analyses determined that air emissions from each project alternative would produce less than significant air quality impacts to all areas of the project region. In addition, Section 4.4.3 of both the DEIS and FEIS concluded that potential emissions of toxic air contaminants generated by the project training would result in less than significant impacts to public health at all locations within the project region.
AQ-6	The EIS should perform a Prevention of Significant Deterioration (PSD) increment consumption analysis for the Northern Cheyenne Reservation to determine the significance of air quality impacts from the proposed training activities.	The federal PSD requirements only apply to major stationary sources of emissions and not mobile sources, such as the project aircraft. Therefore, the air quality analysis in the EIS did not rely on the requirements of the PSD regulation to determine the significance of project air quality impacts. However, the air quality analysis in the EIS uses the Montana and National Ambient Air Quality Standards (NAAQS) as criteria to determine the significance of project air quality impacts. One of the main objectives of the PSD regulation and increment consumption analysis is to also ensure that proposed major stationary sources do not contribute to an exceedance of a NAAQS. PSD is addressed in Section 3.4.2 of the DEIS and FEIS and the relationship of PSD to the Northern Cheyenne Reservation is addressed in Section 4.4.3 of the FEIS.

Comment and Response Matrix

Code	*Description*	*Response*
AQ-7	Analyze the cumulative impacts of the proposed action to visibility on and near the Northern Cheyenne Reservation as well as acute visibility impacts from individual jet contrails.	Determination of the significance of an activity on visibility in a federal Class I area such as the Northern Cheyenne Reservation is typically associated with evaluation of stationary source emissions. Nevertheless, Section 4.4.3 of the FEIS has been revised to include an evaluation of cumulative impacts to visibility within the Reservation from the project. The results of the analysis determined that the minimal increases in emissions from the project would not substantially contribute to cumulative visibility impairment within the Reservation. Individual aircraft exhaust trails are composed of particulate matter and organic compounds that dissipate quickly and would not have a lasting effect on visibility. Water vapor from project aircraft emissions that would occur within the higher and coldest altitudes of the atmosphere also could develop into ice crystals and could form contrails. These contrails also would dissipate quickly and would not have a lasting effect on visibility within the Reservation. Therefore, the project would not produce significant impacts to acute visibility within the Reservation or any other portion of the project region.
BI = Biological Resources		
BI-1	Animals acclimate to noise and continue producing as under normal conditions.	As explained in both the DEIS and FEIS Sections 3.6 and 4.6, B-1 aircraft have been training in what constitutes PR-2 for several decades. There is no demonstration or claim that this training has affected birthrates or animal reproduction under the airspace.
BI-2	Concern that noise and vibrations will impact animal's fertility and ability to reproduce.	As explained in FEIS Section 4.6.3 and in cited scientific studies, close, loud, sudden noises combined with a visual stimulus produce the most intense reactions for livestock and wildlife. However, given the infrequency of low-level overflight and sonic boom effects at any given location under the airspace, noise and startle effects are unlikely to reach the level at which it would affect animals' ability to reproduce.

Comment and Response Matrix

Code	Description	Response
BI-3	Concern on the impact to Sage Grouse and may cause it to be listed as endangered.	FEIS Section 3.6.3.3 explains that the greater sage grouse is currently a candidate species. Section 4.6.3 explains that human surface activity has been shown to disturb sage grouse leks. Infrequent random overflights or rare sonic booms during ten days of LFEs would not be the type of noise that has been demonstrated to affect sage grouse leks. FEIS Section 2.8.5 quantifies the distribution of chaff and flare residual materials. Such a concentration would not be expected to impact the greater sage grouse.
BI-4	Concern of the startle effect on animals and that livestock and wildlife will not acclimate to the noise. Livestock and wildlife could be startled leading to injury or weight loss or cause wildlife to take refuge in other areas or to be driven from a Reservation. Concern for negative impacts during sensitive cattle operations such as branding, calving, or shipping in the spring and fall. Requests to avoid overflight of homes and corrals.	FEIS Section 2.3.1 (4b) presents mitigations and explains that the Air Force would continue the current practice of establishing reasonable temporary avoidance areas when notified by potentially affected individuals. This process is identified in FEIS Section 4.8.3.1. FEIS Section 4.6 describes the startle effects on animals, including threatened and endangered and other special status species. Low-level overflights may elicit a temporary behavioral response in wildlife, such as a change in posture or running a short distance; however, studies have also shown rapid habituation after initial responses in species such as pronghorn, elk, and bighorn. There is no evidence that overflight activity as proposed would drive animals away from a region such as a Reservation. Under the current use of Powder River training airspace ranching and recreational activities including hunting occur with minimal disruption. Overflights may affect but are not likely to adversely affect threatened and endangered species. FEIS Sections 4.6 and 4.9 describe startle effects upon domestic and ranch animals. Although infrequent, startle effects to individual animals could be an adverse impact. As described in Section 4.9 in the event of damage there is an established procedure for claims which begins by contacting Ellsworth AFB Public Affairs.
BI-5	Concern with chaff and flare residual materials in pastures near birthing livestock. Suggests chaff and flares are not released at 2,000 feet AGL when cattle and sheep are lambing.	FEIS Section 4.3 explains that chaff dispersion is projected to be 0.00377 ounces per acre annually. Chaff rapidly breaks down and becomes indistinguishable from soil. Section 4.6 explains chaff and flare effects and notes that any contact with chaff or flare residual materials would be highly unlikely. Chaff and flare plastic, Mylar, and/or paper residual materials can be deposited anywhere on the ground. As described in Sections 4.3 and 4.7 these residual materials could annoy people finding and identifying them, but there would be no physical effect on any animals, including birthing animals.

Comment and Response Matrix

Code	Description	Response
BI-6	Concern migration patterns will be disrupted. Suggestion for a mitigation measure to limit low-level operations in Powder River 4 during spring and fall bird migration.	FEIS Section 2.3 explains the mitigation measure for Modified Alternative A includes no PR-4 or Gap C Low MOA. Alternative C does not include PR-4 low level overflights. Modified Alternative B includes a PR-4 and Gap C Low MOAs, in which noise impacts would be slightly more intense under the PR-4 MOAs as stated in FEIS Section 4.2.3.2. In other areas, flights at altitudes below 3,000 feet AGL, where most birds migrate, would be random and occur approximately twice per day for 15 to 20 minutes for each mission requiring low-altitude training. There is no reason to believe that this infrequent activity would in any way disrupt migration patterns. FEIS Sections 3.3.3.4 and 4.6.3 address bird strike hazards and potential effects on migratory bird species or migration patterns including along the Central and Mississippi flyways
BI-7	Shadehill Reservoir, an important waterfowl refuge and staging and over-wintering area for ducks and geese, has been omitted from maps showing surface water.	As a result of the scale of the maps used to present the PRTC and the size of Shadehill Reservoir, the surface water map in the DEIS did not specifically call out the reservoir. The location of that reservoir has now been identified on FEIS Figure 3.5-2.
BI-8	Would like seasonal avoidance areas or other conservation measures to minimize impacts to federally listed threatened, endangered, or candidate species, particularly to reduce impacts to endangered whooping cranes, greater sage-grouse, and Sprague's pipit. A full analysis on direct and indirect effects from chaff and flare exercises on threatened and endangered species should be considered.	FEIS Section 2.3.1 explains that the mitigation measure for Modified Alternative A includes no Low MOA under PR-4 or Gap C, where the possibility of affecting whooping crane is greatest. Modified Alternative C also does not include PR-4 low level overflights or a PR-4 and Gap C MOAs. Modified Alternative B does include PR-4 and Gap C Low MOAs, in which noise impacts would be slightly more intense than currently as stated in FEIS Section 4.2.3.2. It would be possible to define avoidance measures in consultation with USFWS to avoid impacts on the whooping crane should Alternative B be selected. In other areas, flights at altitudes below 3,000 feet AGL, where most birds migrate, would be random and occur approximately twice per day for 15 to 20 minutes for each mission requiring low-altitude training. Sprague's pipit and greater sage grouse, both candidate species for federal listing, are potentially present over fairly broad areas under proposed project airspace. Analysis of the potential for overflight effects on avian species in Section 4.6.3 of the FEIS indicates a low possibility of adverse effect on these species from the proposed action or alternatives. Section 4.3 of the FEIS explains that chaff dispersion is projected to be 0.00377 ounces per acre annually. Chaff rapidly breaks down and becomes indistinguishable from soil. There are multiple studies which have not found either direct or indirect effects of chaff or flares

Comment and Response Matrix

Code	Description	Response
		on biological species (see FEIS Appendices C and D).
BI-9	Sprague's pipit has been added as an ESA candidate species since the publication of the Draft EIS and needs to be addressed under the Threatened, Endangered, and Other Special Status Species section of the EIS. Sensitive plant and wildlife data for wildlife species at the Little Bighorn Battlefield National Monument and Custer National Forest is incomplete. Recommend preparing a Biological Assessment/Evaluation.	A discussion of Sprague's pipit as an ESA candidate species has been added to FEIS Sections 3.6.3.3 and 4.6.3.1 and included in Tables 3.6-4 and 4.6-1. Information on sensitive plant and wildlife species at the Little Bighorn Battlefield National Monument and portions of Custer National Forest lying underneath airspace that would be used by the project has been reviewed, and Tables 3.6-4 and 4.6-1 have been updated with this information. The updated EIS analyses of Threatened, Endangered, and Other Special Status Species conclude that project elements "may affect but are not likely to adversely affect" threatened and endangered species. The Air Force submitted the updated analysis dated 30 May 2014 (FEIS Appendix E) to the USFWS and received their concurrence as noted in their letter to the Air Force dated 27 June 2014 found in Appendix E of the FEIS.
CM = Cumulative		
CM-1	The Keystone XL Company plans to install a 36-inch high-pressure pipeline though Harding County.	FEIS Chapter 5.0, Cumulative, includes the pipeline. There is no ground construction associated with the proposed changes in airspace. FEIS Section 2.3.1 explains flare release altitude limitations and overflight avoidance of construction and mining sites where sensitive electronics could be affected. It would be almost impossible for chaff, flares, or electronic emissions to impact any pipeline.
CM-2	Would like more discussion regarding threat emitters or other ground assets. Request for information on how additional NEPA analysis would be conducted on the future emitters and notification of whether emitters would be placed within the Little Bighorn Battlefield National Monument viewshed.	The proposed PRTC has no new ground assets. As explained in FEIS Section 2.5.7, new ground-based threat emitters are not part of the proposed action. FEIS Section 5.1 explains that threat emitters, if sited, would have separate NEPA evaluation.
CM-3	Concern the full impact of the proposal will not be known for several years and that it may be too late to mitigate any impacts once they are known.	As explained in FEIS Section 3.8, the existing Powder River MOAs have a somewhat greater proportion of rangeland and smaller proportion of agricultural land than the entire potentially affected area. Most land use types are represented under existing airspace and have effectively been overflown for decades by B-1 training aircraft at the same altitudes proposed for the expanded airspace. The only differences are tribal land and designated urban land which are not under existing MOAs (See FEIS Section 3.9.).

Comment and Response Matrix

Code	Description	Response
CM-4	Southeast Montana is being considered for wind energy development with new wind farms on high ridges and plateaus. Future wind turbines may be considered in project's planning phase.	Existing and potential wind farms are considered throughout the analysis, including FEIS Sections 3.8, 3.9, 4.8, and 4.9. Existing wind farms are mapped and avoided, and future wind farms, when approved, would also be mapped and avoided. (See FEIS Appendix J for lighting.) The proposed action would not inhibit the development of future wind farms or other industrial land uses. (See FEIS Section 4.8.)
CU = Cultural Resources		
CU-1	Some towns in the document are misclassified as ghost towns.	All ghost towns beneath the airspace were reviewed; some were found to include permanent resident populations, but are still classified ghost towns. These are noted in Table 3.7-4 of the FEIS.
CU-2	Concern for disruption of the use or character of cultural, sacred, and historic sites (including newly listed sites such as the Evangelical Lutheran Trinity Church) and activities and protection of those sites and activities, including protecting landscapes, soundscapes, and scenery. Suggests consultation with all tribes and reservations to which Little Bighorn Battlefield National Monument is highly significant. Suggests additional definition of undertaking to allow a survey to be conducted. Concern the analysis does not include impacts to the North Cave Hills, South Cave Hills, or Slim Buttes cultural landscapes in Harding County, SD.	Following consultation regarding the proposed action with ACHP, SHPOs from MT, WY, ND and SD, Crow Tribe, Northern Cheyenne Tribe, Standing Rock Sioux Tribe, Cheyenne River Tribe, FAA and NPS, the Air Force created a modified PRTC proposal ("Modified Alternative A"). The "Programmatic Agreement among 28th Bomb Wing, Ellsworth Air Force Base, the State Historic Preservation Offices of Montana, North Dakota, South Dakota and Wyoming, and the Advisory Council on Historic Preservation Regarding the Proposed Development, Implementation and Operation of the Powder River Training Complex" (FEIS Appendix N) is among consulting parties comprised of signatories (28 BW, SHPOs from MT, ND, SD and WY, and the ACHP) and invited signatories (FAA, NPS, and Crow Tribe). The Cheyenne River Sioux Tribe, Northern Cheyenne Tribe and Standing Rock Sioux Tribe have also been invited to sign, but have not yet elected to do so. The modified alternative and the Programmatic Agreement address areas of avoidance, modes of flying, and procedures for notification regarding special avoidance areas or times for sensitive resources and other communications. Some locations under the ATCAAs and the Gap MOAs would never see low level overflight or, at most could see LFE low level overflight one to three days per quarter up to 10 days per year. Although Section 106 consultation has concluded for the purposes of the EIAP, the Air Force will continue to consult with the tribes and other stakeholders. FEIS Section 3.7 explains consultation conducted by the Air Force, including Government-to-Government consultation. The Section also includes newly listed sites. FEIS Section 4.7 explains the stipulations agreed to in the Programmatic Agreement. FEIS Section 2.3.1 explains that the Air Force will also work with individuals and organizations to identify sensitive noise areas and periods of avoidance.

Comment and Response Matrix

Code	*Description*	*Response*
CU-3	Concern the Native American lands are being given more concessions such as avoiding cultural and religious activities.	Modified Alternative A describes changes in airspace use that address cultural resources concerns expressed by all stakeholders, not just Native Americans. FEIS Section 3.7 explains that Native American lands have a special relationship requiring Government-to-Government consultations. The Programmatic Agreement described in CU-2 stipulates avoidance, minimization and mitigation procedures available to the signatories, including not only the tribes but the ACHP, the SHPOs and others. Potential environmental consequences to public, private, and tribal lands are all addressed in the FEIS. (See FEIS Section 4.8.)
CU-4	Would like economic relationship with the Air Force.	The Air Force is willing to explore opportunities to enhance economic relationships with tribes.
DO = Description of Proposed Action and Alternatives		
DO-1	Would like more clarity on the proposed flying levels of the alternatives.	FEIS Sections 2.5-2.8 describe each alternative's altitudes and estimated time at altitudes for training. Section 2.4 presents the scheduled MOA times and altitudes. Section 4.9 explains the average number of low-level overflights. An average of six to nine low-level overflights of any given location, depending on alternative, is seen as an unavoidable adverse impact. Information would be made available on airspace use for training.
DO-2	Would prefer Alternative B or some variation of the preferred alternative that excludes low-level flights-specifically to avoid low-level flights over Little Bighorn Battlefield National Monument, interference with emergency response aircraft flights over the Ashland Ranger District of the Custer National Forest, and least impact to Greater sage grouse in Wyoming and Montana.	FEIS Section 2.3.1 explains mitigations to reduce potential effects on the Little Bighorn Battlefield National Monument. Section 4.3 explains that military training would be halted in the affected airspace due to any ground safety emergency that involves a life-flight. Section 4.8 explains land use impacts. Section 4.6 explains overflight effects on the greater sage grouse.
DO-3	Would prefer the floor no lower than 5,000 feet AGL and no supersonic flight.	Chapter 1.0 of the FEIS explains the purpose and need for the airspace, the requirement for training down to 500 feet AGL, and the need for realistic battlefield tactics at supersonic speeds during one to three days of quarterly LFEs. Chapter 2.0 of the FEIS describes the alternatives and estimated time airspace would be scheduled for training. MOA segments and multiple MOA have been included to allow for IFR transit.

Comment and Response Matrix

Code	Description	Response
DO-4	Would prefer the floor no lower than 10,000 to 15,000 feet MSL, particularly in new MOAs.	Chapter 1.0 of the FEIS explains the purpose and need for the airspace, the requirement for training down to 500 feet AGL, and the need for realistic battlefield tactics at supersonic speeds during one to three days of quarterly LFEs. Chapter 2.0 of the FEIS describes the alternatives and estimated time airspace would be scheduled for training.
DO-5	Alternative C would have less impact on the economy and quality of life, as well as bird migration routes including the endangered whooping crane.	FEIS Section 2.3.1 explains the mitigation measure for Modified Alternative A includes no PR-4 and Gap C Low MOAs. Modified Alternative C does not include PR-4 low level overflights. Low altitude overflight would be avoided in PR-4.
DO-6	Would like more discussion on Alternatives Considered but not Carried Forward were not further analyzed.	FEIS Sections 2.10 and 2.11 explain selection standards and application of those standards. FEIS Sections 2.10.5.4 through 2.10.5.6 explain the need for training locations that are in close proximity to Ellsworth AFB.
DO-7	Requests the proposed eastern border of PR-4 to be modified so it does not overlap tribal lands.	FEIS Section 2.3.1 explains the mitigation measure for Modified Alternative A includes no PR-4 or Gap C Low MOAs. Modified Alternative C does not include PR-4 or Gap C low level overflights. Tribal lands with PR-4 would not be subject to low level overflights with either of these alternatives.
EJ = Environmental Justice		
EJ-1	Concern the Air Force is discriminating by acknowledging the tribe's various religious, cultural, and traditional activities and are not making the same concessions to other individuals who have voiced opposition. EO 12898 as described in Appendix F of the Draft EIS, essentially insures the fair treatment of all people regardless of race, color, national origin, or income.	DEIS Section 3.7 explained that Native American lands have a special relationship requiring Government-to-Government consultations. Potential environmental consequences to public, private, and tribal lands are all addressed in FEIS Section 4.8. As described in DEIS Section 3.10 and Appendix F of the FEIS, EO 12898 directs that all agencies "To the greatest extent practicable and permitted by law, and consistent with the principles set forth in the report on the National Performance Review, each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States and its territories and possessions" (available at http://www.archives.gov/federal-register/executive-orders/pdf/12898.pdf). See also response to EJ-2.

Comment and Response Matrix

Code	Description	Response
EJ-2	Concern that low-income (or low population) areas under the airspace will become the location used for this proposal. Impacts of the PRTC would be more heavily felt by the tribal community than other groups.	Both the DEIS and FEIS in Section 1.4 and 1.5 discuss the purpose and need of the Proposed Action, including the selection criteria used to choose the locations for implementing the Proposed Action. Reasonable alternatives, modified as a result of public hearings on the DEIS, public comments received, and extensive consultations and special outreach with the public, agencies, and tribal representatives, are presented in FEIS Section 2.3.1. Analysis of the effects of these modified alternatives is presented in FEIS Sections 3.10, 4.9, and 4.10. Section 3.10 quantifies the minority and low-income population and youth population under the airspace. Any person under the airspace, minority or non-minority, could experience an average of one sonic boom per day during the not more than 10 days per year of LFE training. Individuals under the low MOAs could also experience low-altitude overflights of a training aircraft between 500 feet to and including 2,000 feet above the ground. Low-altitude overflights in low MOAs would result in unavoidable uncertainty, startle, and adverse noise impacts. These impacts would apply equally to any minority or non-minority persons regardless of income or age under any of the low MOAs. Modified Alternatives A and C avoid low-altitude overflight of Native American Reservations, including the Northern Cheyenne Reservation, except for portions of the Crow Reservation. Modified Alternative B does not include low-altitude overflight of the Crow or Northern Cheyenne Reservations but does include low altitude overflight of portions of the Cheyenne River and Standing Rock Reservations. Section 4.10 explains that low-altitude training in PR-1A, PR-1C, and PR-1D MOAs overlie portions of the Crow Reservation that have a minority population in excess of 50 percent. An adverse impact not adequately or acceptably mitigated, which cannot otherwise be avoided, presents the potential for a disproportionately high and adverse human health or environmental effect on that population. Under Modified Alternatives A and C, implementation of the mitigations identified in this EIS, including those developed through extensive consultations and outreach with the affected populations to resolve adverse effects under the NHPA, would adequately or acceptably mitigate adverse impacts to such a degree that they are not significant under applicable standards. Consequently, these modified alternatives in conjunction with specified mitigations would not result in disproportionately high and adverse human health or environmental effects for environmental justice purposes.

Comment and Response Matrix

Code	Description	Response
GE = General		
GE-1	In support of the proposal.	Thank you for your interest and participation in the NEPA process. Your comment has been entered into the record.
GE-2	Not in support of the proposal. In favor of the No Action Alternative.	Thank you for your participation in the NEPA process. Your comment has been entered into the record.
GE-3	Statements that the proposal is unfair, unnecessary, present an unreasonable burden on people affected, and undeserved by the people affected. Concern the Air Force proposal is unjustified for training requirements.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal. The environmental process described in Section 2.12 of the FEIS is designed to include public and agency perspectives for review by decision-makers. Section 2.4 describes the proposal, and Section 1.2 describes the reason for the training requirements. Sections 2.10.4 and 2.10.5 explain the limitations on current training. The screening criteria for identifying alternative training locations are described in Section 2.11.
GE-4	Comment that the Ellsworth Task Force has not volunteered Rapid City to be overflown.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal. Your comment has been included in the FEIS, which will be considered before the Air Force makes a final decision.
GE-5	Concern the Air Force and FAA will disregard the public comments and taxpayers to get what they want and forget the meaning of 'good neighbor'. Statements that the Air Force is not trusted due to denial of negative impacts in the past and lies and broken promises from other government agencies, Concern for too much government interference near food and livestock production. Suggestions for annual meetings between Air Force and citizens to listen to local concerns and give local residents a chance to listen to Air Force concerns.	FEIS Section 2.3.1 describes the mitigations incorporated into the PRTC proposal in direct response to public and agency concerns. This includes advanced notifications to the public of LFEs. The Record of Decision (ROD) will be legally binding. Any and all mitigations contained in the ROD will become the legal obligation of the Air Force. With the execution of the Programmatic Agreement, in particular stipulation #VII, the Air Force would provide a summary report detailing the training activities held and other issues. The Air Force has programs designed for community relations, including the Mid-Air Collision Avoidance program. Under this or another suitable program, the Air Force will consider all requests for meetings in communities beneath the proposed PRTC airspace. The Air Force will monitor the effectiveness of these programs through the mitigation and monitoring program to be established as part of this proposal.
GE-6	Concern the military is trying to instill fear in the American people and looking for wars to fight to get what they want.	The purpose of the proposed PRTC is to provide the best training possible for aircrews. FEIS Sections 2.10.4 and 2.10.5 explain the limitations on current training. The selection criteria for identifying alternative training locations are described in FEIS Section 2.10 and 2.11.

Comment and Response Matrix

Code	Description	Response
GE-7	Questions the sovereignty of the U.S. government for airspace above private property. "Reasonable and ordinary use is the airspace above your property" is often litigated and routinely protected as a property right. Resolution adopted by the Standing Rock Tribe in 2008 states the use of the airspace was reserved for the tribe pursuant to the Treaties of 1851 and 1868 at Fort Laramie.	FEIS Section 1.6 explains that navigable airspace is under the jurisdiction of the FAA.
GE-8	Concern that a live person at the base cannot be reached to handle complaints, questions, or damage claims. Whom do we contact for rapid response? Previous attempts to resolve a complaint have received a poor response or damage claims are not paid.	The Air Force Public Affairs Office is charged with the responsibility of handling public inquiry. FEIS Sections 2.8.5.2 and 3.3.3.2 identify the process for addressing claims.
GE-9	Supports a well-trained military and supports its mission.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal.
GE-10	Can a test-run be done first for feedback before charting the MOAs? Are there any procedures to suspend it or modify it once the airspace is charted if there is a problem?	There is no provision for a test-run of MOAs in the applicable FAA requirements. However, the area under PR-2 has been overflown by B-1 and other training aircraft for many years. FEIS Section 2.3.5 describes the process, after adoption of mitigations to monitor the effectiveness of the mitigations to determine the need, if any, for adjustments.
GE-11	Would like to work together with the Air Force to maintain all missions. Must address the needs of all airspace users. Monitoring and evaluation of the Proposed Action should be ongoing. Previous coordination with stakeholders may have led to additional alternatives but the Air Force was unwilling. Requests for the Air Force to coordinate the development of an alternative.	To the address the needs of all airspace users and other stakeholders, as expressed during public outreach, agency review and tribal consultation, Air Force developed many mitigations, which are listed in FEIS Section 2.3.1. FAA Order 7400.2 states: "Although the FAA must protect the public's right of freedom of transit through the airspace, full consideration shall be given to all airspace users, to include national defense; commercial and general aviation; and space operations."
GE-12	Requests information on the proposal.	Individuals who requested copies of the EIS have received copies. FEIS Section 1 describes the reason for the training requirements and Section 2.2 describes the components of the proposed airspace. FEIS Section 2.10.5 identifies the limitations on current training. The selection criteria for identifying alternative training locations are described in FEIS Section 2.11.
GE-13	Who conducted the studies discussed in the document?	The FEIS provides the list of preparers for the technical analysis in Chapter 7.0, and lists the reference studies used in this analysis as well as the sources of those studies in Chapter 6.0.

Comment and Response Matrix

Code	*Description*	*Response*
GE-14	Do not support non-LFE portion of the proposal. LFE use of the airspace appears manageable but non-LFE use impacts a large volume of airspace on a daily basis and will put burden on hundreds of civil aviation and non-DoD flights every day.	As described in Chapter 1.5 of the FEIS, the Air Force needs additional airspace for realistic, high-quality, local training in addition to LFE training. The Air Force worked closely with the FAA to address impacts to commercial traffic. FEIS Section 2.3.1 describes the mitigations to address public and agency concerns.
GE-15	The footnote for Table 3.2-3 should include "Federal Aviation Administration Advisory Circular, FAA AC-91-36D)."	FAA AC-91-36D recommends no overflight below 2,000 feet AGL over the Little Bighorn Battlefield National Monument. A mitigation has been incorporated into the proposal (see FEIS Section 2.3.1).
GE-16	Would like a discussion on BRAC commission voting to retain Ellsworth AFB and its B-1 fleet without determining its current airspace could meet its mission needs.	A response is unnecessary because the comment raises a concern which is outside the scope of the proposed action nor does the comment address the adequacy of the DEIS or the merits of alternatives discussed in it. The BRAC Commission report can be found at http://www.brac.gov/finalreport.html.
LU = Land Use		
LU-1	Concern the quality of life, privacy, and integrity of the land would be impacted. Wants the integrity and stewardship of the land and quality of life maintained.	FEIS Sections 3.8 and 4.8 explain the existing land use and potential consequences, and Sections 3.9 and 4.9 explain the social and economic relationship of the people, communities, and land. Section 4.9 describes the estimated average extent of overflight at low altitudes and the mitigations are described in Section 2.3. Section 4.8 describes the consequences to different land uses, including private and public lands. Some individuals expressed the perspective that any low level training would be an adverse impact.
LU-2	Concerned about the sudden overflight and noise impacts to the serenity of the land and people's way of life including recreation. Permanent avoidance areas may be needed.	FEIS Sections 3.2 and 4.2 explain the existing conditions and noise consequences. Section 4.9 describes the estimated average extent of low-level overflight and potential startle effect. The Air Force has incorporated mitigations, including establishment of reasonable temporary or seasonal avoidance areas or other measures identified in Government-to-Government consultation with affected tribes (see FEIS Section 2.3). Some individuals see military training and related startle or noise impacts as unacceptable to their quality of life and an adverse impact.

Comment and Response Matrix

Code	Description	Response
LU-3	Concerns the proposal will damage or eliminate ranches/farms and the ranching/farming lifestyle.	FEIS Section 4.8 explains that B-1 training aircraft have overflown ranches and farms under the existing Powder River A and B MOAs (which are essentially PR-2) for decades. The ranching/farming/hunting lifestyle continues under this airspace and, in many ways, the ranches and farms are comparable to, or the same as, ranches and farms under the proposed additional airspace. FEIS Section 4.9 explains that the average number of low-level overflights per year would be approximately six to nine. This level of training activity could cause annoyance but, based upon the experience under the existing MOAs, would not significantly impact ranches, farms, or the ranching lifestyle. Individuals under the proposed airspace could see sudden overflight startle impacts as a significant impact.
LU-4	Crop land acres have not been adequately identified in the analysis. Does not account for crop acres coming out of the Conservation Reserve Program (CRP).	FEIS Section 3.8 lists agricultural land area from available GIS data under the existing Powder River MOAs and under each proposed MOA. Section 4.8 explains why the proposed PRTC would not adversely affect land use under the airspace.
LU-5	Concern of losing prime hunting areas.	FEIS Section 4.8 describes the importance of hunting land use under the proposed airspace. Section 4.9 explains an average of six to nine low-altitude overflights could occur per year in any given location under a low MOA. Prime hunting areas are located under the existing Powder River A and B MOAs (essentially the same as PR-2) where B-1s have been training for decades. Section 4.8 explains that low-altitude training and hunting coexist throughout the west.
LU-6	The land use numbers are not shown on the maps and can't see on the maps how much acreage is included in the area.	In FEIS Section 3.8, Table 3.8-2 presents land use numbers calculated using geographic information systems. GIS data do not always coincide; however, the overall land use numbers presented in the report represent the best available information.
LU-7	Property is under the current airspace or overflown by aircraft near Minot. No observable negative impact. Ranchers have requested no-fly zones during sensitive times for livestock with a phone call to Ellsworth AFB.	FEIS Section 4.8 explains that aircraft have overflown what is effectively the proposed PR-2 for decades. Section 2.3.1 explains that the Air Force will continue to work with ranchers to establish avoidance areas through identified mitigation measures.
LU-8	Question if the Air Force adheres to county land use plans. Statement that individual county land use plans should be taken into consideration in the EIS analysis.	FEIS Section 4.8.1 explains that PRTC would not place restriction on land use or land use plans. Plans for energy development or related structures which could project into the airspace are considered in Section 4.9. (See also FEIS Appendix J.)

Comment and Response Matrix

Code	*Description*	*Response*
LU-9	Concerned about the visual effects of large aircraft flying over, contrails, and chaff and flare debris.	FEIS Section 4.9 describes the estimated average frequency of low-flying aircraft. Sudden overflight visual and startle impacts from aircraft and rare visual impacts from residual pieces of chaff or flares are adverse impacts. Aircraft emissions associated with the use of proposed airspace would not impact visibility (FEIS Section 4.4.3.1 and Section 5.1.2.1.4). At lower altitudes, individual aircraft exhaust trails can be visually detected for a brief period due to emissions of particulate matter and organic compounds. Below 3,000 ft AGL, these exhaust emissions rapidly dissipate (see FEIS Section 4.4.3.1). Contrails, or condensation trails, are an existing condition above the proposed PRTC airspace. Contrails are visible water vapor trails from aircraft engines associated with specific meteorological conditions and produced by high-altitude aircraft overflight. Commercial overflights of the four-state region are the primary contributors to these temporary artificial clouds. Overflight of military training aircraft could create condensation trails depending on flight altitude and meteorological conditions. Although contrails could be seen as an intrusion into an otherwise clear sky, such contrails, whether formed by commercial or military aircraft overflight, would not have an adverse effect upon tribal or other lands under the proposed airspace. By eliminating military flights above FL260 the Modified Alternatives would greatly reduce the potential formation of contrails. Effects of the visual intrusion of PRTC training activities on historic properties are addressed in FEIS Section 4.7.2.1.
NA = Native American		
NA-1	Concern the consultation with the tribal governments will be labeled simply a fiduciary responsibility. There is no guarantee that comments will be implemented.	Ellsworth AFB has conducted Government-to-Government consultations with tribal governments and explained all aspects of the proposed airspace changes. Over the course of the past six years, Ellsworth AFB has consulted with tribal governments in compliance with Section 106 of the NHPA, and invited the tribes to be signatories to a Programmatic Agreement that includes stipulations specifying measures that resolve tribal concerns. The Air Force will also continue to consult with the tribes on a Government-to-Government basis.

Comment and Response Matrix

Code	Description	Response
NA-2	Separate and private hearings were conducted at the reservations and comments were not submitted specifically to aeronautics commission. Concern the tribal governments comments will not be made available or included in the Final EIS.	All written comments and transcripts received on the DEIS are included in the FEIS. (See Section 2.12). The FAA is a cooperating agency (see Section 1.6) in this EIS and has participated in the public hearing process. The FAA reviewed the EIS and related appendices and, subsequent to the Air Force Record of Decision (ROD), the Air Force anticipates that the FAA will adopt the FEIS, issue its own ROD and then publish the new airspace in the Billings Sectional Aviation Chart.
NA-3	Concern the tribal government is not recognized as having a legal or constitutional relationship with the United States.	Ellsworth AFB has made special efforts to conduct Government-to-Government consultations with tribal governments as was described in DEIS Section 3.7. The obligation for federal agencies to engage with Native American tribes on a Government-to-Government basis is based on federal, statutes, executive orders (EOs), regulations, and policies. These include NHPA of 1966, the Native American Religious Freedom Act, Presidential Memorandum on Government-to-Government Relations (April 29, 1994), EO 13007 (Indian Sacred Sites) and EO 13175(Consultation and Coordination with Indian Tribal Governments), and DoD Instruction 4710.02 (DoD Interactions with Federally Recognized Tribes). These consultations, between Ellsworth AFB and the tribes, have included explanations of all aspects of the proposed airspace changes, and have resulted in some of the changes made in Modified Alternative A. As described in FEIS Section 4.7, the Air Force has executed a Programmatic Agreement that stipulates measures that resolve adverse effects to historic properties, religious ceremonies and important tribal events under the PRTC (refer to Appendix N). Furthermore, the Air Force will continue to consult with the tribes on a Government-to-Government basis.
NA-4	The importance of the Native American ceremonies and religion is not adequately identified or analyzed in the Draft EIS. Military interference with and encroachment of sacred rights and religious practices is offensive, distracting, disrupting, and disrespectful. Ceremonies take place throughout the year-not just spring and summer. Suggestion for further consultation with affected tribes including tribes which conduct ceremonies at Little Bighorn Battlefield National Monument.	DEIS Section 3.7 explained the importance of ceremonies and Government-to-Government consultation. FEIS Sections 2.3 and 4.7 explain the provisions of the Programmatic Agreement, which includes avoidance areas and times, and specifies that when Native American ceremonial and religious sites are identified, the Air Force will consult to determine reasonable avoidance altitudes and times. Further consultation has resulted in the mitigations described in FEIS Section 2.3.

Comment and Response Matrix

Code	Description	Response
NA-5	Suggests mitigations for no training during ceremonies throughout tribal homeland and over sacred grounds. Suggests no low-level overflights or sonic booms over Standing Rock Indian Reservation from June-August.	FEIS Sections 2.3 and 4.7 explain that during Government-to-Government consultations, the Air Force explained that when Native American ceremonial and religious sites are identified, the Air Force will consult to determine reasonable avoidance altitudes and times. Also, as discussed in FEIS Sections 4.7.2.1, and 4.7.2.3, a "Programmatic Agreement among 28th Bomb Wing, Ellsworth Air Force Base, the State Historic Preservation Offices of Montana, North Dakota, South Dakota and Wyoming, and the Advisory Council on Historic Preservation Regarding the Proposed Development, Implementation and Operation of the Powder River Training Complex" (Appendix N) is among consulting parties comprised of signatories (28 BW, SHPOs from MT, ND, SD and WY, and the ACHP) and invited signatories (FAA, NPS, and Crow Tribe). The Cheyenne River Sioux Tribe, Northern Cheyenne Tribe, and Standing Rock Sioux Tribe have also been invited to sign, but have not yet elected to do so. As explained in FEIS Section 2.3.1, Modified Alternatives A and C include a minimum training altitude of 12,000 feet MSL above the Standing Rock Indian Reservation, Cheyenne River Sioux Tribe, and Northern Cheyenne Indian Reservations. Supersonic training would be scheduled once per quarter for 1 to 3 days for a maximum of 10 days per year. An average of one sonic boom per LFE day could be experienced at any given location under the proposed airspace.
NA-6	Request for more information on the frequency and amount of fuel or chaff dropped and flight time over tribal lands. Suggestion to limit the use of chaff over tribal lands and start using new technologies for invisibility.	FEIS Section 2.3 explains that there is no proposed deployment of ordnance on tribal lands or any other lands under the airspace. The Air Force has identified fuel jettison areas and none are over tribal lands. FEIS Section 2.8 describes chaff and flare deployment as defensive countermeasures and explains the quantity of chaff (0.00377 ounces per acre per year) or flare residual materials (one plastic or Mylar piece per 149 acres per year) which could be randomly distributed anywhere under the training airspace, including on tribal lands. FEIS Section 2.8 also contains information on the frequency of aircraft use of the airspace as part of the Proposed Action.
NA-7	Concern there is not enough respect for the Native American lands and their quality of life.	The Air Force has sought to work with Native American tribal representative to identify sensitive sites. DEIS Section 3.7 explained the importance of ceremonies and on-going Government-to-Government consultation. FEIS Section 4.7 explains that when Native American ceremonial and religious sites are identified, the Air Force will consult to determine reasonable avoidance altitudes and times.

Comment and Response Matrix

Code	*Description*	*Response*
NA-8	Concern the proposal is in violation of treaties, specifically the Fort Laramie Treaty of 1868, for the absolute and undisturbed use and occupation of tribal lands. Suggestions that these treaties include airspace over tribal lands	DEIS Section 3.7 described the Fort Laramie Treaty of 1868. There is no ground construction proposed as part of the Powder River Training Complex. FEIS Section 1.6 explains that the FAA has sole responsibility of navigable airspace in the United States and associated offshore and other areas.
NA-9	Were the meetings with the Native Americans Government-to-Government meetings? If not, why weren't they advertised as public hearings? Thought the purpose of the meeting was for the Air Force to give a presentation and was not going to include public comment or a court proceeding hearing. If a public hearing had been advertised more people would have attended.	Meetings with tribes are conducted on a Government-to-Government basis. Meeting participants are invited at the direction of the tribe. Such Government-to-Government meetings are in addition to advertised public hearings on the DEIS. (See DEIS Section 3.7.) The results of Government-to-Government consultations have been incorporated into the analysis as described in FEIS Sections 4.7, 4.10, and others.
NA-10	Concerned about the sudden overflight and noise impacts to the serenity of the land and Native American way of life. Permanent avoidance areas may be needed.	FEIS Section 2.3 explains the mitigations incorporated to support reasonable seasonal and temporary avoidance areas. Also FEIS Section 4.7.2.3 describes the stipulations of the Programmatic Agreement the Air Force has executed, including avoidance areas, times and dates, and a process for continued consultation as specific concerns arise regarding additional identification of Native American ceremonial and religious sites or other areas of concern. The Air Force will consult to determine reasonable avoidance altitudes and times. See Appendix N for the full text of the Programmatic Agreement.
NA-11	Suggests a Memorandum of Agreement as part of a Government-to-Government relationship between the tribes and the Air Force.	Modified Alternative A incorporates a number of changes in airspace use in response to tribal concerns. Also, as described in FEIS Section 4.7.2.3, the Air Force, SHPOs and ACHP developed a Programmatic Agreement that resolves adverse effects that could result from the proposed action, through stipulations concerning avoidance, minimization or mitigation of adverse effects to historic properties, religious ceremonies and important tribal events under the PRTC. Refer to FEIS Appendix N for the complete and final text of the Programmatic Agreement.
NA-12	History of Native Americans portrayed in the DEIS includes incorrect information. Suggested corrections are provided.	Additional edits incorporated into the EIS in response to specifics provided by the tribes.
NA-13	Concern for illegal dumping of hazardous materials, chemical, nuclear, and other waste is being dumped.	As explained in Chapter 2.0 of the FEIS, no ground construction is included as part of the Proposed Action. Chapter 5.0 of the FEIS explains that threat emitters, if sited, would have separate NEPA evaluation. There are no proposed ground assets and no proposed construction or other wastes.

Comment and Response Matrix

Code	Description	Response
NO = Noise		
NO-1	Concern with the noise increase from aircraft in holding patterns waiting to land.	As described in Section 2.5 of the FEIS, although the sorties may increase from FY2011 activity, total flight operations would not be expected to exceed those analyzed and published in the 2008 Ellsworth AFB Air Installation Compatible Use Zone (AICUZ), which is publically available at http://www.ellsworth.af.mil/shared/media/document/AFD-090428-076.pdf. The AICUZ study, which is incorporated by reference, identifies the noise levels associated with flight operations in the vicinity of Ellsworth AFB.
NO-2	Concern for the disruptive nature of sonic booms and low-level overflights including startle effect and damage to buildings, windows, and other property.	As described in FEIS Section 4.2, low-level overflights and sonic booms would be infrequent. Overflights exceeding 65 dB SEL would occur once on 4 out of 10 days on average. An average of one sonic boom per day could be experienced on the not more than 10 LFE days per year. Startle effects generated by noise would be relatively rare, and the likelihood of significant structural damage from a sonic boom is very low, although it could occur. Any claims from Air Force-related damage would begin by contacting Ellsworth AFB Public Affairs.
NO-3	Concern for the accuracy and scientific integrity of the B-1 aircraft noise predictions. Concern the effects are underestimated. When the B-1s use their afterburners, the noise is greater than reported.	FEIS Appendix I describes the noise models and accuracy of those models. DEIS Section 3.2 described the noise from B-1 afterburner use, and Appendix I, Table I-1, presents the noise level without afterburners. The numbers are measured numbers. FEIS Section 4.8 presents the consequences of SEL noise.

Comment and Response Matrix

Code	Description	Response
NO-4	The noise numbers are misleading and vague because they are averages and generalized. They are not always consistent. No specific discussion is provided as to how thresholds of significance were defined in determining impacts of noise on the resources described in the document. The 55 DNL dB threshold cited in the DEIS does not adequately address disruption of tranquility or disruption of solitude at national parks. No specific discussion is provided as to how thresholds of significance were defined in determining impacts of noise.	Section 3.2 of both the DEIS and FEIS explain that both average and single event level noises are included to provide a complete noise picture to the public, agencies, and decision-makers. FEIS Appendix I explains FAA noise policies. DEIS and FEIS Section 3.2.2 discussed factors involved in defining significance with regards to noise impacts. Neither the Air Force nor the FAA has specific significance thresholds for properties like the Little Bighorn Battlefield National Monument, which call for special consideration in determining noise impacts (see DEIS Section 3.2.2). Noise impacts on such properties are determined based on the context and intensity of the impacts on the resource on a case-by-case basis. FEIS Section 4.2.3 includes specific noise results for the National Monument, using single-event metrics (i.e., SEL and L_{max}) in addition to DNL. In a Programmatic Agreement under Section 106 of the National Historic Preservation Act (see Appendix N of the FEIS), the Air Force and the National Park Service have agreed that the Air Force will partially mitigate the effects of the PRTC on the National Monument (e.g., noise) by implementing specific measures, including a minimum training altitude of 5,000 feet AGL from one hour before to one hour after posted hours of operation.
NO-5	Concern with the increase in noise, including sonic booms and vibrations, with low-flying aircraft and impacts to sleep, hearing, startle effects to humans and wildlife, annoyance, prayer, ceremonies, and other day-to-day activities. Suggestions for limitations set on aircraft noise including restrictions of noise to reasonable hours. Suggestions for analysis to use single-event noise rather than using average noise.	FEIS Section 2.5 describes training periods and the hours when training could occur. After dark flights are required for realistic training. FEIS Section 4.2 describes noise impacts, including sonic booms, and presents the change in average noise levels. FEIS Section 4.2 identifies the calculated number of times per training day when different sound levels would be exceeded. FEIS Section 4.2 also explains that individual aircraft operating at low altitude may have single events as loud as 133 dB sound exposure level (for a B-1 using afterburners at 500 feet AGL). As explained in FEIS Section 4.7.3.1, training aircrew avoid buildings during this fly-up maneuver. Supersonic would be proposed above 20,000 feet MSL for bombers and above 10,000 feet AGL for fighters. FEIS Section 2.8 describes the minimum altitude for supersonic maneuvers. FEIS Appendix I explains noise measures in more detail.
NO-6	Does altitude have a factor in the decibels of noise reaching the ground?	DEIS Section 3.2 and FEIS Section 4.2 provide noise effects based upon aircraft altitude above ground level. This means that an aircraft flying at 10,000 feet MSL above 3,000-feet MSL terrain would have a noise effect comparable flying at 7,000 feet AGL.

Comment and Response Matrix

Code	*Description*	*Response*
NO-7	Are there any ultrasonic magnetic waves involved in sonic booms?	DEIS Section 3.2 and Appendix I of the FEIS explain that sonic booms are created by sound pressure waves, not magnetic waves. There are no ultrasonic magnetic waves involved in sonic booms. The compression of air does result in sound effects beyond those audible to the human ear. Some sounds inaudible to humans can be heard by animals.
NO-8	What would the decibels be at 10,000 feet AGL?	FEIS Appendix I, Table I-1 and I-2 describe the decibel levels for different aircraft types flying at different altitudes AGL. FEIS Section 2.11 presents sonic boom overpressures for various altitudes AGL. FEIS Section 4.2 provides noise effects based upon aircraft altitude AGL. This means that an aircraft flying at 10,000 feet MSL above 3,000-feet MSL terrain would have a noise effect comparable flying at 7,000 feet AGL.
NO-9	There are several different units used to describe noise. Want to see single event sound exposure levels. How do decibels relate to psf? How can we understand the meaning of the sound measurements?	DEIS Section 3.2 explained that different noise measures are used to reflect different noise effects. FEIS Appendix I explains noise measures in more detail and Table I-1 provides typical noise levels for common sounds. Both average noise and single event sound exposure level noise are included in FEIS Section 4.2 to provide a complete picture to decision-makers and the public.
NO-10	Do not want flights over homes or corrals also suggest avoidance areas similar to those given to Native American sacred grounds to include round-up areas, birthing areas, watering holes, etc. Not all the sensitive noise areas have been identified and want assurance all avoidance areas will be respected.	FEIS Section 2.3 explains that the Air Force will work with individuals, tribal governments, and organizations to identify sensitive noise areas and periods of avoidance.
NO-11	Concern for the noise effects associated with Post Traumatic Stress Disorder and other health issues.	FEIS Section 4.2 describes studies conducted regarding performance effects of noise and other noise-related issues.
NP = National Environmental Policy Act		
NP-1	Questions if citizens can vote down the proposal or sue the Air Force. Concern the Air Force can do this without the consent of citizens and is an infringement on citizens' rights. Suggests the Air Force is ignoring the concerns expressed by citizens.	Section 1.5 explains that the FAA has jurisdiction over navigable airspace. FEIS Section 2.10 explains that federal environmental and airspace regulations will be followed in the decision-making process.
NP-2	Concern that comments and objections are not being listened to and that elected officials are not representing citizen concerns. Hope that recommendations will be added in the Final EIS.	FEIS Section 2.10 explains that federal environmental and airspace regulations will be followed in the decision-making process. Section 2.10 also explains the opportunities for public concerns to be incorporated into the decision-making process.

Comment and Response Matrix

Code	*Description*	*Response*
NP-3	Appreciation for the holding public hearings and providing a venue to provide comments and learn more about the proposal.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal.
NP-4	What is the role of the cooperating agency and do they work in our best interest? Suggests that a state law that gives Montana the role of cooperating agency and that the Air Force should coordinate with the state. Statement that as the cooperating agency and final authority, the FAA has the most influence in the decision.	FEIS Section 1.6 of the FEIS explains that FAA is the cooperating agency and will make decisions regarding establishing airspace.
NP-5	How long is the comment period for the Draft EIS? Does the FAA see our comments?	Section 2.12.2 of the FEIS describes the DEIS public comment process and Section 2.12.3 of the FEIS describes the environmental process. The initial comment period opened on August 20, 2010 and was scheduled to end on November 15, 2010, but by request, the comment period was reopened and extended to January 31, 2011, nine weeks beyond the original timeline. Closure of the comment period for the DEIS was described in the public announcements. (See Appendix E.) FAA reviews the FEIS and determines whether to adopt it. Section 1.6 of the FEIS (Section 1.5 of the DEIS) explains that FAA is a cooperating agency and will make decisions regarding establishment of any airspace.
NP-6	Can the Air Force and the FAA cooperating agency provide a commitment that will not limit wind energy projects?	FEIS Section 4.9.3.1.4 discusses towers and FAA requirements for tall structures.
NP-7	If this goes through, can we ensure compliance with the project ROD? Concern the Air Force won't abide by their own rules.	The FEIS and ROD will be legally binding. Any and all mitigations contained in the ROD will become the legal obligation of the Air Force. (See Section 2.10.)
NP-8	How were the meetings advertised? How was the public made aware of the proposal? Concern the meetings were not publicized widely enough or early enough to allow people to attend.	Section 2.12.2 of the FEIS describes the DEIS public comment process and the methods used to advertise meetings. In addition, Appendix E of the FEIS describes the advertising for the 19 public hearings and four Native American meetings held during the public comment period.
NP-9	The language in the document seems vague, such as "expected to", "may be", "approximate", as well as using different units of measure.	DEIS and FEIS language reflects the predictive nature of the analysis conducted to identify potential effects of the action on future conditions. Measurement units in the DEIS and FEIS are similar to those used in other NEPA documents and when possible are consistent throughout the document, but are tied to the type of measurement being made. For example, measurements involving airspace use nautical miles, and measurements of ground areas are reported in acres or square miles. (See also response to NO-9.)

Comment and Response Matrix

Code	*Description*	*Response*
NP-10	What is the process of government consultation? Would like to see other agencies/entities/citizens involved in the comment process and what their comments are. Will a Memorandum of Understanding be created amongst all agencies possibly impacted?	FEIS Section 2.10 explains the NEPA process. DEIS Section 3.7 explained the Government-to-Government consultation. FEIS Appendix E explains other agencies and entities which have been invited to participate in the NEPA process. Appendix E also identifies the public hearing locations and times to support participation by any and all involved parties.
NP-11	This proposal does not follow Air Force Policy Directive 32-70 or EO 11991 in protecting or enhancing the environment. Concern the EIS is swayed towards the needs of the Air Force not for the concern of the environment.	FEIS Section 2.10 identifies the policies and directives followed in the preparation of this EIS. Section 2.11 identifies one of the goals to be reduced environmental conflicts. Section 2.3 provides a list of mitigations.
PN = Purpose and Need		
PN-1	Aircrews need to be combat ready and additional airspace is needed.	The Air Force appreciates your participation in the public involvement effort for the Powder River Training Complex proposal.
PN-2	Why can't you train somewhere else such as Nevada, Utah, the Hays MOA, in deserts, or over water? Why do you need the entire area? Suggests keeping flights in South Dakota and North Dakota. Other planes who want to use the airspace will have to use fuel to get here. Concern there is already enough disruption from military flights and substantial restricted areas already in place. The existing airspace is large enough.	FEIS Section 2.10 describes the training requirements and limitations for B-1 and B-52 aircraft. Section 2.11 explains how the training location alternatives have been identified. Section 2.11 explains that training in other locations is done to the extent possible. Other aircraft are included in LFE training (See Section 2.8). Section 1.0 of the FEIS discusses the purpose and need of the Proposed Action, including the training requirements for the Air Force.
PN-3	Concern that this expansion is not necessary for national security. Suggestion that training be concentrated on ground training rather than aircraft. The Air Force needs to consider how to use America's resources wisely and the potential harm outweighs the benefits. What airspace will be given up?	FEIS Section 1.0 describes the need for a trained military force. Section 2.10 describes the B-1 and B-52 missions for which aircrews need to be trained. Section 2.11 details the training requirements and limitations of existing training airspace. Section 2.11 explains how the training location alternatives were identified. All airspace is reviewed on an annual basis by the FAA and the Air Force to determine its ongoing need and capabilities to meet the training airspace needs. This review process is separate from NEPA.

Comment and Response Matrix

Code	*Description*	*Response*
PN-4	Why is it necessary to fly down to 500 feet (including Native American reservations)? Can they fly at 1,000 feet minimum?	FEIS Section 2.10 describes the low-altitude training associated with the B-1 aircraft. B-1 crews must maintain proficiency in low level employment down to 500 feet AGL to fulfill current and future combat requirements. According to FEIS Section 2.8, approximately 15-20 minutes of a two hour mission would take place below 2,000 feet AGL. The vast majority of this training is currently accomplished at 1,000 feet ATL with a minimum amount of time spent at 500 feet AGL to maintain aircrew proficiency in the unique dynamics of flight at 500 feet AGL. The Standing Rock, Cheyenne River, and Northern Cheyenne Reservations would not be overflown below 12,000 feet MSL under Modified Alternatives A or C.
PN-5	How many days do you need to train in the airspace? Information in the Draft EIS seems contradictory as to whether LFEs would be 10 days or 12 days per year. Thought the airspace would be used for 10 days but Draft EIS says over 200 days.	FEIS Section 2.5 describes the training requirements and presents the proposed scheduled time for the airspaces to be activated for training. Day to day training would be for 240 days per year. LFE training would be up to 10 days per year (of the 240 days).
PN-6	The Bombers have been around a long time. Won't they be replaced soon?	DEIS Section 1.2 explains that the B-1 aircraft continue to be upgraded with multiple advanced technologies to ensure their usefulness and applicability into the future.
PN-7	Suggestion that with today's technology, flight simulators can provide additional training. Existing airspace would be adequate with use of flight simulators. Flight simulators need further discussion.	As explained in FEIS Section 2.11.3.3, sophisticated flight simulators will continue to be used to the extent possible. Even the best simulators lack realism of actual flying and aircrews do not receive the same physical training challenge in simulators as during aircraft flight. Extensive aircrew use of simulators is already included in the flight requirements for the proposed PRTC.
PR = Physical Resources		
PR-1	Would like to see more water and soil data. Water and soil information is inaccurate. pH in MT area is high to very high in Alkaline.	DEIS Section 3.5 mapped soil types and described pH. Almost all (99 percent) of the regional soils have a pH greater than 5.0 (extremely acidic) or less than 8.5 (strongly alkaline). There is no proposed surface construction (See FEIS Section 2.8.6). FEIS Section 4.5 explains that the only feasible soils or water consequences could be from minute particles of chaff. Chaff concentrations are calculated to be approximately 0.00377 ounces per acre per year. (See FEIS Section 2.4.6.3.) The soil pH is nearly entirely outside the range to react with chaff coatings, and the chaff particles rapidly become indistinguishable from silica and aluminum soil elements. No soils or water impacts would be anticipated. (See also FEIS Appendices C and D.)

Comment and Response Matrix

Code	Description	Response
SA = Safety		
SA-1	Concern for mid-air collisions when flying at low levels. What are the safety statistics in the area? What safety measures will prevent mishaps?	FEIS Section 4.3 describes the flight safety of the B-1 and B-52 aircraft, including the Class A accident statistics. These include all aircraft operations, including training below 2,000 feet AGL. The Air Force and FAA would continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may include practices for use of existing data, equipment, and procedures as well as integration of advancements in software and/or equipment.
SA-2	Safety concerns in flying between Billings and Rapid City.	DEIS Section 3.1 explained that Victor airway V86 can be used between Billings and Rapid City, which would be outside the proposed MOA airspace and beneath existing and proposed ATCAAs. IFR or VFR aircraft could use this airway. VFR aircraft could fly see-and-avoid through an active MOA direct between Billings and Rapid City.
SA-3	Safety concerns when rerouting during inclement weather or multiple flights on Victor airways without adequate communication.	DEIS Section 3.1 described Victor airway use during inclement weather flying IFR if MOA airspaces are activated. The stacked and additional MOAs are designed to provide for IFR access and training aircraft temporary relocation out of a specific airspace to allow for IFR transit. FEIS Section 2.3.1 explains that the announcement by NOTAM in advance of MOA activation provides as current information as possible. Pilots who could not fly VFR due to weather or contract requirements, sought to obtain real-time information on a MOA activation, and were not able to obtain such information see the lack of information as an adverse impact.
SA-4	Would like better communication with Denver Center, MNP, and SLC to increase safety. Will ARTCC communication boundaries be simplified?	The communication capabilities within the PRTC region are consistent with established requirements for the National Airspace System. Frequency coverage for aircraft operators will continue as currently established. The existing airspace management procedures used by Denver and Salt Lake Air Route Traffic Control Centers (ARTCC) for controlling PR A/B MOA will be revised and expanded to include Minneapolis ARTCC. Any additional coordination requirements necessary for the management of the PRTC will be added to agreements between the air traffic control facilities and the Air Force. The existing procedures within the Aeronautical Information Manual (AIM) covering contact with air traffic control facilities and details published on charts and other Flight Information Publications (FLIP) should be followed to contact the air traffic control agency responsible for any particular MOA.

Comment and Response Matrix

Code	Description	Response
SA-5	Concern about fires caused by flares and the need to restrict use of flares. Not enough analysis has been done. Extreme fire danger rating is too high; should be lower rating. Need to consider suppression capabilities in regional areas. Please provide an historical comparison. Would like flares dispersed no lower than 10,000 feet.	FEIS Section 2.3.1 describes altitude limitations of flare use and the cessation of use under certain fire danger ratings. FEIS Sections 3.3 and 4.3.3.1.3 describe the different types of flare failures and the potential impacts from flares deployed in fire danger conditions, including the National Fire Danger Rating System and the conditions under which Ellsworth AFB would suspend flare use. Ellsworth AFB mutual aid agreements are also described in that FEIS section. Regional response, including federal agencies, would occur for any fire, including an unlikely flare-caused fire. (See also FEIS Appendix D.)
SA-6	A more thorough discussion on how fires from flares will be handled needs to be addressed.	The FEIS extensively and adequately discusses the potential for fires from any source and how such fires would be handled. FEIS Section 2.3.1 describes altitude limitations of flare use. FEIS Sections 3.3.3.3 and 4.3.3.1.3 describe the different types of flare failures and the potential impacts from flares deployed in fire danger conditions. Section 3.3 explains that fire danger ratings are relative, not absolute, and are location-specific, and that land management agencies estimate fire danger for a given rating area. FEIS Section 4.3.3.1.3 also describes Ellsworth AFB mutual aid agreements with local and regional emergency response agencies, which are activated for any fire, including an unlikely flare-caused fire (See also FEIS Appendix D.)
SA-7	Concern for private pilot's safety when they are flying in slow planes with much faster aircraft in the area, including impact from wind vortices. Similar concerns for high-performance GA flying into 3 NM circle airports and/or flying in thunderstorm conditions.	Training B-1 aircraft would use see-and-avoid as well as electronic capabilities to identify general aviation aircraft approaching the B-1's path of flight. FEIS Section 4.1 explains that see-and-avoid procedures are the responsibility of all pilots, including military pilots. Section 4.9 explains that uncertainty regarding low-level overflight and wake vortices could have the potential to affect low-flying aircraft, including highline patrol, pipeline patrol, and crop dusting aircraft. Section 4.3 describes the potential safety risks associated with military training aircraft and impacts from lack of communication. This safety risk is seen as an adverse impact. Section 4.3 describes training aircraft accident rates and safety concerns where worsening weather would require a VFR flight to go IFR but a scheduled MOA would prevent IFR flight. The stacked and additional MOAs are designed to provide for IFR access and training aircraft temporary relocation out of a specific airspace to allow for IFR transit. GA uncertainty about flying into scheduled training airspace is further addressed in AM-1. The random and unpredictable B-1 overflight which could occur at any given location an average of six to nine times per year or more at or below 2,000 feet AGL was seen by pilots at hearings as an adverse impact. (See

Comment and Response Matrix

Code	Description	Response
		Section 4.9). The Air Force and FAA would continue coordination to enhance the situational awareness of aircraft operators as to whether PRTC low altitudes MOAs (airspace below 12,000 feet MSL) are active. This may include practices for use of existing data, equipment, and procedures as well as integration of advancements in software and/or equipment.
SA-8	Concern for pilot's safety while doing frequent wildlife surveys.	DEIS Section 3.1 described the wildlife and wetlands surveys and photography and identifies specific weather conditions and time periods when such surveys would need to occur. Section 4.9 explains the need to coordinate with Ellsworth AFB to deconflict military operations.
SA-9	Concern for safety during recreation and ranching.	FEIS Section 4.8.3 explains land use and recreation impacts and describes startle effects upon domestic and ranch animals. Recreation, including parasailing could occur at specific locations. Often these locations are identified on FAA aeronautical charts. Section 4.8 explains that the Air Force would not normally schedule the airspace from Friday noon through Sunday night to support heavy use recreational activities. Recreation can also include camps for youths and adults. The Air Force will work with ranchers and others to identify seasonal avoidance areas. (See Section 2.3.) Section 5.0 discusses recreational cumulative effects.
SA-10	Aircraft and bird strike safety concern.	FEIS Section 4.3 explains bird-aircraft strike risk and actions taken to reduce risks.
SA-11	Concern for safety if training includes flying lights out.	Training would not be with lights out in the proposed PRTC MOA airspace.
SA-12	Concern for the danger of flares on wells and gas pipelines.	FEIS Section 2.8.5, Section 4.3.3.1.3, and Appendix D explain flare release altitude limitations of 2,000 feet AGL. Flares burn out in 500 feet or at 1,500 feet AGL. It would be extremely unlikely that a burning flare would strike the ground at all (see Section 4.3.3.1.3) and even more unlikely that a still-burning flare could fall at any specific location, such as a well.
SA-13	Can chaff and flare use be limited to winter months to avoid peak fire season?	PRTC training requirements are necessary during summer months, but the Air Force would discontinue flare use when the fire rating is very high or extreme. FEIS Section 2.8 describes chaff and flare use, including flare release restrictions. Chaff does not burn and does not pose any fire risk.

Comment and Response Matrix

Code	Description	Response
SA-14	Concern of the health risks of ingesting the chaff and flare debris or from dud flares.	FEIS Section 2.8 and Section 4.3.3 describes the chaff and flare residual materials. Proposed chaff deployment would result in an estimated average of 0.00377 ounces of what is effectively soil per acre per year. Chaff and flare plastic or paper pieces have never been recorded as ingested by animals (see FEIS Appendices C and D). Appendix C explains that airborne chaff does not abrade to respirable particles. During controlled tests, animals rejected eating concentrations of chaff. Chaff fibers are dispersed in the air and upon contact with the ground, break down to become silica and aluminum particles indistinguishable from the composition of soil. The animal fat micro-coating of chaff fibers breaks down when exposed to sunlight. (See Section 4.5.) Section 2.8 describes the extremely low risk of any dud flares (one per three years in the entire airspace).
SA-15	Concern for safety during cloud-seeding operations or agricultural applications.	FEIS Section 4.1 explains that military training pilots would be briefed where weather modification activity is planned. Information on this weather modification activity would need to be coordinated with the Air Force and the industry. Air Force would use see-and-avoid procedures to work with weather modification activities. (See also responses to SO-2 and SO-28.)
SA-16	Concern with use of countermeasures interfering with radar. How will the 60 NM chaff deployment restriction be applied?	Aircrew pre-flight briefings (see FEIS Section 2.10.4.4) identify avoidance areas and distances for deployment of defensive countermeasures. FEIS Sections 2.3 and 2.8.5.1 describe the chaff deployment restriction relative to FAA radars. Weather radars have the ability or identify and distinguish chaff. FEIS Section 4.3.3.1.2 discusses the deployment of chaff after receiving clearance from FAA Frequency Management Authority.
SA-17	Concern pilots are showing off and flying recklessly.	FEIS Section 2.10 describes the detailed activities required for pilot training and briefings in advance of missions. Pilots are training as they are expected to perform in combat and are not flying recklessly or showing off.
SA-18	Most medical flights are above 10,000 feet and may be operating at FL180 to FL250.	FEIS Section 2.3 explains that medical flights would be given priority. Section 4.1 recognizes that medical flights typically are above 10,000 feet MSL. The MOA stratification is designed to permit IFR transit, including emergency flights.

Comment and Response Matrix

Code	*Description*	*Response*
SA-19	Concern there isn't adequate communication capabilities when medical or other emergency flights are needed. How will they be given priority?	FEIS Section 2.3 explains that medical flights would continue to be given priority, as they are expedited currently in the existing Powder River MOAs. FEIS Section 4.1.3.1.4 notes that the Air Force currently immediately shift aircraft or end training in the airspace to accommodate emergencies. Also Section 2.3 identifies that MOA segments are designed to permit IFR transit, including for emergency flights. The stacked and additional MOAs are designed to provide for IFR access and would allow training aircraft temporary relocation out of a specific airspace to allow for IFR transit. FEIS Section 4.1.3.1.4 describes the lack of radio coverage and communication within the airspace. Section 2.5 describes the scheduling of the airspace.
SA-20	What are the response measures if an aircraft crashes?	DEIS Section 3.3 described the response measures if an aircraft crashes.
SA-21	Concern pipelines won't be checked frequently enough for leaks due to inability to access the airspace.	FEIS Section 2.5 presents the proposed schedule for training airspace activation. Pipeline checks could always be performed below 500 feet AGL or when training airspace was not scheduled. As with any temporary avoidance area, when informed of an activity, the Air Force would work with the entity to avoid the area and/or altitude.
SA-22	Concern for increased heart and other health problems for those who live under a flight path.	There is no particular flight path for aircraft training within the airspace. DEIS Section 3.2 described the random nature of flight training activity throughout the airspace. FEIS Section 4.9 describes the calculated six to nine annual average number of overflights for any given location within the airspace, although specific locations could be overflown more or less frequently. Individuals overflown may be annoyed, but there would be no flight paths with individuals regularly overflown.
SA-23	Concern for the sonic boom's effect on pipelines.	FEIS Section 4.2 describes the overpressure from sonic booms. All pipelines are constructed to withstand substantially greater pressures than could possibly be generated by a sonic boom.
SA-24	Concern of increased risk and inability to avoid towers when training or overflight damage to wind machines.	DEIS Section 3.3 explained that towers are mapped and lighted. Training aircraft identify and avoid all towers during flight operations. Permanent avoidance areas are established for towers. No damage to tall structures or wind machine operations would occur (see Section 3.3.3.3).

Comment and Response Matrix

Code	Description	Response
SA-25	Concern the additional time pilots will be in the air trying to get around an active MOA will increase safety risks.	Pilots can transit an active MOA using see-and-avoid or receive IFR priority to arrive or depart an airport under an active MOA. FEIS Section 4.3 explains that general aviation unable or unwilling to transit an active MOA using see-and-avoid, unable to communicate for IFR flights, and unwilling to exercise ground hold or reschedule during the time the MOA would not be active could potentially expend up to 4 hours of additional travel time either in ground delay and/or re-routing around an active MOA. If a pilot chose to re-route and fly the additional time, there would be no quantifiable safety effect associated with a non-quantifiable estimate of whether or not a pilot would elect to re-route, ground hold, fly IFR, or fly see-and-avoid. FEIS Section 4.1 also explains that communication capabilities would be available prior to training in a low MOA. VFR pilots unwilling to fly see-and-avoid, ground hold, or reschedule could see any additional flight time as an adverse impact.
SA-26	Concern chaff and flare use will create airborne FOD hazards.	There has not been a recorded instance of chaff or flare plastic or paper residual materials damaging an aircraft, even in extensive use training ranges such as Nevada Test and Training Range or Utah Test and Training Range. Chaff fibers, thinner than a human hair, rapidly disperse in the air. Plastic and paper pieces (described in FEIS Appendices C and D) fall to the ground as described in FEIS Section 2.8.
SA-27	Concern for the impacts from Chaff and Flare use on the environment, air quality, and people below. Concern that additional study needs to be done to determine the effects of chaff on animals and humans. Will the Air Force provide chaff and flare education to fire investigators?	FEIS Section 2.8 describes the lifecycle of chaff and flares. Section 4.8 describes the chaff and flare impacts, including residual materials which fall to the ground. FEIS Section 4.6 describes the extent of distribution of such residual materials. FEIS Appendix C explains that long-term studies to identify chaff have demonstrated that chaff breaks down quickly to particles of aluminum and silica, which are the most common elements in the soil. The degraded chaff particles are effectively indistinguishable from existing soil particles. FEIS Appendix D provides expanded details on flare type, usage, and impacts. As described in Section 2.8 and Section 4.3 of the FEIS, the Air Force will work with local fire departments under the proposed airspace to educate them on chaff and flare deployments and residual materials.

Comment and Response Matrix

Code	Description	Response
SA-28	The analysis assumes chaff will be distributed evenly throughout the airspace, is this fact or will it be concentrated within routine training routes? Can the amount of chaff deployed be quantified?	FEIS EIS Section 2.8.5 describes the quantity of chaff deployed and chaff distribution. Chaff is not limited to any specific area. It is used in response to air- and/or ground-based threats. Winds at deployment altitude would disperse chaff fibers which are thinner and lighter than human hair. Aircraft training flights and chaff distribution would be random and not localized.
SO = Socioeconomics		
SO-1	This will decrease home/ranch values. If the military is going to take our land, we should be compensated for it.	As described in FEIS Section 4.9, the presence or absence of training airspace over existing ranches and farms is not considered in land appraisal value within the ROI. (See also SO-19.)
SO-2	Spraying crops will be limited or impacted by low-altitude training overflights or wake vortices which will have an economic impact on our crops. Would like mitigations during crop spraying months.	FEIS Sections 4.3.3 and 4.9 explains the safety elements associated with wake vortices and crop-spraying aircraft. Section 4.9 describes the average overflight of any given area. Potential safety risk to agricultural application aircraft is an unavoidable adverse impact. Economic concerns related to agricultural uses are addressed in FEIS Section 4.9.3.1.2; impacts to crop-dusting etc., are discussed in Section 4.8, Land Use.
SO-3	Concern the tax base will go down when property tax goes down impacting the regional area.	As described in FEIS Section 4.9, the presence or absence of training airspace over existing ranches and farms is not considered in land appraisal value within the ROI.
SO-4	The quiet and serene environment is part of the value of the land.	FEIS Section 4.2 explains noise consequences. FEIS Section 4.9 describes the estimated average number of times per year a location could experience low-level overflight. Section 4.1 explains that individuals under the existing Powder River A and B MOAs (proposed PR-2) have been startled by low-altitude training aircraft. During hearings, individuals expressed the concern that even infrequent low-altitude overflights, and the uncertainty of such overflights, would have an adverse impact; that impact would be unavoidable.
SO-5	Concern for the economic impact to the areas that become off limits to pilots, including medical teams.	No areas under the proposed MOAs would become off-limits to civilian pilots. FEIS Section 4.9 explains that emergency flights will be given priority. Different MOA segments facilitate IFR flights through activating or deactivating different MOAs (See Section 4.1.) Section 2.5.1 explains the schedule for flight training. If a MOA or ATCAA were scheduled, civilian aircraft seeking to fly IFR in the airspace or change from VFR to IFR due to weather would contact ATC and the Air Force training aircraft would temporarily use a different MOA. To support IFR flights. Economic concerns about flying VFR through active MOAs are addressed in Section 4.9.3.1.2.

Comment and Response Matrix

Code	Description	Response
SO-6	Concern for the economic impact to businesses, such as during LFEs, due to people not able to or want to fly to the area.	The Air Force and FAA would continue coordination to develop procedures to handle nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected airspace to the NAS. The Air Force does not propose to schedule PRTC during weekends or holidays, which are high GA use. Increased civil aircraft flights at times, such as the beginning of hunting season, would function as described for IFR and VFR flights (see Section 4.1.3.1 for review of IFR and VFR civil flights). Section 2.5 describes the LFE activity and hours when LFE operations would occur. As described in Section 4.1, civil aviation could schedule around the quarterly LFEs conducted 1 to 3 days a quarter, for not more than 10 days per year. During an LFE there could be a period of 2 to 4 hours per day of training. This would not be expected to have a significant impact upon businesses in the area. Hunting and other forms of recreation coexist with military training under the existing Powder River MOAs. Normal flights could occur during LFE days when the airspace was not active. AM-1 addresses the overall need for communication and coordination. For noise effects on hunting see Section 4.9.2. Effects to reservations are discussed in the Cultural (Section 4.7) and Environmental Justice (Section 4.10) sections.
SO-7	This will increase fuel consumption, increasing costs to private pilots and commercial airlines when they have to fly around the active MOAs. GPS and NexGen radar make Victor airways obsolete.	Civil aircraft flights above FL260 would not be affected by the proposed PRTC. FEIS Section 4.1 explains that there could be increased fuel consumption for civil aviation if a pilot did not schedule around the times of the NOTAM-announced activated airspace, chose not to fly see-and-avoid, could not fly in an inactive MOA segment, or decided to fly IFR around an active MOA. If a pilot chose not to do any of the above actions, an up-to-4-hour delay or re-routing could be seen by civil aviation pilots as an adverse impact (see also response to SO-6 and SO-9). When training airspace was not activated, a pilot's use of GPS for direct VFR flights would not be affected.
SO-8	This will cause long delays which will increase costs to civil aviation.	FEIS Section 4.9 explains the extent of delay which could be anticipated if GA elected to not fly see-and-avoid during the time period when a MOA was scheduled, were unable to fly IFR, or were unwilling to fly IFR under ATC direction, Table 3.1-7 presents the estimated daily civil operations within the airspace during proposed scheduled training hours. Delays of 2 to 4 hours for those who elected not to fly VFR see-and-avoid and could not fly IFR could be seen as an adverse impact.

Comment and Response Matrix

Code	Description	Response
SO-9	Concern tourism, including hunting and recreation, will decrease when MOAs are in use.	FEIS Section 4.8 explains that hunting and recreation regularly occur under the existing Powder River A and B MOAs (proposed PR-2). MOA activation is not expected to impact tourism, hunting, or recreation, as described in Section 4.8. The mitigations described in FEIS Section 2.3.1 explain avoidance elements of the Little Bighorn Battlefield National Monument. The frequency of low level overflight (2,000 feet AGL or below) is estimated to average 6 to 9 times per year at any given location. In the unlikely event that a hunter or game was startled, the EIS notes that the hunter would likely be annoyed. (See FEIS Section 4.8.) FEIS Section 4.9 describes the potential GA flight delays which could occur as a result of GA pilot decisions when a MOA was scheduled. Air Force training operations would be temporarily adjusted to allow IFR arrival and departures to/from airports beneath PRTC (see FEIS Section 4.1).
SO-10	Concern for the economic impact on regional airports, including future development of airports/airstrips.	FEIS Section 2.3.1 describes military training exclusion areas for public airports under the proposed airspace, which generally are a three-nautical mile circle with an altitude of 1500 feet. FEIS Section 4.3 explains that public airports and private airfields dependent on transient air traffic could be impacted. As a consequence, if an individual chooses not to, or is unable to, fly when the MOA is active, local airport users could experience delays of up to 4 hours. Pilots unable to fly IFR and unable or unwilling to fly VFR in an active MOA could experience an up-to-4-hour delay (see FEIS Section 4.1.3.1.3). The Air Force and FAA would continue coordination to develop procedures to handle those nonparticipants (i.e., aircraft not participating in MOA training) operating IFR entirely within the PRTC while simultaneously supporting the expeditious completion of the training flight and the return of the affected airspace to the NAS.
SO-11	Concern for the economic impact this will create on ranchers checking on their animals by plane.	FEIS Section 4.9 describes the average extent of overflight, and Section 2.10 describes the average time when military aircraft would be at altitudes 2,000 feet or below. FEIS Section 2.3 explains that the Air Force would provide for reasonable temporary avoidance when provided information of a ranching activity such as weaning and branding. Ranchers could access NOTAMs to determine when an airspace was active. Individuals who chose not to fly see-and-avoid during the period of a low-level scheduled MOA and could not delay or reschedule their flights to check on animals during the time when the MOA would not be scheduled, see the additional limitation as an adverse impact; that impact is unavoidable.

Comment and Response Matrix

Code	*Description*	*Response*
SO-12	Who do we contact for damage claims? Will claims be handled locally? Ellsworth AFB does not respond to calls.	FEIS Section 4.3 explains that, for example, penned range cattle could be spooked by sudden noise or low-level overflight. FEIS Section 2.12 explains that the Air Force will work with ranchers to establish reasonable avoidance areas. The section also includes the damage claims process which begins by contacting Ellsworth AFB Public Affairs. (See also GE-8.)
SO-13	Concern for the economic impact of animals getting spooked and hurting themselves or others, taking out a fence, reduced fertility, etc. How will we be compensated? Would like mitigation measures in place to avoid round up, birthing areas, finishing enterprises, etc.	FEIS Section 4.3 describes the potential impact to animals and explains that the Air Force will work with ranchers under a variety of circumstances, particularly when provided timely notification, to identify sensitive times and locations to avoid scheduling low-altitude overflight during those times. (See also BI-2.) FEIS Section 4.9 describes the average number of low-level overflight at any given location under the airspace. Low-level overflight is seen as an unavoidable adverse impact without mitigations. FEIS Section 2.12 describes how damage claims would be handled. Mitigations described in FEIS Section 2.3.1 include: "Temporary avoidance areas would be coordinated with ranches to reduce the potential for impact during concentration of range animals for branding, calving, weaning, and/or other ranch operation."
SO-14	This project is too costly. Who pays for it? How is it a fuel savings for the Air Force if transient aircraft train in the airspace from other bases?	As explained in FEIS Section 2.10, the PRTC airspace provides for substantially improved training with available fuel resources.
SO-15	Concern for the economic impact from the inability to perform predator control.	FEIS Section 4.9 describes the average extent of overflight, and Section 2.5 describes the average time when military aircraft would be at altitudes 2,000 feet or below. FEIS Section 2.3 explains that the Air Force coordinate with ranches to identify temporary avoidance areas to reduce the potential for impact during concentration of range animals for branding, calving, weaning, and/or other ranch operation. Ranchers could access NOTAMs to determine when an airspace was active. Individuals who chose not to fly see-and-avoid during the period of a low-level scheduled MOA and could not delay or reschedule their flights during a time when the MOA would not be scheduled, may see the additional limitation as an adverse impact.

Comment and Response Matrix

Code	Description	Response
SO-16	Concern for the economic impact on wool value from chaff or chaff and flare materials.	FEIS Section 2.8 and Appendix C explain that chaff fibers rapidly break down and become the equivalent of soil. Wool processing procedures include methods for cleaning the wool for soil, burrs, or other materials. Chaff particles are indistinguishable from soil, so, in the unlikely event that a chaff particle alighted on a sheep, such particles would be removed along with other materials in the wool cleaning. There is no basis for believing that chaff or flare inert plastic or paper pieces would become attached to sheep or to any other animal. (See FEIS Appendices C and D for relative sizes of the plastic pieces.) The normal procedures for cleaning the wool would clean out any extremely unlikely pieces of chaff or flare residual materials.
SO-17	Concern for the impact of future wind farms, oil and gas development, or communications towers.	FEIS Section 4.9 explains that the Air Force would not oppose the development of wind farms which would not impact military readiness or training. Future wind farms approved by FAA would be mapped for flight avoidance. FEIS Section 4.8 explains that the proposed action would not inhibit wind farm development under the airspace. Sections 4.9 and 5.0 explain that no impacts to oil and gas development or other surface development would occur from aircraft overflights. Section 2.3 explains that an adopted mitigation would be the avoidance of known blasting operations (see Sections 4.9 and 5.0). Communications towers are designed to withstand wind forces substantially in excess of aircraft wake vortices. Towers are mapped and avoided. (See Section 3.3.) The proposed action does not include any Air Force construction projects under the airspace.
SO-18	Concern that low-level or supersonic flights will damage houses or household items or disrupt lives and sleep.	FEIS Section 4.8 explains that vibration from infrequent sonic booms or an average of 6 to 9 low-level flights per year could vibrate bric-a-brac. Section 2.12 describes the Air Force procedure for damage claims. Sudden overflight or sonic booms during LFEs 1 to 3 days once a quarter for up to 10 days per year could be seen as an adverse impact.
SO-19	More analysis needs to be done on impacts on property values. The document only uses appraisers in Montana.	FEIS Section 4.9 explains that MT, ND, SD, and WY state laws were reviewed to determine the appraisal process for property valuation, and appraisers were interviewed in MT. There are no property appraisal procedures or laws that would affect appraisal processes in any location under the proposed MOA (see Section 4.9.3.1.1). MT was used in the example because much of the existing Powder River A and B MOAs overlie MT.

Comment and Response Matrix

Code	Description	Response
SO-20	Feedlots/CAFOs have not been adequately identified or considered in economic impacts.	FEIS Section 2.3.1 explains that the Air Force will work with ranchers and farmers to identify noise-sensitive locations and establish reasonable avoidance areas around those locations when they are in use.
SO-21	EIS should explain how landowners and residents have been affected by past training.	FEIS Section 4.8 explains that B-1 training has occurred in Powder River A and B MOAs (proposed PR-2) for decades. Section 4.9 explains that ranch and farm activities as well as recreational activities, including hunting, all occur under the existing MOAs. Impacts have been avoided when seasonal avoidance areas were identified, for example, by ranchers. There is no quantifiable difference among the economic activities under the existing airspace or the proposed airspace, except that the percentages of ranching and agricultural land uses are somewhat different, and there are no designated urban or tribal areas under the existing airspace. Altitudes and avoidance areas proposed in the Modified Alternatives are designed to reduce effects on these areas. FEIS Section 5.0 describes past, present, and foreseeable actions and discusses cumulative effects.
SO-22	The EIS does not adequately or accurately discuss regional or national economic impacts.	FEIS Section 4.8 explains that B-1 training has occurred in Powder River A and B MOAs (proposed PR-2) for decades. Section 4.9 explains that ranch and farm activities as well as recreational activities all occur under the MOAs. Public airports and private airfields, as well as energy development, are located under the existing training airspace. There is no substantial difference between the ranching and agricultural land uses under the existing airspace and under the proposed airspace, with the exception that the percentages of ranching and agricultural land uses differ somewhat. (See Section 3.8). The differences between the existing airspace and the proposed airspace are that there are no designated urban or tribal areas under the existing airspace. FEIS Section 4.1.3.1.3 explains that since the vast majority of the commercial jet route traffic is above FL260 and could have been significantly impacted by the higher altitude ATCAA flight training activities, proposed ATCAAs above FL260 were removed from the PRTC proposal.

Comment and Response Matrix

Code	*Description*	*Response*
SO-23	Would like property values of homes in metropolitan areas near airports compared to those outside of flight path.	There are no areas under existing or proposed MOAs where noise levels approach those in metropolitan areas near airports. There are no proposed flight paths over any locations. FEIS Section 4.9 explains the random nature of flight activities within the existing and proposed MOAs. FEIS Section 4.2 explains that there are no areas under the proposed airspace where day-night (DNL) noise levels would approach the noise levels where property values are identified as being affected in metropolitan areas.
SO-24	The economic benefits go to South Dakota and North Dakota but not Montana or Wyoming.	Direct economic benefits from a military installation are primarily experienced by the community or communities nearest the installation. In this case, Ellsworth AFB is located in the northwest part of South Dakota. The existing electronic capabilities are located in South Dakota, Wyoming, and Montana. National defense training requirements, not the distribution of economic benefits, drives the physical configuration and location of the proposed action. FEIS Section 1.0 describes the driving forces behind the purpose and need for the Proposed Action.
SO-25	Concerns about base closure.	The potential for base closure is beyond the scope of this action.
SO-26	Concern that flight instruction schools will be economically impacted.	FEIS Section 4.9 describes how regional airports would be avoided during B-1 flight training by a three-nautical mile by 1,500-feet avoidance area. If the avoidance areas do not permit flight instruction, students would not be expected to fly see-and-avoid in an active MOA. MOA scheduling information and announcement by NOTAM of MOA activation would help with planning for flight instruction. If the mitigations in FEIS Section 2.3.1 were deemed to be inadequate for flight instruction, operators could see the random low altitude flights as an adverse impact.
SO-27	Concern if the Sage Grouse is listed as endangered, thousands of people will be put out of business.	DEIS Section 3.6 explained that the greater sage grouse is currently a candidate species. FEIS Section 4.6 explains that human surface activity has been shown to disturb sage grouse leks. Infrequent random overflights or rare sonic booms during LFEs would not be the type of noise that has been demonstrated to affect sage grouse leks.

Comment and Response Matrix

Code	*Description*	*Response*
SO-28	Concern for the economic impact to cloud seeding operations as well as flight safety for VFR and IFR air operations for private and commercial purposes; affecting weather modification operations (cloud seeding), crop spraying, and fire suppression throughout the region	DEIS Section 3.1 recognized that weather modification flights have to respond rapidly to meteorological conditions. FEIS Section 4.1 explains the mitigation measures for potential impacts to other airspace users. These measures would require increased communication between weather modification entities and the Air Force during scheduled MOA periods. Scheduling of airspace, announcement by NOTAM of activation, and effective communication should reduce impacts to cloud seeding operation, crop spraying, and fire suppression. (See FEIS Sections 4.1, 4.8, and 4.9.)
SO-29	Few problems under airspace. One phone call establishes temporary no-fly zone for ranching operations.	DEIS Section 4.8 explained that aircraft have overflown what is effectively the proposed PR-2 for decades. FEIS Section 2.3.1 explains that the Air Force will continue to work with ranchers to establish avoidance areas.
SO-30	Acreage listed in the agricultural table does not seem accurate.	Values in a Section 3.9 table in the DEIS were misaligned by one row. Table has been corrected in the FEIS.

COMMENTS WHICH THE FEDERAL AVIATION ADMINISTRATION (FAA) RECEIVED DURING THE 2014 CIRCULARIZATION PROCESS

RE: Powder River Training Complex Military Operations Areas, North Dakota, South Dakota, Montana, Wyoming

Mr. Wheeler,

I am an instrument rated private pilot from central North Dakota. I am writing to comment on the proposed Powder River MOA expansion that will have a large impact on the flying community here in the four states involved. The need for a well-trained military is understood and appreciated, but the problems faced by local aircraft are going to be difficult to deal with. The NOTAM system for identifying active times in the training area might not be the easiest or most accurate way to provide up to date information. The coordination the military must use to plan and execute a training scenario could be expanded to include notifications to the flying community during actual training. Perhaps a dedicated frequency could be established to broadcast the status of the MOA training activity. With today's access to mobile data, a web site could be used to post training activity. Let's not move our military training to the next level without also moving the civilian notification methods to the latest in technology.

AM-12

Radar coverage and communication with air traffic control can be essential for proper separation of aircraft. Many areas across the upper Midwest have limited radar coverage for flight below 8000' MSL. Couple this with ATC coverage by three different centers, Salt Lake, Denver, and Minneapolis, a situation could develop in this training area where civilian and military aircraft would not have the best service for safe operation. Enhancements to these systems should be considered for users of this airspace if the MOA is expanded.

AM-3

I have had B-52's flying within ¼ mile of our farm at 300' AGL in the 1960's, and later an IR training route with many B-52's per day traveling just a few miles south of my runway. These were predictable locations; the routes were only a few miles wide. This proposal, with high-speed aircraft able to operate at 500' AGL and above over a large geographic area, presents an unreasonable restriction on local users of the airspace. Please consider raising the floor of the training areas to 8000' feet which would allow somewhat normal operations to continue for flight training, personal travel, medical flights, and charter air service to the affected areas. Route deviations for me to fly around these areas will add considerable cost and time or make air travel into the affected area impossible for many days of the year.

GE-3
SO-7

1

This expansion of the Powder River Military Operations Area is an unreasonable proposal as presented, and I cannot support it as is. Raising the floor of the training area to allow for somewhat normal activities in the affected areas, and enhancements to the communications and radar systems, would be important steps to gain my support. I am a licensed EMT working with our local ambulance service, so I understand the need for good training. We need a well trained military force, let's give them the tools to train with, but not at the cost of losing our ability to conduct business, provide medical flights, or just travel freely in this large portion of the Upper Midwest.

Hi

My name is Jim Davis and I am a fourth generation rancher that helps operate two family owned ranches in northwestern South Dakota. Our two ranches lay within the new purposed expansion area of the Powder River MOA. Please understand my comment isn't to sound non-patriotic or non supportive of our military, but rather shed some light on the negative impact that this expansion is going to have.

I am a pilot and own and operate small aircraft in conjuction with our ranching operation. Being able to operate our aircraft to oversee livestock, conduct animal damage control and provide aid to utility companies after natural disasters is vital to our operation. Most of our tasks are conducted at low levels which puts my life and the lives of many others doing similar activities at an unnecessary risk when these military aircraft are present at these altitudes. The Airforce's environment impact statement manual states that there anti collision tactics are to look and avoid. How can this be done when the B-1 is often flown by itself using a terrain following guidance system when it is conducting low level missions? The only one doing any looking and avoiding is the other aircraft in their way. Even if a midair collision is avoided, the large wake vortices left behind from these large supersonic aircraft create just as lethal of situation as a midair collision itself. These aircraft are very hard to see (by design I am sure) when they are low and below the horizon approaching at over ten miles a minute.

AM-6
SA-1
SA-7
SA-9

Three days out of every quarter the Airforce will conducts LFE's or large force exercises, which puts all types of military aircraft fast and slow and high and low in tight quarters with each other and all other non IFR traffic. Note IFR traffic isn't permitted through these areas when LFE's are being conducted they must be rerouted.

AM-6
AM-20
AM-21
AM-27

The low level high noise maneuvers and increase in traffic not only threaten aircraft but causes chaos in corralled and newborn livestock as well as all types of wildlife. Also the Airforce intends to disperse flares and chaff. This practice is not to be done below 2000 ft AGL but the variation in terrain elevation and mistakes made during tense training moments could result in a real threat for wildfires if these flares were to reach the ground. This could result in extreme property damage and leaving you the land owner the burden to deal with because the Airforce don't intend on putting fire suppression equipment in active areas. Note it is up to the Airforce to determine if drought conditions are extreme enough to stop this practice.

LU-3
BI-4
NO-5
SA-5

Another factor that plays a significant part is the devaluation of personal property. This can be very difficult to put a price on but you can rest assured that land within an active MOA isn't as desirable as comparable property that isn't in a MOA.

In rural areas, prompt medical attention can mean the difference between life and death. Life flights play a critical role when it comes to saving lives. It is unjustifiable for this medical tool to be jeopardized by difficulty in trying to establish a communication bridge with the Airforce before a life flight can be made in to an MOA.

LU-1
SA-25
SA-18
SO-1

13

In conclusion, the economic effect that this is going to have on local airports, rural agriculture, general and commercial aviation, and the medical field within this expansion area is not worth the gain that the Airforce is striving for. The comment period on this very important issue seems as though it is extremely short and should be lengthen to gain valuable input from all it pertains to. Furthermore, what you allow to happen today affects the lives and livelihoods of many others tomorrow. Affecting an airspace from 500 ft AGL to 60,000 ft MSL within a four state area used at the Airforce's discretion and terms just isn't acceptable.

RESOLUTION
2010-14

WHEREAS, The United States Ellsworth Air Force Base is proposing an expansion to its Powder River Training Complex, and

WHEREAS, the citizens of Butte County and the Board of County Commissioners support and understand the importance of the training that takes place at Ellsworth, but there is concern regarding safety if the expansion is approved as proposed, and

WHEREAS, the Commission is concerned about the safety of local pilots that regularly fly within the airspace contemplated by the expansion for ranching and agricultural purposes, and

SA-1

WHEREAS, the Commission is concerned that the 500 foot ceiling contemplated by the US Air Force would disrupt the day to day agricultural operations in Butte County, and

SO-2

WHEREAS, the Commission is concerned about the fire dangers that exist when flares are discharged and chaff fibers are released from US Air Force aircrafts, and

SA-5

WHEREAS, the Commission is concerned about the level of advance notification offered by Ellsworth and whether such notification is effective in warning Butte County residents and local pilots of Air Force planes flying over Butte County.

AM-3

NOW, THEREFORE, BE IT RESOLVED that the Butte County Board of Commissioners express concern about the proposed expansion of the Powder River Training Complex within the boundaries of Butte County, as it is the County's responsibility to protect the safety and livelihood of the citizens of Butte County.

SA-1

Dated this 1st day of June, 2010.

RE: Proposed establishment of Powder River Training Complex

AM-5
AM-6
LU-3
LU-1

To whom it may concern:

Let's get right to the point. Such a grab of proposed airspace will have a detrimental effect upon General Aviation, IFR traffic, ranching and civilians living under the MOAs.

- Several times per week just my company alone launches our aircraft from Casper, Wy to destinations throughout the Bakken oil reserve area, such as: Dickenson, ND, Williston, ND, Watford City, ND , Minot, ND , Sidney, MT, Glendive ,MT, , and Baker, MT. We will be negatively impacted by the inability to fly IFR through the PRTC.
- We will have to plan all trips to circumnavigate the PRTC, adding to expensive aircraft costs and even more expensive departmental costs.
- The cost of having to navigate around the airspace to the northern destinations will cost an additional $1000 to $1500 per trip, per aircraft.
- Although the proposal does not imply restricted airspace, IFR traffic cannot fly inside an active MOA
- We cannot even go over the top of the MOA due to the ATCAA airspace (which is not published).
- What about all the other IFR traffic and companies doing the exact same thing every week from all around the country?
- Pt 135 companies will suffer crippling effects and some local ones based under or nearby the MOA proposal may be forced into shutdown. That is not promoting aviation.

AM-5
AM-6
AM-20
AM-21
SO-7
SO-8

[redacted]

15

- Ranching, livestock and calving will also be touched. Low level jet traffic and sonic boom will bother livestock and lifestyle.
- Increased fire risk due to flare, chaff and potential military aircraft accidents.
- The Training Complex could impact 95 jobs that generate $3.8 million in economic activity. (from the Montana Economic Impact of Airport Study)
- Will the Powder River Training Complex cost us more by having other military units fly there to train vs Ellsworth training elsewhere? I believe so, and a training complex of this size implies that.

RE: AIRSPACE STUDY 14-AGL-06NR
POWDER RIVER PROPOSED TRAINING AREAS

Dear FAA Manager,

We the undersigned Bowman City Commissioners are very concerned about the proposed Powder River Training Area expansion. Our community and city would be directly under proposed area number three. Bowman is building a new airport to accommodate increased larger turbine aircraft, which is necessary due to the Bakken, Three Forks, Tyler, and Williston oil activities. The proposed training area altitudes, navigation, entry and exit points, etc. will have a definite effect on our local aircraft operations. Other major concerns are the use of flares and dispensing of chaff. It doesn't take much to start a large grass fire in our topography. Will chaff have an effect on livestock or wildlife ingestion along with surface water runoff? We feel a compromise can be made to reduce the impact of the training areas. Some recommendations include raising the area floor from 500' above ground to 8,000' MSL, or limit the 500' AGL restriction to 1 or 2 days a week instead of five days a week, or direct telephone link to a military training office for instant updates, for pilots near the areas. Thank you for your attention.

To Whom it may concern, March 27, 2014

First, I want to make it clear, I do support, respect, and understand that our Military do need a place to train. But ~~can't~~ aren't there many area's that are better suited that don't have as many impacts on lively-hoods and wildlife, such as the deserts. GE-9 LU-1 GE-3 SO-5 SO-6

I am against any expansion to our area.

We already have a 9000 sq. mile training area that takes up the whole south eastern part of Montana, North eastern Wyoming and a small fraction of Southwestern South Dakota.

Rather than intrude more into our area if it is such a good idea according to South Dakota's senenator John Thune lets use more of South Dakota. Here again we have someone from someplace else imposing their ways and ideas onto us, and they don't have to live with what gets imposed on us and suffer the consequences. Just like the eastern part of the country putting the wolf back into Yellowstone Park. And guess what?, now we here in southeastern Montana have to suffer the problems that the wolves bring us. And guess what else, those eastern people and law-makers have no worrys. PN-2

We ranch in Powder River County at Broadus, Montana. We already are in the middle of the air traffic that exists now.

17

Our area has been seeing more small aircraft lately, because of the gas and oil industries interests. Our local oil field has been upgraded with CO_2 and we have pipelines following the Powder River and highway 59 south. There are pipelines 25 miles east of Broadus in the Hammond, Montana area which runs north and south, towards Baker, Montana and we have another set of pipelines just west of Alzada, Montana.

It has been said that 21 million dollars could be saved annually. I say spread out your air-men to some of your other training complexes and stop trying to take over our local area. PN-2

Montana has already opposed this expansion years ago, our Governor and congress have said NO and still do. NP-2 NA-1

Your expansion plans take in Native American Lands and they have spoken, it is NO. NA-3

Not only do we as ranchers worry about our livestock and our safety, we also are very concerned about our wildlife. Take for example the sage grouse which have been having declining numbers and more pressure has been put on us ranchers in our graging patterns to make room for the birds. The fly overs will cause undo stress on the birds, but the ranchers will get the blame. We don't need that! BI-4 LU-1 LU-3 SA-1 SA-5 SA-17 BI-3 SO-27

More expansion means more air space control, more fly overs, more chances of crashes, more stress on the livestock and wildlife.

17

We have been impacted by fly overs at all hours of the day and night. We have experienced fly overs while working our livestock in our corrals or trailing them to pasture. These big planes fly over and scare the livestock and causes them to run, go thru fences and endanger our family and neighbors who are helping us. We have had our horses break and run or buck with us from the suprising noises when flown over. LU-3 NO-2 NO-5

As you know a safety concern of ours and our neighbors is that in the last 15 years the air force has had 2 planes go down. The first one went down north of Alzada, Mt. in Carter County, Montana. The last one in the summer of 2013 also in Carter County just outside the eastern edge of Powder River County, Broadus, Montana. SA-1 SA-5 SA-6 SA-9 SA-13 SA-20

Both of these crashes scattered debri for miles and most concerning started fires. If these crashes start range fires ~~the~~ will the air force fund more pasture for our livestock and cover all the transporting expenses. Also the flares can cause fires as well.

We also have several ranchers who fly, small planes to check on their livestock and those of their neighbors. They also fly for predator control and there are specific times to do this and they can't be dictated to by the air force as to when they can protect their livestock and property. The extra expansion means more traffic which puts our small planes in danger. SA-1 AM-6 AM-12

17

There have been several meetings over the past few years and although a few people didn't completely oppose it the overwhelming majority have said no, and have given reasons but yet the air force keeps pushing the issue.
So with all do respect, what part of NO EXPANSION don't you understand.

Fruid Ranch Co. LLC
Tracy Fruit

18

Dear: Madam Or Sirs

I am writing to express my opposition to the Air Force's proposal to expand the training airspace for Ellsworth and Minot Air Force Bases; into a larger area of southeastern Montana. To expand the Powder River Training Complex to 28,000 square miles would negatively impact our environment.

Our ranch is located 250 miles from any major medical facility; when seconds count in saving lives, we rely on our EMS Life Flight Services to transport patients 24-7-365 to Rapid City, South Dakota, Bismarck, North Dakota and Billings, Montana. My family has used this service three times in the past. I am also a EMT, our local Medical Facility Life Flight's out one to two patients a month. This expansion would not only affect Life Flight Services, it would also affect 33 Community Airports containing 285 general aviation aircraft that support our daily livelihood. Not counting all the ranch planes on private landing strips. SA-19

I am also concerned that the use of live flare and chaff release could cause wild fires that endanger lives and property. The EIS does not provide a plan for responding to these fires. SA-5

Furthermore, flights that break the sound barrier and fly as low as 500 feet stress area residents, livestock, wildlife and sage grouse. Once again, there is no proposed remediation plan for land and livestock owners in the affected area. NO-5

There is no method to provide safe separation of military and civilian aircraft. Sharing of airspace with low-flying, high-speed bombers and fighters with no radar or communications is a safety concern. Allowing greater then Mach 1 above 10,000' MSL is unsafe when you have VFR traffic in the same uncontrolled airspace. May impact our ability to check livestock, livestock water and day to day ranch activity. SA-1

I can not see how this MOA is of any benefit to Montana, if North Dakota and South Dakota want to support Ellsworth and Minot Air Force Bases move the MOA to North Dakota and South Dakota leave Montana out. PN-2

I appreciate the opportunity to comment on this proposed expansion, please take into consideration the impact it would have on our daily lives.

Sincerely,

Dane Castleberry

Airspace Study 14-AGL-06NR

Department of Transportation

Federal Aviation Administration

2601 Meacham Blvd.

Fort Worth, TX 76137

As a family member of your proposed expansion area I just wish to reiterate some of my past experiences which will become more prevalent if the proposal becomes reality:

1. I have rounded up spooked livestock in the past and spent countless hours fixing the damage to fences and facilities. I have also mended broken legs when possible and shot those that were suffering.

2. I have hauled the riders of spooked horses to the Emergency Room on many occasions and helped with therapy and chores throughout their recuperation.

3. I have spent many a day and night fighting fires that threatened our ranch and our neighbors. Many of these fires were accidentally set through obviation to weather conditions.

Ranch life has enough adversities without our military making them a daily occurrence. This is our community and a small piece of the world which we have to occupy 24-7. You have a 25,000 mile radius to practice your temporary maneuvers along with the best flight simulators which I helped to buy.

As for your proposal, until you have lived in our shoes, **NO THANK YOU**.

To: Manager, Operations Support Group

Airspace Study 14- AGL- 06NR- Powder River Training Areas

From: Concerned Pilot, SW North Dakota

I am a private pilot, in south west No. Dakota and very concerned about the proposed Powder River Training Areas. As you may know, western North Dakota has gone through a great change, with the oil activities, associated with the Bakken, Three Forks, and Williston formations. New high paying jobs are increasing, populations climbing, air traffic in double digit increases, and many airports upgrading and expanding to meet the needs of these energy companies. In fact, our local airport is moving to accommodate this increased need. Now we may be faced with many altitude, navigation, operational restrictions associated with the proposed Powder River expanded areas!! In our view, we gain nothing (no fuel sales, maintenance income, hangar rent, no income to hotels, restaurants,dealerships, etc.), but we are stuck with the proposed low altitude (500' AGL), navigation, gap, and operational restrictions?? Not to mention flares (fire potential), chaff (surface water, livestock affect), low flying fast aircraft (safety issue) and noise? We feel the areas will deter aviation business (who wants to mess with restrictions), and move our income potential to other airports outside the MOA???

If South Dakota (Ellsworth AFB) wants a larger area, move it to South Dakota!! If North Dakota (Minot AFB) wants an area, go east to the Tiger and Devils Lake MOAs already in place!! Seems like Ellsworth and Minot get the income

AM-6

PN-2

SA-5

NO-1

BI-5

SO-6

PN-2

20

and we in southwest North Dakota get nothing??

I support our men and women in uniform and support training, but there seems to be no compromise to benefit our airport and community??

A few recommendations, I believe, would greatly reduce the training area impacts-

1- area relocation , or make area # 3 a " high area "

2- raise the area (3) floor to something higher than 500' AGL, small aircraft could go under, large aircraft could go over (FL 180)

PN-2
PN-4

3-have a direct telephone line to a military training office to have instant updates for pilots, flying near the areas (other than Flight Service Stations)

AM-3,
AM-12

Thank you for your consideration.

Concerned Pilot

James H. Bragg

NORTH DAKOTA ATMOSPHERIC RESOURCE BOARD

A DIVISION OF THE NORTH DAKOTA STATE WATER COMMISSION

April 30, 2014

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth, TX 76137

Subject: Comments on the Proposed Establishment of the Powder River Training Complex Military Operations Areas, North & South Dakota, Montana, Wyoming

Dear Sir or Madam:

The North Dakota Atmospheric Resource Board (NDARB), a division of the State Water Commission, is charged with the regulation of weather modification (cloud seeding) activities in the state of North Dakota. Each summer, the North Dakota Cloud Modification Project (NDCMP) conducts airborne cloud seeding operations to enhance rainfall and suppress damaging hail in convective clouds from June through August. Flight operations are conducted 24/7 on an as-needed basis, with total flight hours ranging from 85-145 hours per season. Both project aircraft are based at the Bowman Municipal Airport in Bowman, ND.

The NDCMP currently includes Bowman and part of Slope County (District 1), which lie under the PR-3 expansion of the PRTC and in close proximity to Gaps B and C MOA/ATCAAs. NDARB is concerned that PRTC operations may impair NDCMP cloud seeding aircraft from safely carrying out their missions.

The NDCMP has a significant impact on the local agricultural economy. A 2009 economic evaluation shows that cloud seeding operations in the area affected by the PRTC proposal contribute $3 million annually in additional crop revenues and $9.2 million in gross business volume.

SA-15
SO-2
SO-28
AM-13

PRTC Flight Operations

The draft EIS recognized weather modification and cloud seeding as an affected activity in the proposed PRTC in several sections. The general recommendation for resolution of any conflict between NDCMP and USAF aircraft when the PRTC MOA is active is stated in Chapter 4.9.3.1.2:

900 EAST BOULEVARD AVENUE, DEPT 770, BISMARCK, NORTH DAKOTA 58505-0850
(701) 328-2788 • FAX (701) 328-3696 • TDD (701) 328-2750 • http://www.swc.nd.gov/arb/

21

"For non-emergency flights, such as fire reconnaissance, U.S. Fish and Wildlife (USFWS) surveys, Angel flights, and cloud seeding, the pilot could coordinate with Ellsworth AFB to work to deconflict military operations. Weather modification flights need to respond rapidly to cloud formation and other meteorological conditions. Notification to Ellsworth AFB of the seasonable possibility of cloud seeding operations and notification of when and where cloud seeding was occurring would permit the Air Force to deconflict training missions."

Weather modification aircraft operations are primarily conducted under Visual Flight Rules (VFR) below FL180, however, Instrument Flight Rules (IFR) clearance is occasionally requested for "top-seeding" flights, which are typically conducted between FL150 and FL230. The proposal indicates that civil aviation would not be prohibited under VFR conditions even when the MOA is active, and that civil and military aircraft would operate under VFR see-and-avoid rules. IFR flights, however, would be prohibited when the MOA is active, a potentially significant impairment to effective cloud seeding operations.

SO-28
AM-13

This raises a question: Will prior notification of Ellsworth AFB regarding active weather modification seeding flights in PRTC PR-3 deconflict the affected area under an active MOA to the extent that IFR cloud seeding flights are allowed?

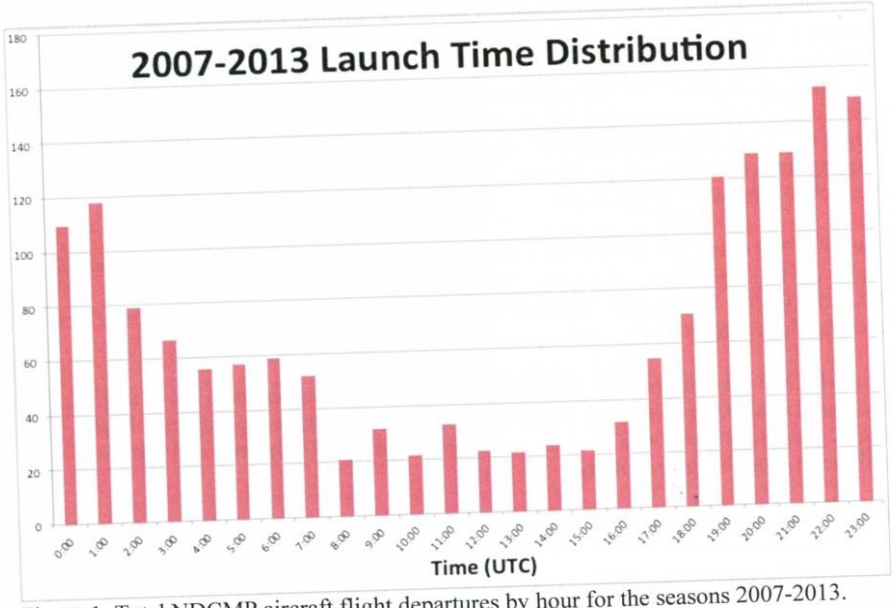

Figure 1. Total NDCMP aircraft flight departures by hour for the seasons 2007-2013.

21

The proposed schedule for PR-3 Low/High MOA and PR-3 Low ATCAA is Monday-Thursday, 0730-1200 and 1800-2330 Local, and Friday, 0730-1200 Local. The expected daily use is three hours per day, 240 days per year. This constitutes a significant amount of time where USAF and NDCMP aircraft could be operating simultaneously.

Figure 1 shows that cloud seeding flights have been historically lower in number during the morning hours. This is primarily due to atmospheric stability that sets up overnight into the morning in a normal diurnal cycle. As the day progresses, surface heating begins to destabilize the atmosphere making the onset of convective clouds and precipitation much more likely. One way to significantly deconflict USAF and cloud seeding flights would be for the USAF to use PR-3 primarily during the morning block of scheduled time, as the likelihood of thunderstorms and cloud seeding flights is much greater during the afternoon and evening hours.

Another consideration must include the fact that cloud seeding flight operations are unpredictable, as operations are dictated by weather conditions. As most flights are under VFR rules, there is no filed flight plan. Aircraft fly uncertain routes, altitudes and speeds in order to safely work around and in proximity to convective clouds and precipitation. These unpredictable flight paths may act to increase collision hazards with military aircraft.

SA-15
SO-2
SO-28
AM-13

Radar Countermeasures

The proposal also would involve the use of chaff as a countermeasure to radar detection (as outlined in draft EIS section 2.4.6.1). NDARB operates a C-band (5 cm wavelength) weather radar at the Bowman Municipal Airport to assist with weather detection and cloud seeding flight operations logistics. Chaff fibers of the proposed lengths (0.3 to1.0 inch) are ideal for jamming 5 cm wavelength radar. Thus, it is entirely plausible to suggest that use of chaff during PRTC training exercises would produce high reflectivity radar echoes, which could block or obscure weather echoes from being detected by the Bowman radar. This could have a detrimental impact on cloud seeding flights as effective operations rely on accurate, timely radar information.

Further, prior research (Arnott et al., 2004) indicates that military chaff has very slow terminal fall speeds and can persist in the atmosphere for long periods, deposited many miles downwind. The draft EIS recognizes that chaff can be "detected by improved FAA radars, so to ensure that no chaff cloud interferes with ATC, chaff would not be deployed within 60 NM of airport approach radars." Due to the importance of weather radar information during cloud seeding operations, we would request the USAF provide the same consideration for the Bowman radar as it proposes with FAA radars.

SA-16

The proposed actions by the USAF regarding cloud seeding operations in southwest North Dakota help to mitigate concerns that PRTC activity would severely impair those operations. Further, proposed actions indicate that the USAF is willing to cooperate with existing users of the affected airspace so that all missions can be accomplished. However, NDARB requests further consideration of the aforementioned issues to ensure that this important and long-standing program can continue to be effective.

21

Thank you for the opportunity to comment on the proposed establishment of the Powder River Training Complex. If I can provide further information, please feel free to contact me at 701.328.2788.

Regards,

Darin Langerud
Director, NDARB

Fort Worth, TX 76137

Reference: Proposed Establishment of the Powder River Training Complex Military Operations Areas, North & South Dakota, Montana, Wyoming

The North Dakota aviation landscape has changed dramatically since the previous public comment period regarding the Powder River airspace expansion that took place in 2010. North Dakota's long time staple exports such as sunflowers, wheat, soybeans, corn, and heavy mechanical equipment, have now been joined by petroleum products such as crude oil, biodiesel, and ethanol. The recent oil development has resulted in North Dakota becoming the 2nd largest oil producing state in the country. This is a key reason why North Dakota has the lowest unemployment rate in the nation and the highest rate of population growth since the 2010 Census.

North Dakota's aviation system has proven to be a vital resource for the efficient movement of people and products in support of the state's development. Aviation growth has been evident throughout western North Dakota through large increases in commercial passenger enplanements, airline investments, flight operations, fuel sales, based aircraft, pilot numbers, airport auto parking and car rental needs. The state recognizes aviation's contributions to North Dakota's economic success and quality of life. During the previous legislative session, the State of North Dakota appropriated $60 million dollars over 2013-2015 to assist in the infrastructure development of the oil impacted airports in western North Dakota. A large investment from the Federal Aviation Administration's Airport Improvement Program is also being provided to the western airports in the state.

In review of the current airspace study 14-AGL-06NR, the North Dakota Aeronautics Commission desires to express multiple concerns as listed below.

1. **New Bowman Airport.** A new Bowman airport is currently being constructed to accommodate the demands that exist for aviation in southwestern North Dakota. This new facility will boast a 5700 x 75 foot concrete runway and will be able to accommodate the jet traffic demand that southwestern North Dakota needs. The facility is expected to open in 2015 at a cost of approximately $16 million dollars in federal, state, and local investment. Overlaying this new airport with an MOA that can be activated from 500 feet to FL 180 has the potential to negatively affect the aviation

AM-5

P.O. Box 5020 • Bismarck, ND 58502 • 2301 University Drive, Bldg. 22 • Tel: 701.328.9650 • Fax: 701.328.9656
E-mail: ndaero@nd.gov • Web: www.nd.gov/ndaero

22

operations at this new facility. The proposed MOA could also prevent IFR non-emergency related medical flights into and out of Bowman. These outreach life-saving medical services are vitally needed in this rural area and the dependability of air access is important to the city of Bowman and the outlying communities in the area.

SA-19
SO-5

2. **Communications/Radar Concerns.** The lack of low altitude radar coverage and voice communications in this region which shares FAA Air Traffic Control (ATC) responsibilities between Salt Lake, Denver and Minneapolis ATC Centers is a safety concern of the Commission. With the proposal of the 500' AGL military operations, this lack of radar/communication coverage adds to the difficulty of being able to ensure the separation of flight by both military and civilian aircraft. The only communication that currently exists to inform the public of the activity within the MOA is the FAA NOTAM system, which is not necessarily in common use by the typical civilian rancher/farmer. Sharing airspace with low-flying, high speed bombers and fighters, with poor radar and communication services in the area, is a major operational safety concern. Additionally, the allowance for military aircraft to operate at speeds greater than Mach 1 above 10,000' MSL would also be a safety concern to VFR traffic operating in the area.

AM-3
SA-7

3. **Aerial Applicators.** Agricultural aerial application is an important industry in North Dakota as approximately 4 million acres of crops are sprayed annually throughout the state. Multiple aerial applicators base and operate in the region of the proposed MOA expansion. The Federal Aviation Administration requires that aerial applicators fly at least 500 feet above any person or structure when transitioning between fields and their airport. This requirement puts the sprayers in southwestern North Dakota at the same altitude of the proposed MOA expansion where the crews of large, high-speed military aircraft would be concentrating on training and tactical maneuvers.

SA-7

4. **Flight Instruction.** The proposed military operations area expansion would limit the region's ability to produce new pilots. Concerns of special use airspace would keep any prudent student from flying in and around areas where their skills of see-and-avoid would be critically tested.

SO-26

5. **Weather Modification Program.** There is a significant state sponsored and regulated weather modification (hail suppression and rain enhancement) program that is based at the Bowman Airport and has significant operations in this region. A 2009 economic evaluation shows that cloud seeding operations in the area affected by the proposed MOA expansion contributes $3 million annually in additional crop revenues and $9.2 million in gross business volume. The operations of this program would be significantly affected by the proposed MOA expansion as the flight operations of the program are on a 24/7 reaction time. The proposed use of chaff will also affect the radar returns utilized by this program resulting in a detrimental impact on cloud seeding flights that rely on accurate and timely radar information. Cloud seeding flights often require flying in close proximity to the clouds and at times may dictate the need for an IFR clearance. Since IFR flights are not permitted in an active MOA, the Powder River Training Area expansion also increases the risk of negatively affecting flight operations of this program.

AM-13
SA-15
SO-28

22

6. **Economic Impact of General Aviation.** The aviation economic impact for the southwest region in North Dakota has been calculated at $189 million a year with 1,152 direct employment jobs attributed to aviation. This information is provided from a federally funded Aviation Economic Impact Study in 2010. Since that study was completed, there has been a surge of oil exploration which has increased all types of general aviation aircraft traffic directly into this region. The proposed enlargement of the MOA would increase the direct operating cost of business aviation due to the extra miles needed to be flown to avoid active airspace. Flight paths for transient aircraft will need to change to avoid the active MOA and will result in the loss of productive time for the business and the passengers.

SO-7

7. **Impact to Victor Airways.** The proposed MOA expansion will impact Victor Airways that are utilized by commercial air carriers and cargo companies that provide revenue generating air service to the western portion of the state. In particular, the commercial service access to Dickinson and Williston could be impacted.

AM-5
SO-7

8. **Impact to UAS operations.** North Dakota was recently approved by the Federal Aviation Administration to become one of the six designated UAS test sites in the United States of America. One of the deciding factors of this designation was the fact that the state of North Dakota has a large amount of open and unrestricted airspace. The proposed MOA expansion would have an impact to any UAS research that could be proposed for southwestern North Dakota. Future commercial UAS operations in the southwest portion of the state could also be impacted by this proposed MOA.

AM-5
SO-7
(UAS are VFR aircraft)

After reviewing the concerns of the North Dakota aviation community as listed above, if the Federal Aviation Administration deems that the Air Force has officially justified the need for an expanded MOA; then the North Dakota Aeronautics Commission requests that the FAA and Air Force review the possibility of raising the ceiling of the proposed MOA airspace in southwestern North Dakota from 500 feet MSL to a minimum altitude of 8,000 feet MSL. This altitude change would allow aircraft operations in the area to operate under the proposed MOA without a cumbersome degree of mitigation being needed and many of the concerns listed above being addressed.

If the Federal Aviation Administration deems that the Air Force has officially justified the use of all of the current proposed airspace, altitudes, and amount of time in which the airspace will be utilized, then the North Dakota Aeronautics Commission proposes that these mitigations need to be in place before the FAA allows the Powder River MOA expansion to be approved.

PN-4

1. **Develop a Memorandum of Understanding with the North Dakota based Weather Modification Inc.**

    - An agreement with the Air Force and this state sponsored program should be in place to mitigate any negative impacts that the MOA would have to this operation.

AM-13

22

2. **Install adequate radar/communications equipment and ATC procedures that would allow IFR aircraft to be able to utilize areas within the activated MOA's.**

    - Adequate radar/communications equipment installation and a development of Memorandum's of Agreements with the Air Traffic Control Facilities is needed to allow IFR traffic to operate in and around activated MOA airspace.

AM-3

3. **MOA Activation Notice Enhancements**

    - The only communication that currently exists to the public to learn about the activation of MOA airspace is the FAA NOTAM system. An enhanced communication methodology needs to be developed to ensure that the public is better aware of which airspace is activated during certain times. Below are some examples of recommended communication enhancements:
        - Local Unicom frequencies utilized similar to an ATIS or AWOS that an aircraft can tune into to listen to updated MOA information.
        - A phone number for the public to call with a recorded message stating all new updates for MOA airspace utilization.
        - A website page that is continually updated with information regarding MOA airspace activation.
        - A 24/7 phone number for the public to call to reach a person if they have any questions regarding the MOA airspace utilization.

AM-12

4. **Efficient Airspace Utilization Plan**

    - A plan needs to be in place that details the activation and deactivation airspace process that the Air Force will utilize with cooperation from Air Traffic Control. This plan would ensure that the airspace is only active when needed for military training operations.

AM-6, AM-12

5. **Continual Review of Airspace Needs**

    - It is recommended that a sunset provision be in place and the utilization and justification of the Military Operations Airspace be reviewed every 3 years to ensure that the airspace need is still present for all sectors of the Powder River Military Operations Area. If it is determined that airspace is no longer needed for current missions, it would then be requested that the airspace be released back to the flying public.

PN-3

22

The North Dakota Aeronautics Commission understands the need for military operations areas and the continual training of airmen within the Air Force. The overall goal of the Commission is to work towards the prevention of any negative impacts to the North Dakota aviation community. This proposed expansion is complicated, unprecedented and has the potential to impact a very large area of North Dakota and the United States. The North Dakota Aeronautics Commission will continue to assist the Air Force, the FAA, and the aviation industry in working to develop a safe and efficient airspace plan for future military training needs.

To whomever it concerns:

The proposed expansion of the Powder River MOA is a highly politically motivated action by Senator John Thune of South Dakota. Why does a South Dakota congressmen have so much influence over Montana airspace?

Where was the outcry when Montana's Glasgow AFB was closed and Great Falls AFB severely cut back?

The USAF says they want to "share" airspace. 240 days a year from 0600 to 1130 and 1800 to 2330!! They want the "best" times when most of our civilian aviating is accomplished. The hours need to be reversed!!! How can the FAA justify military takeover of 35,200 square miles of our civilian airspace, 240 days per year. Current MOA's are operated as "HOT" as scheduled, even with very limited or no military operations in progress.

PN-3
GE-3
AM-6

The USAF needs this airspace for one thing, SAVE ELLSWORTH from planned DOD closure. It's not about budgets. If it is, why are B-1's from Ellsworth currently training at the Billings Logan International Airport in Billings, MT, over 200 miles away, when they have a civilian airport (KRAP) with Class D airspace 7 miles from their base, Ellsworth AFB.

GE-16

I have been monitoring and documenting the current SUA's that are currently in use. They are activated "HOT" almost all day, every weekday. Why? There may or

23

Baker Municipal Airport Commission

[redacted]

may not be military aircraft using the MOA's, but never the less are they remain active. Civilian IFR traffic is re-routed at a high cost to operators. This does not even show all the military operations in the ATCAA's.

AM-5
AM-6

Over $30 million FAA ADAP have been spent on Baker Municipal Airport and a newly constructed airport in Bowman, ND. The USAF cannot justify PR 3 to the FAA when this money has been spent to enhance safety of corporate jet traffic into these airports. KBHK even has a grooved runway surface for the jet traffic for their safety. This is an unusual accomplishment for an airport that does not have scheduled air carrier service. WE NEED THIS AIRPORT!!! With over 500 IFR civilian operations per year to KBHK, PR 3 would severely curtail the usage of these two airports. Flight training will not be able to be conducted safely at these airports. Continental Resources estimates $70,000 per year per aircraft, as well as unnecessary delays. This proposed expansion, especially PR 3, cannot be allowed with the current and future of the oil & gas industry that underlie this area.

AM-1
AM-5
AM-5
AM-12
AM-21
SO-5
SO-10
SO-17

The USAF's Powder River Training Complex Executive Summary, dated August 2010, and does not address the Oil & Gas industry that now produces 10% of the current United Sates consumption. North Dakota is now the second largest oil production state in the nation. It has surpassed Alaska in production. This needs to be address for the PR 3 area to be implemented.

SO-17

The BLM has also expressed many concerns about fires, etc. Comments were submitted to the USAF during the EIS comment period, but were never addressed either.

SA-5
SA-6

Comments submitted under the USAF EIS are not available to the public as this is supposedly a non-rulemaking proposal ??? Really??? 35,200 square miles of Civilian Airspace? !! Further, I think this whole process has been tainted by continuous negotiations & lobbying by the USAF, National Guard, and others. The USAF has provided misinformation (no civilian IFR traffic below FL180) and made

NP-2

23

Baker Municipal Airport Commission
P.O. Box 1037 • Baker, MT 59313 • 406-778-7108

false statements just to get this behemoth expansion in place. Lack of time, non-acceptance of electronic comments, and constantly changing circumstances & scenarios have severely limited public comments. — NP-2

The USAF has left no options for me under what they call three "reasonable alternatives" as PR 3 MOA is not listed as an alternative. WHY? The only proposal I can recommend is the No-Action Alternative as the USAF did not give me any other choices to save our airport. — GE-2, NP-11

Here is what can be done if the military really needs this Ellsworth AFB for its 14 aircraft, 11 of which are currently flyable. — BI-1, PN-2, PN-3, PN-4, SA-1, SA-7, SA-9, AM-1, LU-1, LU-2, LU-3, SO-4

1) Remove Area PR3

2) Install ground based radar and communications for FAA Center Air Traffic Control to provide ATCAA's only when the military actually has aircraft in this airspace.

3) No low altitude, less than FL180, during the LFE's as they pose an extreme hazard to persons, property, livestock, & industry. LFE's are totally unjustified over populated areas.

4) Powder River MOA must be eliminated if Ellsworth AFB is closed.

I am enclosing letters from current and former congressmen opposing this expansion. This expansion is totally un-justified and needs to be eliminated, or at least severely reduced in size. LFE's do not belong over populated areas, livestock, and Montana's serene ranches.

Dear Sir:

The Perkins County Board of Commissioners instructed me to forward you a copy the resolution which the Perkins County Board of Commissioners passed on November 3, 2010. This resolution is in opposition to the expansion of the Powder River Training Complex within the boundaries of Perkins County.

Thank you for your consideration of the stand which the Perkins County Commissioners have taken.

Sincerely,

Sylvia Chapman

Sylvia Chapman
Finance Officer

24

RESOLUTION 2010-16

WHEREAS, Whereas, the United States Air Force has announced the expansion of the Powder River Training Complex to encompass Perkins County, South Dakota and its surrounding area; and

Whereas, Perkins County consists of many patriotic citizens that support our military forces with their personal sacrifice and moral support; and — GE-9

Whereas, the expansion of the Powder River Training Complex would adversely affect air traffic in and around Perkins County; and — AM-5, AM-6

Whereas, the interruption of air traffic for any specified period of time will undoubtedly cause negative economic impact and potentially cause disruption to predator control efforts; and — SO-7, LU-3

Whereas, wind development and any other types of tower development may be stymied by the expansion of the Powder River Training Complex; and — NP-6, SO-17

Whereas, Perkins County derives its economic base and existence from agriculture, including the production of livestock and management of thousands of acres of grassland that could be endangered by the increase risk of fire; and — SA-5

Whereas, agricultural producer's property values will likely suffer from the military activity that will take place in many cases five hundred fifty feet above their property, cause noise, inconvenience and a breach of quiet enjoyment of their property; and — SO-19, NO-5

Whereas, the private property rights of area landowners will be infringed upon by the expansion of the Powder River Complex Expansion; and — GE-7

Whereas, other private property owners are compensated when the government devalues property and are deemed a taking; and — SO-19, GE-7

Whereas, the Air Force has alternatives for training exercises and the expansion of the Powder River Complex is not necessary; and — PN-2

Whereas, the Powder River Expansion will adversely affect the County of Perkins, its residents with sonic booms, littering of metallic chaff and firing of flairs above our grasslands, lakes and communities, all causing a reduction in property values and interruptions in commerce; and — PN-2

Whereas, Perkins County proposes that all citizens share in the negative impact of military training areas and not limit such training areas to only rural areas; and — EJ-2

Whereas, rural areas are known for providing the military with the best and brightest soldiers and that rural citizens from across this nation are often known for stepping up and fighting the wars of the United States of America; and — GE-9

Whereas, several adverse environmental affects will be experienced by the Powder River Training Complex Expansion and thus in violation of federal environmental law and — NP-11

24

NOW, THEREFORE, BE IT RESOLVED, that the Perkins County Board of Commissioners strongly oppose the expansion of the Powder River Training Complex within the boundaries of Perkins County, and feel that it is the County's responsibility to protect the safety, livelihood and way of life of the citizens of the County. GE-2

Dated this 3rd day of November, 2010

25

To: Manager, FAA Airspace Study 14-AGL-06NR March 10,2015

From: Bowman County Airport Authority

Subject: Proposed Powder River Training Area Expansion

We am very concerned about the negative impact from the proposed Powder River expansion.

1- Economic Growth Impact- The companies involved with OIL, coal, natural gas, wind charger energy,etc., will have to alter flight operations into our local airport. Bowman is building a new airport to accommodate larger aircraft associated with the Bakken and Three Forks oil formations. The proposed military areas will have many airspace , altitude, and operational restrictions, which will divert these company plans to other airports, outside the training areas. This impact will trickle down, affecting the economic bottom line for the new local airport, fuel sales, maintenance, hangar rent, etc. Also affected would be local hotels, small businesses, restaurants, etc.

AM-1
AM-5
AM-21
SO-5
SO-6
SO-8
SO-9
SO-10

2- Bowman Community operations- Many small rural hospitals rely on medevac and lifeflight operations to Bismarck for emergency care. These operations in military areas require undue flight time, extra navigation, corridor entry and exit points, altitude restrictions, etc., where timing is essential for care.

SO-5
SA-19

3- North Dakota Atmospheric Board- Bowman and Slope counties utilize Weather Modification program for hail suppression and rain enhancement. Timing is critical with these operations, and the military area restrictions

AM-13
SA-15
SA-18
SA-19

25

would greatly limit the effectiveness of these aircraft to operate at the precise time.

4- Fire Fighting Operations- Our community uses aircraft with rural fire departments, to assist in scouting, positioning of fire vehicles and equipment,etc. The use of military flares (burnt or duds) is a major concern to these rural fire departments. — AM-33, SA-5, SA-6

5- Wildlife Management- Our community has an abundance of wildlife. Hunters from all across America fly here to hunt. The Game and Fish Dept. utilize aircraft in their wildlife management programs. Restrictions will have an economic impact on hunting lodges, B & B's, hotels, restaurants, taverns, etc. — LU-5, SO-9, SO-15

6- Aerial Applicator Operations- North Dakota leads the country in honey production. These sensitive areas, along with wind charger towers, and new cell phone towers, require crop dusters to fly higher, in transit. These operations would be in the 500' above ground restricted airspace, which could pose a safety hazard. — LU-4, SO-20, SO-28

7- Livestock Production- Producers are already affected by dust pollution, with the increased oil truck traffic. Another concern will be military chaff dispensing . Will this have an effect on animal or wildlife ingestion or contamination of surface water supplies? — BI-5, SA-14

8- Renewable Energy- Up to 130 wind charger sites have been proposed in our area. Will these towers affect the military radar signals? Again, lower flying

25

aircraft will have to avoid these sites or fly higher. The higher altitude will be in the 500' above ground restricted airspace, which will be a safety hazard. — SA-24

Economic growth and development, along with agricultural commodity production are essential for the survival of many southwestern North Dakota communities. The expanded Powder River training areas would greatly impact the growth potential and well being of our local community. — SO-2, SO-5, GE-3, LU-1, SO-4

Considering the above items, I hope some modifications could be made to the Training areas. Some recommendations include:

A- Make use of present military areas in North and South Dakota. — PN-2, PN-4, AM-3, AM-12, AM-21

B- The 500' above ground restriction to be used 1 or 2 days/ week instead of 5 days/ week.

C- Raise proposed area floors from 500 feet to 8000 feet.

D- Provide a direct telephone/ web contact to the Air Force training center to give instant updates to pilots flying near the training areas.

We thank you for your attention and hope these recommendation will be considered to reduce the impact.

Bowman County Airport Authority Supervisors:

Rodney Schaaf Bob Morland John Soreide Andy Mrnak

RE: Air Space Study 14-AGL-06NR

To Who It May Concern: :

We are writing to express the following concerns regarding the PRTC:

We oppose flight restrictions which would negatively affect the operations of local airports and individual farmers and ranchers who fly to check cattle and crops, and other commercial, emergency, and recreational fliers. AM-5 AM-6 SO-5

The USAF has failed in the past to timely indemnify farmers and ranchers for damages they caused. We feel the risk of fires from flares and chaff may be significant and it's a matter of when, not if, an accident will occur. The area in question contains productive farm and ranch land, but is sparsely populated, which means the volunteer firefighters have limited resources. SA-5

We are concerned about low-level flights under 500 feet, which may or may not be supersonic. If the USAF would create a means in which damages would be mitigated immediately, it would ease our concerns. AM-14

We thank you in advance for your time and attention to this matter. If you have any questions, please feel free to contact our office. GE-9

Best regards,

Alan Aker, Chairman
Meade County Board of Commissioners

27

TO: Manager, Airspace Review April 1, 2014

FROM: Scott Bachmeier

SUBJECT: Proposed Powder River Expansion

Dear Manager;

I am very concerned about the proposed Powder River Military area expansion plan. I am very interested in the expansion impact on our area wildlife and livestock! The propose plan has many altitude restrictions, which will impact many aviation activities. North Dakota Game & Fish Dept. use aircraft in their wildlife management programs, to track various deer, antelope, birds, cats ,etc. BI-4 PN-4 SA-8

Hunting is big business here, will these restrictions impact hunters that fly into our local airports? Will this impact trickle down to the hunting lodges, hotels, cafes, stores, etc.? Aircraft are also used in fire fighting by our local rural fire departments. Will this impact affect that ability to direct fire fighting equipment to control grass fires? We don't need more fire potential like flare drops here! LU-5 AM-33 SA-13

Other concerns are low altitude fast flying aircraft mixing with small aircraft, oil companies schedules being impacted by area restrictions, aircraft medical doctors schedules impact, and crop duster operations. SO-17 SO-2 SA-18

Please consider some recommendations- PN-2

1- move areas to existing military areas

2-raise training floors higher than 500 feet above the ground AM06

3- limit the LOW altitude to 1 day per week - Thank you for your time

Scott R. Bachmeier

TO: Manager, Airspace Study, Operations Support Group

FROM: Rural Fire Department , Bowman, North Dakota

SUBJECT: Powder River Training Areas

Many local Rural Fire Departments are very concerned about the proposed Powder River training expansion areas. Our community has undergone great changes associated with the Bakken and Williston Oil activities. New high paying jobs are increasing, populations growing, air traffic increasing, with local communities trying to keep up with demand in services.

Rural fire departments, hospital and clinic staff, ambulance and EMT staff, and Emergency Response offices are impacted by these increased needs.

Now we may be required to do more with the Powder River Area which is Area #3 overlying our community! The potential for aircraft mid airs or crashes is real, with the proposed 500 foot altitude restriction. Also fire potential is a concern, with flare dropping operations. How will these area restrictions impact local health services, such as med-i-vac and life flights to transport patients to larger facilities? Some recommendations could greatly reduce these impacts include: 1- NO area #3, or a " high area" designation, 2- raise area floors to 8000 feet, 3- 500 feet restriction 1 day/ week instead of 5 days.

SA-1

Powder River MOA Proposal

We are writing to address the concerns we have for the Powder River "Military Operations Area" (MOA) Airspace Proposal that has been submitted to the Federal Aviation Administration by the US Air Force. They are requesting approval that will quadruple the size of the already existing MOA. The expanded MOA if approved and when active will reduce the maximum operating flight altitude to 500 feet for non-military aircraft. Because of these restrictions, several airports in the area such as Bowman, Elgin, Hettinger and Mott airports will have highly restricted operations. The proposal we would like to make is that the base altitude of the MOA should be raised to at least 8,000 feet so that general aviation, business aviation, and commercial flights can still safely occur. If the proposal doesn't change, and it is adopted as written, business and medical flights may not even be allowed to operate in this area, which would greatly affect the quality of care for medical patients in that part of our state in a time of greatest need. Both the Bowman and Hettinger communities have medical facilities that rely on access by medical specialist from larger metropolitan areas that fly in to those communities to provide medical care and consultations. Without those flights, health care will suffer.

AM-6

SO-5

In addition, should adjustments not be made to the proposal, there are considerable safety concerns that should be addressed. Because of the poor radar and communication services that exist in the area, VFR (visual flight rules) general aviation flights would face major safety concerns sharing airspace with low-level, high-speed bombers operating in close proximity. Business and general aviation would be forced to spend additional time and monies to avoid the MOA. Flight training in this area would be highly discouraged. IFR (instrument flight rules) flights into and out of the area would not be allowed. Weather Modification in the area would be eliminated because of their "last minute" requirements to treat weather for increased rainfall and hail suppression. Aerial applicators transitioning between airports and farm fields would be utilizing the same airspace as the military aircraft, but without the safety blanket of radar or communications since their reliability in that area does not exist. Livestock operations in the area will have noise disturbance issues with low level high speed supersonic aircraft operating in the area at Mach 1 speeds.

AM-3

SO-36

SO-28

SO-2

Our other suggestions for change to the proposal prior to it being approved would include:

- A "memorandum of understanding" between the US Air Force and weather modification companies during the months of their operation of June through August, allowing for their operations.

SO-28

29

- An installation of adequate radar/communications and ATC procedures which would allow IFR aircraft to utilize the area when the MOA is active.
- A series of enhancements for "notification of activation of the MOA" to the general public such as announcements over a local Unicom frequency, a public phone number to call for MOA information, along with a website that includes updates on airspace activation and deactivation.

AM-3

- The airspace needs an Efficient Airspace Utilization Plan agreement between the military and Air Traffic Control to ensure activation only during military training operations.

AM-1

- A provision should be in place whereby the Military Operations Airspace should be reviewed every 3 years to make sure the designated airspace is still needed. If the airspace is no longer needed it should then be released back to the flying public.

We realize that it is important that military flight crews have secured airspace for flight training purposes. Please consider the suggestions we have made so as to make a safer operating environment for all the aircraft traffic that is affected by the application of this proposal. Thank you for your time to read our concerns and for considering the changes we have suggested.

Respectfully,

Rod Brekken, Chairman – North Dakota Aviation Council

30

WRITTEN COMMENT SHEET
Power River Training Complex

The air force says they need this new area for there training—But at who's expense? The air force says lots of thing but most statements are for there benefit and what not to real life, and how it effects us living under the fly zone.

We are worried and scared of what lies ahead of us that live under the fly zone. We have heard that they say one thing and lots of time they do different, and we that live here have to adjust to the situation. Oh they have gotten lots of comments and hearings on the matter, but attending the meetings and hearing you walk away with the feeling that they don't care and that they are going to get there way come high water. **GE-5**

We have been under the fly zones and they do scare cattle, and people. Especially in the middle of the night some flies over you are awaken out of a good sleep, then it takes for ever to go back to sleep, which is not good for the body. **NO-5**

The value of our property goes down and if we did want to sell, who would want to buy it {your property} if you lived under a fly zone. **SO-1**

The increase of the fire danger with them using the flares would increase greatly. They say they would monitor if in a drought area, mainly August. But we can have a drought season from June----September. **SA-5**

The speed the flares fall to the ground is unreal, up to 100 mph, and if they don't ignite and hit a person are any kind of livestock, or even wild life it would not be good. And this is acknowleded in the Air Force impact statement.

Even in there impact statement they say the dud flares are rare, but extremely dangerous. So why take a chance. Then they say if you fine a dud flare you have to call them and they will take care of it. Who has the time for all of this. **SA-27**

Also they can deploy chaff, and the inch long aluminum coated silica and these tiny fiber strands drift to earth and get into our stream, lakes,water tanks, in our grasses and our hay and we feed our livestock , .WE ALL KNOW THAT ALUMINUM CAUSES ALL TIMERS. AND THE TINY FIBERS COATED WITH SILICA CAUSES CANCER. We know what you folks think that it will not happen and it's not a danger to us, livetstock or the eviroment. We don't want to take the chance on this our life is important to us and our families. **SA-14**

What you folks are planning to do is destroying a way of life in the small rural towns and areas, and we don't like that, **LU-2**

Our airports will be in trouble, and there are comments that out of the area, state fliers will not come to here and have to cope with your low flying planes. Our medical air lift **AM-5**

30

has said the same thing, so now you are endangering our lives, because we can not be air lifted out of here. I don't think we should be put in this kind of situation. SA-19

Our little towns are having trouble staying afloat now, and this will just cause an other hardship upon us all.

There have been things that the EIS did not make any comment concerns on what the conception rate{rebreeding } of livestock and wild life would be, also the concern of the contamination of the sheep's wool by filaments{cancer causing agent in the chaff}. Again our lively hood is at stake. BI-4 BI-5 SO-16

We that opposes this expansion is said to be non-patriotic which would not be the truth. We support our troops and there efforts, but not at our expense of our lively hood. GE-9
Facts we have learned: B-1 was developed as a long-range super-sonic bomber with low-level capabilities, but why does it have to tested at 500 ft.
The B-1 top speed is 830 mph,----13.84 miles per minute----1218 feet per second---4 seconds per mile.

THIS MOA BELONGS IN THE DESERTS OR OVER OPEN-WATER NOT WHERE THERE ARE PEOPLE, FARMES, RANCHES SMALL TOWN, AIRPLANES, AND VALUAVLE RRESOURCES. WE ARE IMPORTANT TO. PN-2

WE HAVE BECOME A TARGET FOR EVERYTHING THAT NOT GOOD
WE SUGGEST NO-ACTION ALTERNATIVE

Mrs. J. Robert Rusley

[redacted]

31

POWDER RIVER TRAINING EXPANSION PLAN

I J. Robert Rusley would like to make a comment on this new plan. I live 35 miles southeast of Baker, Mt.,& 35 northeast of Ekalaka, Mt and 42 miles northwest of Camp Crook S..D. I have dealt with low flying bombers before and all they did at that time was spook our livestock and they would run and tear down fences and then we had miss matched mothers, and we had to take time and get calves back with the right mother. This all takes time and cost money. Who is going to pay the bill for damages? Then in a short period of time a other bomber comes over, and in the middle of the night , It's not good at all for human and animals---But who cares? I don't think the Air Force Cares at all. SO-13 SO-12

I like to tell you folks in the spring we spray for weeds & noxious weeds in the fields and of course we have aerial spraying also for grasshoppers, well now just when can we hire a aerial sprayer to come and do these things for us, cause you and your plans has put a end to that.. Sounds like our life has to change just because of your big plans, I think it is time for you folks to think about something more then yourself. SO-2

It seems like our local airports can just shut down because of you folks and your plan. So we have to plan our HEART ATTACKS, STROKES, ACCIDENTS ON THE FARMS AND RANCHES, WHICH CAN HAPPEN. Also there have been a OIL RIG FIRE/ ACCIDENT and we know that some of the PIPELINES CAN HAVE AN EXPLOSION and then they fly in oil and gas representatives. OH YES THR AIRPORTS OR CLOSED BY THE AIR FORCE. SO-5 SO-17
And how would your family feel when they would not be able to

fly a love one out for medical help, We should not be put in a bad situation just because of where we live, and for your war game combats training. There is the deserts and lots of ocean, and it would not bother anyone that we know of, just a few more miles for your bombers to go to practice. PN-2

I know the bombers will be releasing flares and you know that the flares have aluminum and that causes all timers, and the fibers that are coated with silica can cause cancer. We care but your actions tell us different. Also the chances of it starting a fire is pretty great, especially if it's dry. Now we have a fire, and in these area we depend on a aircraft to guide the ranchers and fire trucks into the fires, and this sure can save on how fast a fire can travel . SA-14 SA-12

I just read that the environmental impact report conducted for the expansion has not been released which raised a question why the Air Force chose to move forward on the planning of the expansion. Seems like you folks put the cart before the horse. But maybe that is the way you do business, along with the government.

We strongly suggest that you keep the training area as is, or move it to the desert, or ocean.

We say NO TO THE AIR FORCE TRAINING EXPANSION PLAN.

31

For a change think of the hardships you are putting the people and little communities in this area in.
We have not asked for any of this inconvenience, but seems like when you folks don't care you can just walk over the top of us and our little towns.

We do thank you for the opportunity too make our feeling known, and we will be lucky if you read any of this, but this is how we feel

LU-3

Robert Rusley

[redacted]

32

POWDER RIVER TRAINING EXPANSION PLAN

I would like to ask the Air Force are you planning on making these little towns and communities new GHOST TOWNS. Boy it sounds like that is what you all are setting out to do. Your expansion is going to effect 33 communities and there airports, and at lease 285 general aviation aircrafts. This will effect there livelihood and you all think this is O.K. to do this to the people and the business in the area. **LU-2 SO-10**

You folks quoted that: Plans for the Powder River Training area that currently spans South Dakota, Wyoming and Montana to be expanded into an 18-million acre bomber training complex that would sprawl over southwest North Dakota, Wyoming, and Montana. U.S. Air Force crafts from Minot Air Force Base and Ellsworth Air Force Base in Rapid City would utilize the area for exercises five days each week and 10 to 12 days of the year, host large force exercises across the stretch. In other words playing war games without actual combat.

Listed below is just a few of the things this expansion will destroy and change:

1, There is lots of farmers & ranchers depend on air spraying for weeds in crops and noxious weeds. Remember we only have 93 days in a year in order to do these projects.

2, Now our little towns have to spray for mosquito in the summer so maybe we might not get West Nile & die. Spraying does help with mosquito control, but remember we only have 93 days. Hope the mosquito gets bad on the right day. **SO-2**

3. The oil companies & pipeline companies arrive at our local airports for meeting and check on production in gas & oil. With it closed they will have to go else where and drive back. Also planes go up to check pipelines for leaks & spills, and when they can not fly things go unnoticed, and a lot of damage can happen real quick. Sounds like you folks really don't care. **SO-17**

4. Air ambulance will not be able to land. So I guess if we are to have a hearth attack, stroke, an accident, are something else tragic we got to plan it in you 93 days that the air ambulance could come in... I wonder if we could sue the air force for the loss of a loved one, because the air ambulance could not land. How would you feel if you could not get a love one flown out for emergency help. And heaven help that this would never happen, but an oil rig burns, or a pipeline explosion, and there has been some in the pass, & no air ambulance, no oil field representative can fly in, for emergency shut in on a well site and it will be a big mess. Why because our airports are shut down except for 93 days. **SA-19 SO-5**

5. And we know that the flares have aluminum in them and that causes all timers, and the tiny fibers coated with silica causes cancer. And there is always a a possibility that they could cause a fire, and of course no planes can fly to locate fire and direct fire trucks, which is bad to, because we depend on the planes in the air to guide people & fire trucks into the fires **SA-14**

When it comes to ranches we have had problems in the past with the low flying air **SA-5**

32

crafts, the livestock are really restless when the low flying aircraft are in the area, they spook, run and young calves get separated from there mothers and through the fences, and it takes time and money to repair fences and to gather and get them in the right spots. Horses have been cut by barbwire from being scared by the low loud flying aircrafts, and have broken down corral walls. **BI-2 BI-4**

So I say that your expansion is sure will cause lots of problems and heartache, but seems like you folks really don't care, and who is going paid for the problems that the air force is causing us, can we send you the bill **GE-8**

We the people in this area I think just wants to be left alone, and let us live on the precious land that the Lord gave us to live on and to make a living . We also like our little towns & communities. Have the regular things that is offered to people that his not in the fly pattern. **LU-1 SO-4**

We strongly suggest that you folks take your practice area to the deserts. The snakes, and other desert animals might not care but we do care. **PN-2**

WE SAY NO TO THE AIR FORCE TRAINING EXPANSION PLAN.
PLEASE CONSIDER OTHER PEOPLE FOR A CHANGE **GE-2**

We do thank you very much for having the opportunity to makes our feelings known.

RE: Comments on Proposed Establishment of Powder River Training Complex Military Operations Areas North & South Dakota, Montana, Wyoming

The Ranchers-Cattlemen Action Legal Fund, United Stockgrowers of America (R-CALF USA) appreciates this opportunity to provide comments on the Proposed Establishment of Powder River Training Complex Military Operations Areas North & South Dakota, Montana, Wyoming (PRTC expansion). The comment period for the PRTC expansion was extended to May 3, 2014.

R-CALF USA is a non-profit association that represents thousands of U.S. cattle and sheep farmers and ranchers in 43 states, along with numerous state and local cattle association affiliates. R-CALF USA's membership consists primarily of cow/calf operators, sheep producers, cattle backgrounders, and feedlot owners. Various main-street businesses are associate members. R-CALF USA works to sustain the profitability and viability of the U.S. cattle industry, the largest segment of U.S. agriculture.

On August 4, 2008, R-CALF USA submitted comments to the United States Air Force (USAF) regarding the first proposed PRTC expansion. In our comments, we explained how the PRTC expansion would likely disrupt the business operations of approximately 11,054 cattle ranches within the proposed region and we urged the USAF to consider other training options that would not interfere with so many vital food-producing businesses.

Our comments explained how low flying military aircraft, including those that generate sonic booms or shockbursts, can adversely affect the health and productivity of livestock, cause the destruction of livestock handling and containment equipment (e.g., fences and corrals), create safety hazards to ranchers and their employees, and cause the destruction of forage and other property due to fires.

The current PRTC expansion proposal does not address the concerns R-CALF USA raised on behalf of its rancher-members in 2008. The PRTC expansion proposal still appears to cover the same geographical area, it still proposes military flight altitudes as low as 500 feet above ground level (AGL) and supersonic flight above 10,000 AGL, and it still allows the deployment of chaff and flares that can cause damaging fires to prairie lands and forested lands alike.

LU-3

SA-5

33

R-CALF USA's 2008 comments also revealed that the approximately 11,054 ranching operations within the proposed PRTC expansion area generated approximately $886 million in annual cash receipts in the mid 2000s, and they likely generate more than that today.

LU-3

R-CALF USA believes it is unnecessary for the USAF to disrupt so many vital food-producing businesses, whose cash receipts are critically important to the economic well being of the entire area under consideration, when there are far less populated expanses in the more arid areas in the southwest that can be used for military exercises.

For convenience, below is an excerpt from R-CALF USA's 2008 comments that provide greater detail regarding our ongoing concerns for the PRTC expansion. The exhibits that accompanied the original comments are excluded here but are available upon request.

Excerpts from R-CALF USA's 2008 Comments:

I. The Region Affected by the Proposed PRTC Expansion is Unique and Vitally Important to the Overall Viability of the United States Cattle Industry.

Montana

Based on information provided by the USAF during an informational meeting held in Miles City, Mont., on July 28, 2008, the proposed expansion of the Powder River Training Complex (PRTC) would include the following Montana counties: Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone, along with the Crow Reservation and the Northern Cheyenne Reservation.

According to the 2002 Census of Agriculture (latest data available), these eight Montana counties support 3,141 individual ranching operations that control 11,809,155 acres of pastureland used for livestock production.[1] On Jan. 1, 2008, there were 585,100 head of cattle and calves held on ranches in these eight counties.[2] Cash receipts from the sale of livestock and livestock products in these eight counties were over $270,645,000 in 2005 (latest data available).[3]

North Dakota

Based on information provided by the USAF during an informational meeting held in Miles City, Mont., on July 28, 2008, the proposed expansion of the Powder River Training Complex (PRTC) would include the following North Dakota counties: Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope and Stark, along with the Standing Rock Reservation.

According to the 2002 Census of Agriculture (latest data available), these 10 North Dakota counties support 3,120 individual ranching operations that control 4,614,974 acres of pastureland used for

[1] *See* Table 8. Farms, Land in Farms, Value of Land and Buildings, and Land Use: 2002 and 1997, 2002 Census of Agriculture – County Data (Montana), U.S. Department of Agriculture, National Agricultural Statistics Service (hereafter "USDA-NASS"), Attached hereto as Exhibit 1 ("Pastureland, all types"), pp. Montana 263-270.
[2] *See* All Cattle & Calves, Inventories by Counties, Jan. 1, 2008, Montana, USA, USDA-NASS, attached hereto as Exhibit 2.

33

livestock production.[4] On Jan. 1, 2008, there were 445,000 head of cattle and calves held on ranches in these 10 counties.[5] Cash receipts from the sale of livestock and livestock products in these 10 counties were $174,661,000 in 2006 (latest data available).[6]

South Dakota

Based on information provided by the USAF during an informational meeting held in Miles City, Mont., on July 28, 2008, the proposed expansion of the Powder River Training Complex (PRTC) would include the following South Dakota counties: Butte, Corson, Hardin, Lawrence, Meade, Pennington, Perkins and Ziebach, along with the Standing Rock Reservation and the Cheyenne River Reservation.

According to the 2002 Census of Agriculture (latest data available), these eight South Dakota counties support 3,141 individual ranching operations that control 8,749,836 acres of pastureland used for livestock production.[7] On Jan. 1, 2008, there were 529,000 head of cattle and calves held on ranches in these eight counties.[8] Cash receipts from the sale of livestock and livestock products in these eight counties were $291,036,000 in 2006 (latest data available).[9]

Wyoming

Based on information provided by the USAF during an informational meeting held in Miles City, Mont., on July 28, 2008, the proposed expansion of the Powder River Training Complex (PRTC) would include the following Wyoming counties: Campbell, Crook, Sheridan and Weston.

According to the 2002 Census of Agriculture (latest data available), these four Wyoming counties support 1,652 individual ranching operations that control 7,249,640 acres of pastureland used for livestock production.[10] In 2006, there were 272,000 head of cattle and calves held on ranches in these four counties (latest data available).[11] Cash receipts from the sale of livestock and livestock products in these four counties were $149,357,000 in 2006 (latest data available).[12]

33

Montana, North Dakota, South Dakota and Wyoming

The 30 counties in the four states affected by the proposed PRTC expansion are each counties with significant livestock production. Together, these counties represent an integral component of the U.S. livestock industry that helps to ensure the United States remains largely self-sufficient in the production of red meat – an important factor in maintaining the nation's food security.

As revealed by the foregoing data, these 30 counties support 11,054 individual ranching operations that control 32,423,578 acres of vital pastureland used for livestock production. These counties maintain approximately 1,831,100 cattle and calves, which represent more cattle and calves than are maintained in the entire state of either Wyoming or North Dakota, and is more than twice the number of cattle maintained in the entire state of Utah, a state where the USAF currently conducts training operations.[13] The annual cash receipts from livestock production in these 30 counties are approximately $885,699,000.

Based also on the foregoing data, the average cattle herd size per ranch in this 30-county region is approximately 166 head per ranch. This average size of the U.S. beef cow herd is only approximately 43 cows per herd.[14] Thus, the herd sizes in this 30-county region, which largely consist of beef cattle, are roughly four times larger than the national average herd size. Moreover, as a result of the ongoing exodus of U.S. cattle operations,[15] there remains only approximately 78,360 beef cattle operations in the entire United States with herd sizes larger than 100 head.[16] Thus, based on the approximate number of cattle operations (ranches) discussed above, and presuming they are all beef cattle operations, this 30-county region represents as high as 14 percent of United States cattle herds that are larger than 100 head.

These factors indicate that many, if not most, of the ranches within this 30-county region are of sufficient size to be considered economically viable cattle operations, which are becoming rare in the United States. These factors further suggest that many, if not most, of the ranches within this region depend exclusively on the production of cattle for their livelihoods. Together, these factors demonstrate that this 30-county region is unique in its ability to sustain economically viable cattle operations and demonstrate just how important the livestock production within this 30-county region is to the overall viability of the United States cattle industry.

The principal concern of R-CALF USA is that the proposed PRTC expansion could result in the disruption of this 30-county region's ability to continue maximizing livestock production. Below are a number of factors associated with the proposed PRTC expansion that could result in a reduction of livestock production within this 30-county region – an outcome that would adversely affect the profitability and viability of the thousands of independent cattle operations within the region.

[16] *See id.* ("Cattle and Calves: Number of Operations and Percent of Inventory by Size Group, U.S., 2006-2007).

33

II. The Potential for the Proposed PRTC Expansion to Disrupt Livestock Production is Significant.

The training activities proposed for the PRTC expansion include high-speed and low-level flights involving multiple aircraft, supersonic flights, and deployment of flares and chaff. The high-speed and low-level flights and supersonic flights bear the potential to create stress in livestock. Anecdotal evidence presented by ranchers attending the July 28, 2008, informational meeting in Miles City, Mont., suggest that in the existing PRTC, and in other regions were military flight training is conducted (e.g., Nevada), ranchers experienced property damage (e.g., cattle stampeding through corrals and fences) and low conception rates attributed to the training exercises. The increased potential for fires resulting from flare deployment, which could potentially wipe-out the production capabilities of one or more independent ranching enterprises for an entire production season, is also a significant concern.

SO-13
BI-4
SA-5

Given the unique importance of this 30-county region to the overall viability of the U.S. cattle industry, the USAF should scientifically and quantitatively evaluate the potential that the following risks would potentially occur, and the frequency at which they would potentially occur, over an extended period of time before any further consideration of the proposed PRTC expansion.

The risk to livestock health

In addition to general stress that would be expected to result from livestock being startled from the sudden appearance, noise, and airwaves of high speed, low-flying aircraft, the USAF should conduct a study to determine the specific impact that shock bursts caused by supersonic flight would have on livestock health. A researcher in the United Kingdom, now deceased, recently attracted international attention with his theory that aircraft-induced shockbursts may have contributed to the outbreak of transmissible spongiform encephalopathies (TSEs) in the United Kingdom and Canada.[17] Though this theory is not currently accepted by the scientific community as the most likely cause of TSEs, it is not clear that it has been scientifically disproven either. A 2003 study by Harvard University acknowledges the researcher who formulated the theory, thus substantiating the researcher's credibility.[18] Studies to determine the potential health impacts to livestock from aircraft-induced shockbursts should be conducted before subjecting the livestock-dependant, 30-county region to such activity.

Risk to Livestock Productivity

Livestock would likely be most susceptible to increased stress caused by increased aircraft activity during ovulation, conception, and calving, all of which are events that directly impact the productivity of a livestock operation. In addition, increased stress may have a more generalized impact on livestock feed conversion. In other words, subjecting livestock to periodic stressors may reduce the ability of livestock to efficiently convert feed to pounds of gain, which is a key determinant of a livestock operation's profitability. Importantly, the U.S. Government Accountability Office (GAO) explained that "[c]attle have the longest biological cycle of all meat animals."[19] Thus, the extended time

BI-1
BI-2

[19] Economic Models of Cattle Prices, How USDA Can Act to Improve Models to Explain Cattle Prices, U.S. Government Accountability Office (formally the General Accounting Office), (GAO-020246, March 2002, at 30.

33

needed to breed, birth, and grow cattle would necessitate an extended study period to fully evaluate the potential risks to cattle productivity resulting from the proposed PRTC expansion.

Risk to Livestock Fences, Facilities, and Livestock Handlers

Stampeding livestock can destroy fences, corrals, and other facilities resulting in injury to both livestock and livestock handlers. As mentioned above, anecdotal evidence suggests this already occurs in existing training sites. The USAF should quantitatively determine the expected frequency and intensity of these risks to both livestock and livestock handlers. SO-13

Risk of Fires from Flare Deployment or Aircraft Accidents

Even if the risks of fire from flare deployment or from aircraft accidents are low, the consequences of such a risk could be extremely high. Any fire in the 30-county region could potentially destroy the grazing potential for prime grazing lands for an entire growing season, resulting in severe financial consequences for affected ranches. SA-5

III. Conclusion.

For the reasons set forth above, R-CALF USA believes the potential risks associated with the proposed PRTC expansion are likely substantial and could significantly impact the important livestock production enterprises within the affected region. R-CALF USA urges the USAF to consider other options with which to achieve its training objectives that would not subject this important livestock production region to potential risks that are known to exist, but which have not yet been scientifically quantified.

Sincerely,

Bill Bullard
CEO, R-CALF USA

RE: Request for comment period extension for airspace study 14-AGL-06NR, the proposed Powder River Training Complex MOA

Dear Mr. Wheeler:

EAA (the Experimental Aircraft Association) is the world leader in recreational aviation. With an international membership of more than 180,000 people in more than 100 nations, EAA brings together pilots, aircraft owners, and aviation enthusiasts who are dedicated to sharing *the Spirit of Aviation* by promoting the continued growth of aviation, the preservation of its history and a commitment to aviation's future.

EAA requests a 90-day extension to the public comment period for airspace study 14-AGL-06NR regarding the proposed establishment of the roughly 28,000 square-mile Powder River Training Complex military operating area (MOA). We believe that the original 50-day comment period, which is slated to close on April 3, 2014, is inappropriately brief given the enormous scope and size of the proposed MOA.

We believe that a 90-day comment period extension will allow potentially affected stakeholders the opportunity to become properly educated about the proposed airspace designations, analyze their findings, and prepare meaningful, informed commentary for the FAA.

Thank you in advance for your consideration for this important manner. If you should have any comments or questions regarding EAA's request, please do not hesitate to contact me directly at [redacted]

Respectfully Submitted,

Jonathan Harger
Government Advocacy Specialist

RESOLUTION OF THE ADAMS COUNTY COMMISSION

April 14, 2014

Whereas, the FAA has put forward a proposed expansion to the Powder River Military Operation Area that would include a substantial portion of the State of North Dakota, including the County of Adams;

Whereas, the proposed expansion would have an effect in Adams County and other surrounding counties that are adverse not only to the operation of air ambulance service, charter and general aviation, in and through Adams County, as well as an adverse effect to livestock and farming operations along with general quality of life; **LU-1 SA-19 SO-4 SO-5**

Therefore, It is hereby resolved that the Adams County Commission resists and urges the FAA to deny the request for the expansion of Powder River Military Operation Area in to the State of North Dakota and specifically over Adams County, North Dakota. **GE-2**

Essential Air Service Task Force [redacted]

April 28, 2014

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth TX 76137

Dear Manager:

The Montana Essential Air Service (EAS) Task Force consists of representatives from Montana's five eastern essential air service communities located in; Sidney, Glendive, Glasgow, Wolf Point and Havre. As you know, EAS communities receive scheduled air service under contract between the US Department of Transportation and an interested air carrier. The current air carrier provides direct service from each community to Billings. Under previous EAS contracts the US Department of Transportation chose a carrier that provided service to Denver, CO. These contracts are historically for a two-year period and given the history of the service, the potential exists for a future air carrier to be selected and provide service to Denver.

If this occurs, these routes would be impacted as direct routes to Denver transition through the proposed MOA. Any disruption in air service to these communities is unacceptable. These scheduled flights are, in most cases, the only form of public transportation available. Essential Air Service plays a key role in local communities by attracting and retaining businesses that depend on commercial air service and in health care by enabling our citizens to easily access sophisticated healthcare that is often absent in rural communities. AM-5

Other concerns with the proposal include: the impact to Montana's six public-use airports and private airstrips that underlay this expansion; the negative economic impact to these airports and communities; safety – there is no method to provide safe separation of military and civilian aircraft; lack of communication and radar availability; and the large proposed expansion and times of use appear excessive and unsupported. SO-5 AM-3

For these reasons, the task force opposes the expansion of the Powder River Training Complex. Adding additional time and expense to any air carrier or general aviation operator is not acceptable. In these volatile economic times and current state of the aviation industry, I urge you to reject the proposal, adopt the "no action alternative," and not interrupt commercial or general aviation activity in southeast Montana.

The task force values and appreciates our United States military forces. We thank you for your service to this great country.

Sincerely,

John Rabenberg

RE: PRTC Expansion

FAA Personnel:

I am sure that by now you have received several comments on the PRTC expansion encompassing parts of North and South Dakota, Wyoming, and Montana. I would like to add my name to the list of "dissenters" who do not want this expansion to happen! In my opinion, this PRTC expansion is unjustified, senseless, wasteful, and could cause several problems for general aviation underlying the proposed expansion, and also livestock producers and residents in general. **GE-2**

Some of the concerns of the locals relate to the ability of the air ambulance to fly into the MOA while it would be active. Our rural areas depend greatly on this service. Another concern relates to the safety of general aviation aircraft flying VFR into the active MOA. Perhaps ALL aircraft flying in this proposed expansion should be equipped with ADS-B In and Out avionics? **SA-19 SA-1 SA-7**

Other concerns relate to business jets frequenting the local municipal airports, due to a very active oil producing region. If these small business jets are flying in from Oklahoma or Texas, they would surely be in the required IFR flight range above 18,000 feet MSL. How would they be able to fly into the PRTC if it is active? **SO-10 AM-21**

The local FBO/Baker Air Service located in Baker, Montana flies an extensive pipeline and oilfield inspection program several times per week. Their concern is not only safety related, but also the ability for their pilots to initiate a GPS approach to the BHK airport due to deteriorating weather conditions. Would this be allowed in an active MOA? **SO-17 SA-7**

Livestock producers in the region have expressed concerns regarding their animals getting "spooked" from the noise of the low flying military jets. Other livestock producers have stated the noise could also disrupt the breeding and conception ability of their cattle and other livestock. **BI-2 BI-4**

Now, I don't want to ramble on and make this letter of comment longer than necessary. Being a private, VFR rated pilot myself, I supposed I would be concerned for safety reasons if I was flying my airplane on a pleasure flight in an active MOA. I have made several flights in the present PRTC MOA without any problems, though. We, as pilots, are responsible to "see and avoid", are we not? **AM-20 AM-21 SA-25**

Some of the concerns mentioned above are legitimate, although some are possibilities, OR could happen, OR might happen. Who knows? I recall the saying "Hope for the best, but prepare for the worst". With that in mind, if the FAA does consider approving the expansion of the PRTC MOA, I would like to see a "trial run", or "testing period" to see what problems might occur. Have some concerned ranchers confine a large group of cattle in a corral or next to a barbed wire fence, and have a B-1 bomber fly over the cattle at 500 feet AGL at their normal speed. If the cattle do get "spooked", that is indeed a concern. Have one of the local hospitals schedule a medical flight from either Billings, MT or Bismarck, ND into any local airport within the PRTC expansion while it would be active. This would be a good way of detecting any time-related problems to get that air ambulance where it is needed, rather than wait to see if a problem would arise after the "ink has dried" on the approval. **GE-10 BI-2 BI-4 GE-10**

38

In closing, I am sure that none of the Senators or Representatives from Montana approve of this expansion. It doesn't seem right that with all the politics involved with this PRTC expansion, only a handful of people could disrupt the lives of thousands by giving consent for this training area to expand! Maybe the residents of the lands underlying the expansion should be given a chance to "vote" if they do or don't approve. Senator John Thune (South Dakota) appears to be a large supporter of the expansion. Because he resides in and represents South Dakota, not Montana, or Wyoming, or North Dakota, he should consider expanding the training area into eastern South Dakota. They have a lot of farm ground and fewer livestock! **PN-2**

I could go on and on about the negative aspects of this expansion, but I am sure you already have an "earful". I just wanted to say "I hope it doesn't happen". But if it does happen, I don't plan to quit flying my Cessna. Other pilots have stated they won't fly into Baker Municipal when there is an active MOA in force. I suppose they will also have to quit flying into the higher traffic airports like Dickinson and Williston, North Dakota, and maybe Gillette, Wyoming. I don't know if any military training jet aircraft flying over my farming and ranching operation would be troublesome or cause a financial problem, BUT, I do hope a possible expansion would not be financially burdensome for the FBO operators it could affect! **GE-2** **SO-7** **SO-8**

With Regards,

Jerry Lang

Airspace Study 14- AGL- 06NR- Powder River Training Areas

From: Concerned mechanic and pilot, SW North Dakota

I am an aircraft mechanic , also a pilot in Bowman, N. D. & very concerned about the proposed Powder River Training Areas. As you may know, western North Dakota has gone through a great change, with the oil activities, associated with the Bakken, Three Forks, and Williston formations. New high paying jobs are increasing, populations climbing, air traffic in double digit increases, and many airports upgrading and expanding to meet the needs of these energy companies. In fact, our local airport is moving to accommodate this increased need. Now we may be faced with many altitude, navigation, operational restrictions associated with the proposed Powder River expanded areas!!

In our view, we gain nothing (no fuel sales, maintenance income, hangar rent, no income to hotels, restaurants,dealerships, etc.), but we are stuck with the proposed low altitude (500' AGL), navigation, gap, and operational restrictions?? Not to mention flares (fire potential), chaff (surface water, livestock affect), low flying fast aircraft (safety issue) and noise? I feel the areas will deter aviation business (who wants to mess with restrictions), and move our income potential to other airports outside the MOA???

SO-24

Airspace Study 14-AGL-06NR
Kent M. Wheeler
Department Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Mr. Wheeler,

It has come to my attention that you are proposing to take control of half of the airspace I am so fond of. It is my understanding that the Powder River Airspace will quadruple in size and become the largest MOA in the country. Although these three states involved do not have a high voter density, I'd like to make you aware that this is not quite a desert. Your airspace is covering many vibrant communities. At a minimum, I'd hope you would consider leaving us the surface airspace below 6000' where ever possible so we can continue to function. **GE-2**

In addition to my understanding that the MOA covers 3 states, it also covers 3 ATC's. ATCs that are not able to provide service to this area at low altitude. As only we know, they have difficulty dealing with each other. If this project goes through I think an ATC should accompany it to make the air space safe at the altitudes below 8000' where current ATC services are not readily available. While this request may be bold, it is not as bold as your proposed MOA. **AM-3**

The next issue is avoidance of aircraft. I don't know if you have been passed in a Cessna 172 by a fighter at nearly 600 knots but I have. I didn't see him coming, didn't see him leaving, but I did see him streak by with a closure rate of 700 knots. Had I not been warned, I would not have seen anything. At a minimum you might consider giving us ADS-B support for the taking of our public airspace. **AM-8 SA-1**

We also need an updated mechanism to determine if these MOA's are hot. In the world of text messages and instant access to the web we need a method to check out our access to these areas instantaneously. If you might consider this I'd also ask that you contract AOPA or EAA or some such organization that is competent in these processes to do the work. Having logged on to your websites it is evident you have a lot to learn in regards to user interfaces, ease of access, etc. **AM-12**

Many of us make a living in aviation and I see a negative impact on this. This could be remedied by raising the floor of the airspace and if that is not possible I's suggest a deserted location to have low altitude airspace available. **PN-2**

Being in the medical field I have concerns about medical access to these areas. Clinics need to be staffed and patients need to be transported. We already have issues in these regards which include airspace and weather. I'd ask you not to add to that burden. **SA-19 SO-5**

Thanks for your time.

Bob

Robert Roswick

Subject: Powder River MOA Expansion

To whom it may concern:

My letter is to express a few of the concerns I have about the proposed expansion of the MOA.

I am a pilot and have flown this airspace for 45 years. In this time I have had the discomfort of facing military aircraft and having to use evasive actions to avoid midair contact. This would not have been good for either one of the aircraft involved. If this expansion happens it will probably be the end of my flying career, just is not worth the risk. **SA-1**

This comment is also the feelings of many of the private pilots that I have visited with. This then creates a problem with our local economy, less aircraft, less personnel to handle the aircraft, less taxes paid, less salaries paid, and the list only gets bigger when we look at the big picture. **SO-5**

Another huge hit for land owners is what does this do to their land values? **SO-1**

This part of our country has many families who have bought ranches and farms in this area, the big reason being is the quiet and solitude that we are fortunate have and very much want to have it remain as it is today. **SO-4**

Our family has been here for 100 years. We have practiced good management of the land and its resources. We have also been very concerned with how the wild game animals are taken care of. We provide and promote game friendly environments. We also plan to see more habitats for endangered species on our land. I would like to know if anyone can tell me how the noise environment that will come with this MOA is going to affect our plan to provide for endangered species and animals that are already here? An answer would be much appreciated and expected. **BI-3** **BI-8**

SAFETY ISSUES:The increased airspace use and big numbers of aircraft operating is going to be a problem. From where we live I have personally witnessed the smoke columns from explosions of two B-1 bombers that have crashed. It is a given that this kind of wrecks and explosions will happen again. The only question being is when and where is it going to be? In someone's home, or maybe in the middle of one of the many small towns that are in this proposed area, we can only hope it does not happen but we can well bet that the chance of this happening is very real. **SA-1** **SA-20**

42

EXTENDED TIME FRAME PLAN:
There is one matter that never seems to come to lite in this airspace grab and its future plan.
Nowhere has it been provided for anyone to know what is the long term goal with this expansion.
5 year?
10 year?
15 year?
We all can be assured that the Airforce has goals and long term usage plans for the huge airspace that they are wanting to burden so many people with. I believe that there are so many plans with this proposal that the average person cannot comprehend and would be shocked to know about.

PN-3

Lastly I feel infringed upon! Raise havoc with our way of life, financially damage businesses in the area covered. And the list gets very long.

LU-1
SO-4
SO-1

My only hope and concern is that before this is implemented that we have someone involved who has some of the good old "COMMON SENSE" and takes a hard look at many of the issues that are being presented to you.

Sincerely,
John Tronstad

John Tronstad

Airspace Study 14-AGL-06NR
Kent M. Wheeler
Department Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Mr. Wheeler,

As a pilot based in the Bismarck, North Dakota area, I am opposed to the expansion of the Powder River MOA. I frequently fly through the proposed area and would be inconvenienced with this expansion. **GE-2** **SO-8**

This proposed expansion would cover about 28,000 square miles, expanding the present Powder River MOA by 4 times and be the largest terrestrial training airspace in the continental U.S. This will require other pilots and me to fly extra miles, incurring extra expense and loss of time to accommodate the Air Force. This proposal is for 240 days per year, so if approved, the odds are strong that I will be forced to avoid the area on a regular basis. **SO-8**

In the proposal, there is a comment under the heading "Miscellaneous"-"No restrictions will be imposed on nonparticipating Visual Flight Rules (VFR) aircraft." While there may be no restrictions, it certainly would not be safe to operate within the MOA without some type of radar guidance to see and avoid. It can be difficult spotting aircraft that do not exceed 100 knots, much less military aircraft that are capable of supersonic flight that may be at 500 feet to avoid detection in the practice area. **SA-1** **SA-7**

I believe I understand the need for training, but it would seem the travel to Nevada referred to in the proposal would be a time for pilots and crews to practice evasion tactics as they would if they were on a real bombing mission. **PN-2**

Fort Worth, TX 76137

Dear Sir or Madame:

I am writing to you in regards to the expanded fly zone here in the western Dakotas and eastern Montana. While I am aware of the Air Force's need to train for national security purposes, I have been unable to get much information about the implementation procedures that could impact the local pilots. — GE-9

As you know, this is an area where local pilots/ranchers fly frequently to protect their livestock against predators. The local pilots have safety concerns and feel these concerns are not being taken into consideration at the administrative level. If unsuspecting pilots are caught up in the wake of the fighter jets' paths, the results could be deadly. If the expanded fly zone is approved, will the local pilots be advised of the training schedule so they are able to avoid coming into contact with Air Force jets? Will the Air Force be diligent about adhering to the schedule and advising the local pilots of any changes made to the schedule? These pilots have every right to fly and protect their livelihood, and there is absolutely no reason for them to be endangered or killed. However, at this point, they feel they have no voice (what the government wants the government gets). — SA-1, SA-7, AM-12, SA-3, AM-20, GE-14

PN-3, SO-14 — Additionally, it has been reported that expanding the fly zone will save the Air Force over $20,000,000. This seems to be a half-truth at best. The money may be saved, but it will not be returned to the taxpayer. It will simply be spent on something else. — SA-25, SO-5

With the information I have at this point and without assurances by the Air Force that our local pilots are not at risk, we can only say **no** to the proposed expanded fly zone. — SO-11, GE-2

Sincerely,

William M. Brindley
Sarah Brindley

UNITED ENERGY
CORPORATION

April 15, 2014

Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth, TX 76137

Attention: Manager, Operations Support Group, ATP Central Service Center, AJV-C2

I have twice now been briefed on the proposed expansion of the Powder River MOA. We were last night shown the large area that is being proposed. Conceptually the area being taken is massive and is an overreach/overstretch. GE-3

United Energy Corporation and its affiliates use this airspace in western North Dakota regularly in the five planes we operate and if the proposed space is taken we will have reduced use of it causing us delays and additional costs reaching our destination. We are oil and gas producers and marketers of crude oil and natural gas. We have three single engine planes and two jets a Challenger 300 and a Citation Jet CJ-4. We are actively involved in the Bakken Shale Oil Play in Western North Dakota and realize the proposed North Dakota MOA airspace will severely hamper north south air traffic heading to the Bakken from points south. This is not only our planes but many others as well. . Huge volumes of traffic from places like Denver-Dallas-Tulsa-Oklahoma City-Houston and other southern points are going into places like Watford City-Dickinson-Stanley-Tioga, Williston and Bowman, North Dakota. Also Sidney-Plentywood- Baker and Glendive, Montana will be adversely impacted as well if this proposal is enacted. This proposed area would severely impact this air travel. The Bakken is the largest oil play in world and this space take blocks air transportation traveling to and from the south. It will be a real problem for the oil and gas industry which is already stressed to the limits with too much going on in to small of a space. SO-17 AM-5 AM-6

My second point is that in this part of North Dakota I often operate our smaller planes at lower altitudes VFR. The radar coverage there is minimal at lower elevations and it is not set up for prudent oversight of the space for safety purposes. AM-3

My recommendation is to eliminate the North Dakota part of the take completely.

Dear Sir/ Madam:

This letter is in reference to the Air Force's proposal to expand the Powder River Basin airspace training area. As a physician long interested in Indian welfare and as a Montana resident, I strongly oppose extending low and medium level training flights over the entire Northern Cheyenne and most of the adjacent Crow Indian Reservations. My step-son is an Air Force officer and pilot. We have visited him on base and have experienced mid- and low level practice runs. The noise is ear-shattering, particularly with low runs at the 500 ft. level.

There are elderly, children, and livestock scattered throughout this area, as well as sometimes religious ceremonies. Their air quality has been Class I. It is cruel and inhuman, in my opinion, to subject these quiet places to training noise, air pollution, and the risk of an air crash. These people already have enough problems and deserve, at least, the sanctity of peace and quiet.

Thank you,

Richard Belgrad, M.D.

I am a pilot, landowner and livestock owner in western South Dakota in the proposed Powder River Training expansion area. We currently have all the stress we need from weather, markets and government regulations and we do not need more infringement upon our safety and property from concentrated extreme military operations.

The social and economic cultures of this area have been and will be dependent upon the freedoms to navigate and operate without undue stresses from outside forces. Your proposal will subject the occupants and businesses of this area to new hardships which may be the demise of private industry and occupation as has become the norm on most military training facilities.

Many of the counties within the proposed area have comprehensive social and economic plans for the future preservation of their cultures and this proposal will be contradictory to their efforts. Do you believe sacrificing the culture along with their toils to feed a nation is worth expanding the playground for our military?

SO-22

Each year our federal government acquires more land so my suggestion would be to make use of some of the remote federal holdings with minimal impact upon our citizens.

Subject: Powder River Training area expansion

Dear Sir/Madam,

On behalf of the Bowman County Development Corporation, I am writing to voice my concerns about the Powder River Training Complex proposed by the US Air Force that would cover Bowman County, North Dakota. Our community and city would be directly under the proposed area number three. Energy, Bakken and Three Forks oil formations, is big business in our community and flight operations associated with these energy companies would be directly affected by the proposed training area altitude and navigation restrictions. A new airport is being built to accommodate the larger turbine aircraft, flying for these energy companies.

AM-1

AM-20
AM-21
SO-8
SO-17
SA-23

Our recommendation if the Powder River training complex is going to be expanded would be to raise the floor for the flights from 500ft to 8,000ft. Another recommendation is to limit the 500' AGL floor limit to 1 or 2 days/week instead of the proposed 5 days/week. Our final recommendation is to provide a telephone contact to military training headquarters for instant updates for those flying near the areas. These items would greatly reduce the impact of our operations, and hope to be considered by your office. If you have any questions, please contac me a[redacted]Thank you.

54

Greetings Roger- as an Air Force vet, retired Delta Airlines Pilot, and small aircraft owner for 35 years, I have deep concerns about the newly proposed Powder River training complex. I 'm chairman of our local airport board, and in the process of relocating to a new airport with 5700 x 75' concrete runway. This project is in response to OIL activity in our area (bakken, three forks, and williston formations. The 500' above ground restriction is going to kill everything we are working for! We will be directly under proposed area 3 (500'agl to 18000'). I feel we can handle the flares & chaff issues, which farmers, ranchers, rural fire depts, & wildlife managers are against. We can also live with the large force exercises 10 days a year, but have great concerns about 500'AGL. It affects everything from corporate, pleasure, flying clubs, pilot training, medivac, and crop dusters, not to mention IFR inbound & outbound traffic. I wonder how much my farm would be devalued if I ever decide to sell?? Our recommendations are few & easy- If Ellsworth AFB wants a bigger area, put it in So.Dakota. If Minot AFB wants a closer area, go east to 2 moa's already in place but not being used. Raise the floor to 8000' (which would solve 90% of issues over night). Use the 500' restriction 1 day/ week instead of 5 days. Thank you for your attention & hope the " powers to be " will consider our recommendations.

Sincerely, Rodney Schaaf- Bowman

Dear Folks,

This letter is in regards to the proposed addition to the Powder River MOA in S.E. MT. The Recreational Aviation Foundation which is composed of nearly 6000 members from across the U.S., as well as 12 foreign countries stands in opposition to the expansion of this airspace into the state of MT. GE-2

Expanding the MOA will put a heavy burden on the general aviation population in this part of the state. MT is a state that relies heavily on general aviation and hindering the ability to easily traverse the state, including the airspace in question, is not feasible. The state of MT looks to be a good partner with the military, but we feel our state has given its share and more. GE-3, AM-5, SO-5, SO-7, PN-2

We strongly urge you to look elsewhere for this desired airspace.

Thank you,

John McKenna, President
Recreational Aviation Foundation

The RAF Mission:
"Keeping the legacy of recreational aviation strong by preserving, maintaining and creating public use recreational and backcountry airstrips nationwide."

Subject: Powder River training area expansion

From: Talbot township, North Dakota

We the undersigned township supervisors are greatly concerned about the Powder River training area proposed expansion. We are in OIL country, Bakken , Three Forks, and Williston formations, and would be directly under Area 3. Flight operations associated with these energy companies would be directly affected by the proposed altitude and navigation restrictions. **SO-17 AM-6**

We hope some of the following recommendation could be incorporated into the training areas.

1- Raise the floor limit (500' AGL to 8000'MSL) **DO-3 PN-4**

2- Limit the 500' AGL restriction to 2 days/ week instead of 5 days/ week

3- Telephone direct line to a training office to get updates to area use by pilots **AM-3**

Thank you for your attention.

Sincerely: Talbot Township Supervisors

RE: Powder River MOA Proposed Expansion

As a commercial pilot, both fixed-wing and helicopter, born and raised in this region and having lived here my entire life, I am deeply concerned about the future of General Aviation (GA) as a whole, both professionally and recreationally. AM-6

Setting the cost of flight training, insurance, and fuel prices aside, General Aviation, through dozens of unwarranted product liability lawsuits that brought the aircraft manufacturing industry to its knees in the mid-1980's, was the first nail in the coffin and the industry has yet to recover. Couple that to the average age of the GA fleet—40 years and counting—and we are now witnesses to more intense Airworthiness Directives (ADs) that will almost certainly guarantee the grounding of certain aircraft models in the distant future, another nail.

Before September 11, 2001, our primary regulating body was the FAA. Today, in addition to the FAA, we have the DHS as well as the EPA systematically pounding multiple nails in the GA coffin through unwarranted regulations that is creating a very hostile environment towards an industry that has long been the brunt of so much unnecessary abuse through excess and error.

The proposed Powder River MOA expansion, if approved, will pound yet another nail to an already extremely fragile GA economy, once again, both professionally and recreationally. I suspect it might even instill fear in some of the less experienced pilots who will avoid the entire MOA training complex like the plague. SO-5 SO-6 SA-7

AM-9 My biggest fear regarding this possible takeover is future blocks of the airspace turning into Restricted Areas. It may sound far-fetched, but I never thought it could come to this. SO-26

If we give it up, we will *never* get it back.

Yours truly,

Craig Stebbins

RE: Proposed Powder River Complex Expansion

Dear Sir or Mam,

The Pennington County Board of Commissioners fully supports the proposed Powder River Training Complex to meet the airspace training needs of today's Air Force. This expansion is critical for our nation's security as well as the safety of our military men and women. Finalizing the expansion of the current training airspace is vital to maintaining our military readiness and is important to the state of South Dakota and the County of Pennington alike. GE-1

The expansion, initially proposed in 2008, is intended to allow military aircrews to plan and conduct realistic training scenarios directly applicable to current operations and potential conflicts in the future. To be able to train realistically, more space is needed to practice the kinds of engagements our Airmen expect to see in combat. This will increase the likelihood of successfully accomplishing the combat missions. PN-1

As the final step, we sincerely appreciate the FAA seeking public comment before making the final decision. We support the Powder River Training Complex and respectfully request the FAA expedite its approval.

Sincerely,
The Pennington County Board of Commissioners

RE: Powder River Training Complex 2014

Dear Sirs:

I am writing in support of the Powder River Training Complex; as a student at Powder River County District High School in the early 1940's, B-17 flew over our school. We were very proud of them – thrilled to see them. What little discomfort they would cause is very little compared to the value the training would be to our Air Force.

I am a part of a military family and am very proud of what has been accomplished over the years by all of our armed forces.

Again, I am very much in favor of the Powder River Training Complex.

GE-1

Yours truly, Milton L Amsden

Subject: Airspace Study 14-AGL-06NR

Dear Mr. Wheeler,

The North Dakota Aviation Council is a member group comprised of the:

- Airport Association of North Dakota
- North Dakota Agricultural Aviation Association
- North Dakota Association of Aviation Museums
- North Dakota Business Aviation Association
- North Dakota Experimental Aircraft Association
- North Dakota Flying Farmers
- North Dakota Pilots Association
- North Dakota Professional Aviation Mechanics Association

The membership of the North Dakota Aviation Council is comprised of the chairmen and vice-chairmen of each represented group. As a council, therefore representing all these entities, we request a 90-day extension to the comment period slated to close on April 3, 2014 for the Proposed Establishment of the Powder River Training Complex as referenced in the above mentioned airspace study.

We feel comments to this proposal should be allowed to be submitted via email and that the proposal should be available on the FAA website.

We feel the physical size of this proposal makes it necessary for an extension in time of the comment period in order for affected users to better understand the complexity of the proposal.

We are hopeful that there will be an extension of the comment period for 90 days to allow for a more concise public review which will allow all of the members of the aviation associations and the public the ability to provide more relevant comments to this huge proposal.

Please respond to this request for an extension at least a week prior to the deadline and Thank You!

Respectfully,

Rod Brekken, Chairman
North Dakota Aviation Council

RE: Expansion of Powder River MOA

With respect to Airspace Study 14-AGL-06NR, concerning the proposed expansion of the existing Powder River MOA, the "Fact Sheet" indicates the likelihood of "significant negative impact to Montana's economy (including oil exploration in the area)".

TransCanada has proposed to construct and operate its "Keystone XL Pipeline" system through a portion of the proposed area; specifically the area identified at "PR2". We would like to better understand the anticipated impacts of the proposed MOA expansion on the construction and operation of our proposed oil pipeline. Can you provide or identify the location of an impact study associated with the Powder River MOA expansion?

Re: Airspace Study 14-AGL-06NR

Dear Manager:

The proposed expansion of the Powder River MOA is unacceptable from a safety standpoint. Use of many million dollars worth of general aviation airports would be limited by this MOA. There is no corridor being proposed which would give civilian pilots a safe route when the proposed MOA is active.

There should be specific airways open to each of the FAA funded airports at ALL times. Supersonic flight should not be allowed below 18,000 feet in any MOA where communities are located and ALL supersonic flight should be made aware of to the Salt Lake and Denver Centers.

PN-2

The "Hays" MOA in Northeastern Montana could be an alternative for the proposed Powder River MOA with less than 30 additional minutes flight. This would impact far fewer communities and airports. If 30 additional minutes is too far maybe the Air Force should send aircraft to the decommissioned Glasgow Air Base for temporary duty and training. This old base is underutilized and could be re-opened with some of the savings touted by the Powder River MOA.

Dear Manager:

The Aviation Organizations of Montana oppose the expansion of the Powder River MOA. There are approximately 1500 citizens represented by the Aviation Organizations of Montana. The Aviation Organizations of Montana (hereinafter AOM) includes the following: Montana Experimental Aircraft Assn, Montana Aerial Applicators Assn, Montana Antique Airplane Assn, Montana Aviation Trades Assn, Montana Flying Farmers, the Montana 99s, Montana Seaplane Assn, Montana Community Airport Assn, Montana Pilots' Assn, Montana Aircraft Owners and Pilots Assn, and the Montana Airport Managers Assn.

First, our opposition to this proposal is based on safety. Access for emergency medical flights is not set out in the proposal. Given the vastness of Montana and the area this proposed MOA would cover, this presents a huge problem. No conscientious flight instructor would send a student pilot on a flight when this area is active. **SA-18 SA-19 SO-5**

Second, while this proposed MOA is active the air space is available to civilian pilots; however, there is no radar or method of communication for those civilian pilots. Montana is the fourth largest state in the nation and many pilots travel for medical, business, family, and educational reasons. These pilots fly because it is the most efficient means of traveling long distances. **AM-3 SA-4**

Third, this proposed MOA impacts airport operations in and around Ashland, Baker, Broadus, Colstrip, Hardin and 40 plus private airstrips in Montana. This area is bigger than some Eastern States. **AM-4 AM-21 SO-21**

GE-3 Fourth, this proposed MOA limits Montana citizens ability to check dams, pipelines or irrigation systems, livestock, crops, fire fighting, and road conditions (this list could go on and on). In general, this proposed MOA would impose unfair economic and freedom restrictions. **SA-7 SO-11**

Sincerely,

Marilyn Hollister

RE: AIRSPACE STUDY 14-AGL-6NR
POWDER RIVER PROPOSED TRAINING AREAS

Dear Manager of Operations Support Group,

As the President of the City Commission of Bowman, North Dakota, I strive to maintain economic growth, improve community infrastructure, and improve the wellbeing of our citizens. As you may know, our community has undergone great changes associated with Oil, (Bakken, Three Forks, Tyler, and Williston Basin formations.) New high paying jobs are increasing, populations growing, new home sales, and new businesses starting up. In fact, our local airport is moving to accommodate this increased need and service!

To me, the many restrictions associated with the proposed Powder River training areas, 500 feet altitude, navigation, gaps, and operational issues, will deter economic growth, which will have a great impact on our city and community. Please consider some recommendations:

1 – Use existing areas already in place
2 – Make our area a "high training area" with regard to altitude
3 – Raise the area floor to 8,000', to accommodate low air traffic
4 – If you need the 500'restriction, use it 1 day a week

PN-2
PN-4

Thank you for your time and consideration.

Sincerely,

CITY OF BOWMAN

Lyn James

Airspace Study 14- AGL- 06NR- Powder River Training Areas

From: Concerned Pilot, SW North Dakota

I am a private pilot, in south west No. Dakota and very concerned about the proposed Powder River Training Areas. As you may know, western North Dakota has gone through a great change, with the oil activities, associated with the Bakken, Three Forks, and Williston formations. New high paying jobs are increasing, populations climbing, air traffic in double digit increases, and many airports upgrading and expanding to meet the needs of these energy companies. In fact, our local airport is moving to accommodate this increased need. Now we may be faced with many altitude, navigation, operational restrictions associated with the proposed Powder River expanded areas!! In our view, we gain nothing (no fuel sales, maintenance income, hangar rent, no income to hotels, restaurants,dealerships, etc.), but we are stuck with the proposed low altitude (500' AGL), navigation, gap, and operational restrictions?? Not to mention flares (fire potential), chaff (surface water, livestock affect), low flying fast aircraft (safety issue) and noise? We feel the areas will deter aviation business (who wants to mess with restrictions), and move our income potential to other airports outside the MOA???

If South Dakota (Ellsworth AFB) wants a larger area, move it to South Dakota!! If North Dakota (Minot AFB) wants an area, go east to the Tiger and Devils Lake MOAs already in place!! Seems like Ellsworth and Minot get the income

82

and we in southwest North Dakota get nothing??

I support our men and women in uniform and support training, but there seems to be no compromise to benefit our airport and community??

A few recommendations, I believe, would greatly reduce the training area impacts-

1- area relocation , or make area # 3 a " high area " — AM-6

2- raise the area (3) floor to something higher than 500' AGL, small aircraft could go under, large aircraft could go over (FL 180) — SO-28

3-have a direct telephone line to a military training office to have instant updates for pilots, flying near the areas (other than Flight Service Stations) — PN-4, AM-3

Thank you for your consideration.

Concerned Pilot

Fort Worth, TX 76137

Ref: Airspace Study 14-AGL-06NR

Weather Modification, Inc. is the primary contractor providing specially-modified aircraft and pilots for the North Dakota Atmospheric Resource Board (NDARB) cloud seeding project each summer. The ND Cloud Modification Project (NDCMP) runs from June 1 through September 1 each year, with options to extend through the end of September if growing conditions and forecast weather merit. This project is sponsored and primarily financed by the individual counties that make up the two current target areas of the NDCMP, with the State of North Dakota providing some matching funds, project meteorologists, weather radar support, and overall project management through the ARB. The two project target areas (Districts 1 and 2) together cover 10,425 square miles – nearly 15% of the State's total area.

District 1 is comprised of Bowman and portions of Slope Counties with buffer zones on the northern and eastern sides, in the southwestern corner of ND. This area is completely overlaid by the proposed PR-3 Low and High MOA's and the GAP B and C MOA's. Airborne cloud seeding activities have been operational in this District 1 target area since 1961. The objective of the program is to provide relief from damaging hailstorms while also producing enhanced rainfall amounts during the growing season.

WMI's contract with the ARB to provide aircraft and pilot services for District 1 cost the taxpayers of Bowman and Slope counties about $161,000 for the recent 2013 summer season. As an indication of the value received for this expenditure, a 2009 study commissioned by the ARB showed that this program produces from **98 to 138-1 gross economic impact** resulting from the increased agricultural production that the program allows. This is a huge impact, $15-20 Million, for the citizens of southwestern ND.

As part of our contract with the ARB, WMI bases two cloud seeding aircraft in Bowman, ND to serve the District 1 target area. These aircraft, sometimes supplemented by some of the six other WMI aircraft from the northern District 2 area, operate around 130 flight hours per season depending upon weather conditions. Operations are conducted 24/7, with the crews on call

[redacted]

87

WEATHER MODIFICATION
INCORPORATED

during the entire season ready for immediate launch. Flights generally last around 2 hours, with the entire flight track normally contained within the District 1 area unless a diversion is required.

Figure 1 (below) shows a map of District 1 with all 2010 operational flight tracks plotted; blue is District boundaries and buffer zone areas, black is flight tracks while not seeding, green / yellow / red are flight tracks during seeding activities.

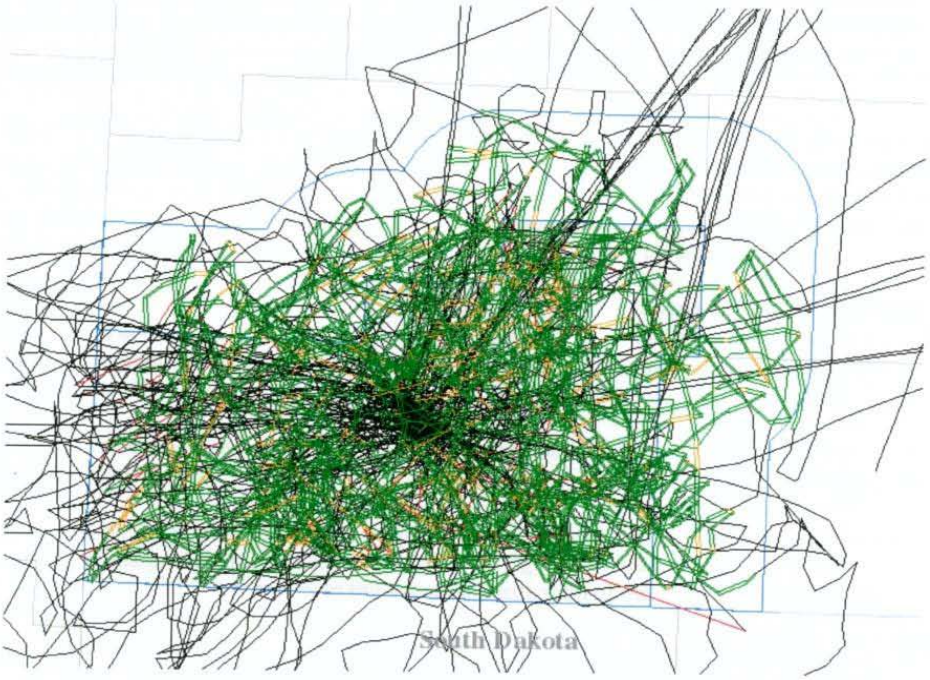

Fig. 1: Summer 2010 NDCMP District 1 cumulative flight tracks

This graphic shows the unpredictable routes that the seeding aircraft fly during operations, as their flight paths are dictated by the thunderstorms around which they must operate. While seeding takes place only to target storm cells that will impact the District, the aircraft must also work around the storms to gain access to the proper areas of the storm cells for effective seeding. Safe operations around severe and cumuliform weather cells also require that the aircraft crews be able to escape the storm if lowering visibility or other storm growth were to

[redacted]

87

WEATHER MODIFICATION
INCORPORATED

trap them, precluding a visual return to their base at Bowman. Also note that approximately 30-40% of these flights take place during nighttime hours.

While most of the seeding flights are conducted near the thunderstorm cloud bases under visual flight conditions (VFR), about 15% of District 1 seeding flights are conducted at "cloud top" (in and around the tops of the growing cumulus areas at altitudes between 15–23,000 ft) under instrument flight rules (IFR). And some flights that start as VFR operations become IFR flights when conditions deteriorate. This means that for effective and safe flight operations the WMI aircraft MUST be able to operate under IFR in this area, as well as the surrounding area if needed to skirt the severe weather.

"Cloud top" seeding flights dispense their seeding chemicals using ejectable flares, which can fall up to 3000' while burning for 40 seconds. Some topseeding flights will also utilize pellets of dry ice dropped from the aircraft. Seeding aircraft at cloud base use fixed "generators" mounted on the wingtips, which burn the chemical mixture to release a fine plume of seeding material. The base aircraft will also use flares, which are fixed to wing racks and burn in place.

Communications with ARTCC (Salt Lake Center, and to the east Minneapolis Center) are usually not possible at lower altitudes (generally below 8000' MSL) and must be facilitated using the FSS remote communication outlet at the Bowman airport, or by relay through passing higher-altitude aircraft nearby.

This raises several operational and safety issues that could be adversely impacted by the expanded MOA areas.

1. While the WMI seeding aircraft do mostly operate VFR, by necessity they do not fly a pre-planned route, speed, or altitudes. VFR flight plans are not filed as the route, altitude, duration, and even the eventual destination of the flight are all unknowns when the aircraft is launched. Where the storms go, so must go the airplanes. While the WMI aircraft are always coordinating with each other they are not going to fly predictable flight paths, which could increase collision hazards with military aircraft during MOA operations.

2. When the WMI aircraft are called to operate as IFR flights for certain mission parameters, they will need to be able to do so immediately. Thunderstorms do not occur at preplanned times, and this means that the WMI crews have little advance notice when they are called to fly. Even the best forecasting cannot accurately predict the exact onset and timing of thunderstorm formation or movements, and even though the WMI aircraft are guided by the NDCMP ground based weather radar at the Bowman airport this does not afford extra time at the start of storm formation. Therefore while

SO-28

[redacted]

87

WEATHER MODIFICATION
INCORPORATED

the original draft EIS mentioned coordination with Ellsworth AFB to "deconflict" the airspace, WMI aircraft would need that to happen very quickly. We simply are not in a position to plan ahead.

3. As already pointed out, when the weather conditions deteriorate making it unsafe to remain VFR, WMI aircraft will need to be able to "airfile" IFR flight plans and transition to those plans IMMEDIATELY. This is a safety of flight issue; to operate safely around severe weather means that all options must be available to the WMI aircraft crews. Since the only reason they will be flying around the thunderstorms is to protect crops and property for the taxpayers in the target area, they must be able to "stick with it" as long as possible before they must abandon the area. When the weather in the target area is clear, WMI aircraft will not be operating unless transiting between storms or bases.

SO-28

Simply stated, the WMI aircraft must be afforded every opportunity to operate in the area of the proposed PR-3 MOA without undue delays or prohibitions on IFR flights, and in a safe manner without added collision hazards while operating in an already potentially hazardous flight environment. Coordination with Ellsworth AFB would of course be welcome but "deconfliction" of the airspace cannot be delayed for any appreciable amount of time. Procedures, remote communications outlets, dedicated contacts, and operational protocols must be put in place that will allow these operations in a timely manner.

Weather Modification, Inc. has been safely operating in and around severe weather conditions around the globe with our aircraft since 1961 without an injury accident. We pride ourselves in providing a safe and reliable service to our customers, and those same customers – in this case, taxpaying citizens of the State of North Dakota - deserve the freedom to be protected from the hailstorms and drought that threaten their livelihoods.

Thank you for the opportunity to again provide comments regarding this matter.

Hans Ahlness
Vice President – Operations
Weather Modification, Inc.

RE: 14-AGL-06NR

Dear Mr. Wheeler;

The Baker Municipal Airport (KBHK) will be very negatively affected by the proposed expansion of the Powder River Military Operation Area. We are opposed to any such expansion and recommend the "No Action" proposal be accepted. There is not adequate justification for this massive expansion. Low level operations are not justified. Doctrine for Modern Warfare, as stated by the USAF in the Background section of this proposal, says that the weapons can be deployed from well beyond visual range with great precision. The USAF should fly to the un-occupied desert for these type of missions. It would create hazards to people and property if done over this area. — GE-2, AM-6, PN-2

We have spent close to $20 million in ADAP fund on this airport since 1988. In 2010, we extended & resurfaced our runway 13/31. New "state of the art" LED airport lighting was installed & the runway surface grooved. We are in the process of developing new VNAV approaches for both runways 13/31. It would be a shame to place the restrictions of this proposed MOA over this airport. We would probably lose our only FBO that has served this community for over 35 years continuously. IFR traffic would not be able to use our airport while the MOA is active, proposed 240 days/ yr. — AM-5, AM-21

We do not have ATC communications or radar below 8,000 to 10,000 MSL. This would severely limit transient operations at KBHK. This would result in loss of jobs and revenue to this energy rich area. I have enclosed documents for your review on how important this energy rich area is becoming. — AM-3

Citing data from 2007-2008 Montana Economic Impact of Airports Study, this MASSIVE expansion would jeopardize 95 jobs that generate over $1.5 million in payroll, $3.8 million in economic activity, in the communities that underlay this behemoth!! 39 airports and 285 aircraft will be very negatively impacted by this expansion. — AM-5

This proposal is in direct conflict with KBHK Airport, Airport Influence Area Zoning Regulations. These regulations were designed and implemented to protect this airport and its airspace. There are no provisions for IFR flights in/out of KBHK, using the new VNAV Instrument Approaches that are currently being developed for KBHK. 2000 AGL with 3 mile radius is not adequate for IFR operation, IAF's, intersections, etc. of the instrument approaches. How could flight school operate safely at this airport? — SO-26

88

Baker Municipal Airport Commission

[redacted]

The oil & gas industry is the largest employer in Fallon County. Currently, the State of Montana collects over $50 million in oil & gas production taxes in Fallon County, over $20 million returned locally. Denbury Resources is the largest oil producer in Montana. They currently pay millions in taxes to Fallon County! Denbury Resources is the #2 taxpayer in the State of Montana! Denbury currently uses KBHK on a continuous basis, sometimes with multiple operations daily. I have been advised that Denbury will no longer use Baker Municipal Airport if this airspace is expanded as proposed. They operate under FAR Part 135 and will not be able to comply with FAA Regulations to continue operations.

AM-5

Highland Partners operates a Cessna Citation XLS in this current airspace on almost daily basis. The cost of these operations will increase by $70,000 per year alone by implementing this airspace expansion. This expense is for just one of its aircraft. This group of companies own and operate four jets, used to service this area. The also contribute heavily to public taxes.

These are just two of many current operators that use this airport on an almost daily basis. We have over 5,000 operations annually at this airport. Typical flights are transition through this area between KCPR, KGCC, KISN, KDIK, KSDY, & KBPP. There will be many airspace conflicts and increased costs to general aviation.

KBHK is considering annual airshow performances. How would we even be able to have a simple airshow without the undue hardships associated with an active MOA. I am very proud of this small GA airport as it has served the area well. It has been well-maintained and expanded to meet current and the future needs of this area.

In 2008, Fallon County constructed and 8,000 square foot heated hangar for transient aircraft. We will construct another 12,000 square foot hangar this summer for local GA aircraft. We expect to be reimbursed for these cost as well as airport construction costs if this proposal goes forward, as we cannot operate this airport safely.

We will also have a new BLM SEAT "Fire Base" this summer, with up to 4 aircraft based here.

SO-10
SO-17

Baker's current population exceeds 2000 people and is rapidly growing. A 600 person "man camp" has already been constructed in Baker, MT and is ready for Keystone P/L construction when it goes. 2600+ people in one city alone under LFE's!!

Please, here these concerns and don't make KBHK go away!

Roger Meggers, Baker Municipal Airport Manager

RE: Airspace Study 14-AGL-06NR
(Powder River MOA Expansion)

Dear Sirs;

I am a pilot based out of Aberdeen, SD. I fly my plane off a grass strip on our farm and do almost all my flying to the west. I have a business in Lemmon SD and a daughter in Bozeman, Mt., with flying friends in Spearfish and Belle Fourche.
I fly low and slow, my plane is a bush plane with a seaplane prop and large tires. The 500' low altitude base would put military planes on a collision course with my normal cross country flying altitude of around 1000' AGL and when we are backcountry flying between friends ranches or remote strips we stay in that 100' to 500 ' AGL level.

I want to support our troops and I want them to have all the advantages possible but I notice large increases in the size and scope of MOA's. Case in point, is the expansion taking place in Alaska. The most disturbing things that directly affect my flying are the low level altitudes, (500') and the days and hours of use, (240 days in the Powder River 1-4)
Correct me if I am wrong but I cannot recall seeing MOA Areas being dissolved once they are established, so apparently, once established they remain.

AM-21
PN-4
PN-5

In conclusion, this expansion will adversely affect my access to flying areas, my current direct to method of cross-country travel and the altitudes that I presently utilize. More specifically the travel to and from my business, daughters home and friends Ranches will be affected.

AM-20
AM-21
SO-11
SO-13
SO-15
SO-20

I see that comments received before April 3rd will be considered before final action is taken and that the proposal may change in light of comments received.
I hope this is true.

Sincerely Yours

Tom Barber – Pilot and Airplane Owner.

April 23, 2014

Airspace Study 14-AGL-06NR
Kent M. Wheeler
Department Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Mr. Wheeler,

Our local EAA chapter EAA 1008 met on Saturday, April 19th. During our business meeting, a vote was taken, directing me as President of the chapter to draft and send a letter opposing the proposed Powder River expansion. Our chapter has 51 active members in the Bismarck-Mandan (North Dakota) area.

As a pilots based in the Bismarck, North Dakota area, we are opposed to the expansion of the Powder River MOA because of the impact it will have on the pilots in central and south west North Dakota.

1) The proposed area will pose a huge safety issue. The proposed area has limited radar coverage, which means that you are proposing we fly by "see and avoid" methods. We suggest "see and avoid" is impossible when we are talking about aircraft that fly at the speeds the aircraft for the proposed MOA will be flying at.

2) The proposed MOA also involves (3) three ATC's-Minneapolis, Denver and Salt Lake. Again, we believe this can quickly escalate into a safety issue. One ATC may feel radar coverage is adequate, then hand the flight to the next ATC that believes the radar is not adequate and expect the flight be conducted using reporting points for tracking because the radar coverage is inadequate.

AM-3

3) The EAA 1008 believes pilots need training-military, commercial and general aviation. However, this proposal will increase the costs for pilots in the Bismarck Mandan area. Pilots flying in the western portion of North Dakota will be expected to use the corridors to traverse the MOA, assuming it is a day which has not been NOTAMD as hot and may not be able to penetrate the area. It will make it near impossible to conduct pilot training for pilots located within that area. Ironic the local communities may well lose the ability to train pilots, because the military wants the area for training. And it will have a significant impact on both private pilots and companies (charter and businesses) that regularly conduct flights in the proposed area.

AM-21

4) Any flight that will travel to or from the Bismarck area (or flights to or from communities located within the proposed MOA) to the west-south west will be near impossible to plan, because there is not and apparently would not be a "calendar" that would show when a "Hot" NOTAM might be (proposed days of use) indicating the MOA was hot. How would a pilot in this area plan a trip that needs to pass through or into the MOA? Realistically, pilots from this area would have to plan to fly around the MOA, where it is possible. As an example, when I personally make a trip to Ft. Smith, Montana for a fly fishing excursion, if the current Powder River MOA is

AM-21

102

hot, it is such a minor deviation the deviation is not measureable in flight time. However, should this proposal be enacted, I don't feel flying to Ft. Smith is even an option, since I will not know if the area is flyable (MOA NOTAM'D as hot) or if I have to drive which is a significant time difference (driving vs. flying). Because of the difference in travel time, I would have to arrange to take additional time off from work. As second example is, if I were to conduct an "Angel Flight" (moving people in need to a medical facility, for example), it is considered a "compassion flight" which is non-emergency. The flight is not possible under the rules as I read them, since they are conducted under IFR rules, but are non-emergency

AM-21

5) There are members of the EAA 1008 club that also have financial interests that will be impacted. The businesses we are involved with are located within the proposed MOA. We use our aircraft to make the most of a day, not spend the time driving. As an example, if I were to drive to one of our stores located within the purposed MOA (Bowman, ND), I can figure more or less 2 ½ to maybe three hours. I can fly there in less than an hour. So, if this proposal passes, I lose a half of day of productivity. I am certain the other members can cite similar costs that will be incurred.

SO-7

6) Aside from the impact on the EAA 1008 members, this proposal will cripple the medical communities within the proposed area. Smaller communities depend on medical professionals being flown in and out to assist the personnel, particularly emergency room personnel. These flights are non-emergency so they would or could conflict with the MOA procedures. You are asking these communities to take a financial hit and give up local medical treatment in the name of improved military training efficiency.

SA-19

7) Realistically, what is being proposed would be similar to me asking you to drive outside the Dallas Ft Worth area each day to work (240 days, around, not through) because the Army wants the road to train drivers on, but the Army is not sure which days or which roads they will use until 24 hours before the use. Obviously the populations affected are different, but the impacts would be similar. You could use the road, but since the area has been designated as a MOA, which happens to be active, your insurance may not cover you and you would be responsible for avoiding a tank, etc. traveling within that area. Do you think this would affect the businesses and citizens within that area?

Finally, this proposed expansion would cover about 28,000 square miles, expanding the present Powder River MOA by 4 times and be the largest terrestrial training airspace in the continental U.S. This will require non-military pilots to fly extra miles, incurring extra expense and loss of time to accommodate the Air Force. This proposal is for 240 days per year, so if approved, the odds are strong that General Aviation pilots will be forced to avoid the area on a regular basis. EAA 1008 chapter is opposed to this proposal.

Powder River MOA Expansion

I am writing concerning the expansion of the Powder River MOA. I fully support our military, Ellsworth Air Force base and the need for proper training of our armed forces. However, the proposed expansion of the Powder River MOA, mostly into Montana airspace, provides no benefit to the State of Montana, its aviation industry or its citizens.

Data from the 2007-2008 Montana Economic Impact of Airports Study concludes that this massive expansion of the MOA will jeopardize 95 jobs that generate over $1.5 million in payroll and $3.8 million in economic activity, in the communities that reside under the proposed MOA. The proposed expansion will have a significant negative impact on Montana's economy, including oil exploration, ranching, fixed base operators and related businesses. SO-24

There is no method to provide safe separation of military and civilian aircraft. Sharing the airspace with high speed, low flying bombers and fighters with no communication or radar is a legitimate safety concern. The USAF "lights out" night operations currently approved for the Powder River MOA, there is no way for a civilian VFR aircraft to see and avoid a unlit military aircraft at night. Allowing speeds greater than mach 1 above 10,000' MSL is unsafe when you have VFR civil traffic in the same uncontrolled airspace. The approved use of chaff and flares for training may also affect livestock and increase the potential for wildfires. The proposed MOA may also negatively impact emergency medical transport flights that are vital to this area, ranchers from checking on equipment and livestock from the air, as well as pipeline patrols and wildlife management operations. SA-1 AM-7 BI-5 SA-7

Currently IFR traffic is not allowed into or above an active MOA, this would significantly hinder all aircraft operations. Flight training at all underlying airports and in fact the entire region would be hampered because no prudent instructor would allow their student to fly into an active area.

The Gap MOA's are supposed to provide for navigation between active MOA's, however with only 3 Gap MOA's any aircraft may have to significantly deviate from their course in order to utilize these Gaps. Requiring such deviations would increase costs to those operators, in addition during any Large Force Exercises the Gap MOA's would be unavailable to civilian aircraft. AM-20

I am all for aviation and I am one that would love to see a B1 bomber flying at 500 knots 500' above the ground. But this proposed expansion is not good for Montana, the people or the economy.

Sincerely,

Lucas Locke

RE: EXPANSION OF POWDER RIVER RANGE!!

TO WHOM AND EVERYONE CONNECTED WITH THIS PROPOSED MILITARY EXPANSION!!

The Draft EIS needs to hear and listen to those in this area who would be affected by such an expansion. We do not want low flying fighter planes and aircraft with all the noise they make flying over our ranchers and their cattle and oil workers of all capacities including drilling rigs. Not to mention even the rural roads with their traffic—more than once many have been frightened out of their wits by these low flying practice planes as it is without expanding it to cover more area and more frequency!! LU-2

Also it is of great concern for our airport traffic—not only the local flyers but also for the business professionals who fly in here with their personal jets. This would not be a safe environment for our air traffic. SA-1

There are a lot of places that are desolate and very sparsely populated. Wouldn't it be far better to choose a place of that vacant and useless terrain? PN-2

We certainly want to register our objection to this expansion being in our area!

Thank you for taking the time to hear me out.

Sincerely, Everett Mitchell

Viola Mitchell

P.S.
The Air Ambulance service in & out of Baker would have to be eliminated! Please do not do this in the Baker MT area.

NBAA

April 20, 2014

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14.AGL-06NR
Department of Transportation
Federal Aviation Administration
Fort Worth, TX 76137

To Whom It May Concern:

Founded in 1947 and based in Washington, DC, the National Business Aviation Association (NBAA) is the leading organization for companies that rely on general aviation aircraft to help make their businesses more efficient, productive and successful. The Association represents more than 10,000 companies and provides more than 100 products and services to the business aviation community, including the NBAA Business Aviation Convention and Exhibition (BACE) - the 5th largest trade show in the United States and largest civil aviation show in the world.

NBAA appreciates the opportunity to provide comments on Airspace Study 14.AGL-06NR - the USAF's Powder River Training Complex (PRTC) proposal. NBAA objects to the proposal due to the tremendous operational impact on our members. Covering parts of four US States approximately the size of South Carolina, these combinations of MOAs form a "brick wall" in the sky for all IFR traffic at or below FL 180, a substantial amount of air traffic that supports commerce in all four States down to local community level.] AM-21

NBAA is appreciative and supportive of the necessity for the USAF to "train like they'll fight" and realizes that an environment that allows for that within the NAS is essential for the protection of our United States. In order for the USAF to continue to be funded to accomplish their wartime missions, a robust and viable tax base must continue to be fostered in the United States to provide tax dollars for the military. One of the key sources of tax dollars and overall economic growth (GDP) in the US has been, and continues to be, the civil aviation sector. At the end of day, a balance needs to be found between military training/preparedness and the needs of civil operators to operate efficiently to meet the needs of their business models. In addition, non-participating military/State aircraft are impacted by all SUA/ATCAA activations and the military is responsible to be good stewards of tax payer dollars in support of those missions as well.] GE-5

This proposal has the potential to incur financial damages to many of our member flight departments through extra fuel cost, added wear on airframes due to reroutes and, in some cases, the potential loss of business by not being able to operate at all in support of their business model or customer needs. Below is a typical impact provided to NBAA by one of our Part 135 members:] SO-7

Round trip from Bismarck (KBIS) to Sheridan, WY (KSHR) in a King Air C90 today in current airspace:

KBIS - KSHR Direct (normal flight plan)
1:41 min / 929 lbs fuel
KSHR - KBIS Direct
1:23 min / 797 lbs fuel

Total for Round Trip (Direct) : 3:04 min / 1726 lbs fuel

Using the proposed MOA airspace:
KBIS-DPR-ECS-KSHR via Dupree VOR DPR and New Castle ECS
2:05 min / 1120 lbs fuel
KSHR-ECS-DPR-KBIS
1:47 min / 996 lbs fuel

Total for Round Trip (via revised routing around MOA) : 3:52 / 2116 lbs fuel

[redacted]

105

So in this scenario, for a single flight this operator incurs **48 extra minutes** and **390 extra lbs fuel**. The revised routing around the MOA will add **29% more miles (166 NM total)**. This NBAA Member would fly this or similar routings approximately 76 times a year based on historical flights.

This translates into almost 60 more gallons of fuel this operator has to buy (at almost $6/gallon), and 48 extra travel minutes for passengers to get to and from their destination. It will also increase the price of the charter by approximately $880 extra. As these flights are typically booked well in advance, this operator needs to be able to provide its customers an accurate quote for the flight. Not knowing which sections of the MOA will be active in the future makes this difficult and forces operators to assume a "worst case scenario."] AM-21

Should the FAA still approve the proposed airspace, NBAA requests the following mitigations be put in place prior to formal charting:

- The "Gap MOAs" should not be charted but rather activated by NOTAM] AM-6
  - Gap MOAs are proposed to be activated only during the LFEs and not scheduled for normal day-to-day military training
  - LFEs are proposed to occur approximately 10 calendar days per year for approximately 4 hours per day
  - The result is the Gap MOAs will not be is use for 355 calendar days but yet the fact they are charted on aeronautical charts will result in many pilots potentially assuming they are active "all the time"
  - Activating the Gap MOAs by NOTAM will much better reflect the reality of the airspace
- Provide operational priority for non-participating IFR aircraft operating to or from airports under the footprint of all active MOAs] AM-12
  - Airports such as Baker, MT (KBHK) are active airports that generate significant traffic volume as a result of natural gas and oil exploration in the Bakken formation under parts of Montana, North & South Dakota and Wyoming
    - As such, Baker will suffer potentially harmful economic impacts if operators perceive they cannot operate to or from KBHK when they need to – not when the airspace might accommodate them
  - FAA should give operational priority whenever possible to non-participating aircraft who have filed flight plans to or from an underlying airport at least an hour in advance of planned arrival or departure times
- In a meeting at Ellsworth AFB on March 27, 2014, the USAF verbalized an intent to publish actual use times of each MOA in weekly increments; these times should, in most cases, shave actual active times off the proposed scheduled times of the PRTC MOAs; this will help mitigate the large impact the overall PRTC proposal will have on non-participating IFR/VFR traffic that today transits this airspace unimpeded] AM-6
  - This "intent" should be a requirement levied by the FAA on USAF with the understanding last minute changes due to military requirements may still alter those activation times
- The US government should insure full radio coverage for all airports under the footprint of the proposed MOAs by installing Remote Communication Outlets (RCOs) as needed to insure pilots can contact air traffic control from the ground to receive clearances or close flight plans] SA-19

In summary, NBAA is opposed to this airspace proposal due to the potentially significant and permanent economic impact on our Members who have an operational business need to fly in this airspace. If approved in spite of this impact, we ask all of the mitigations outlined in this letter be fully implemented prior to charting of this airspace.] GE-5

Fort Worth, TX 76137

Dear Manager Operations Support Group,

On 17 July 2008, I addressed a letter to Ms. Linda DeVine, I believe the airspace manager 1st AF at that time, a position I once held when briefly with the DOD. She was based at Langley AFB, VA. In that letter I addressed a number of issues connected with the then proposed expansion of the "Powder River Training Complex" (PRTC) Military Operating Area (MOA).

I realize that this new proposal has been changed slightly. I have not changed my views much to be in favor of the revised proposal. I still question the need for further expansion of the PRTC.

. The proposed low level training flights have little, if no radar or communication availability.] AM-3

. The scheduling of such a MOA still leaves a lot to be desired with non-existing real time usage. The actual knowledge of usage is with the air traffic controller working those sectors. That's not acceptable! We need to know real time usage of the airspace, not just a blanket NOTAM!] AM-12

. With the Pentagon proposal of military downsizing, and general aviation increasing, the aviation community has need of more usable airspace.

. Economically it would not enhance North Dakota business. If the airspace was on a NOTAM to be used, commercial aviation would tend to bypass the route in favor of a more friendly environment.] SO-6

. With the Minot AFB partially deployed the need for them to use different airspace is not necessary. They Currently have sufficient airspace in North Dakota.] PN-2

. I feel the claim to cost savings is not real, and out of proportion. If the units need to proceed to Nevada or Utah, that's OK, the air refueling units need training also!] SO-14

. If the FAA feels a need to allow this expansion, some mitigation needs to be accomplished to allow for real time access prior to the implementation of the approval process. Also raising the military operating altitude to a higher altitude, recommend from 500 feet to at least 8000 feet.] AM-6] PN-4

106

. Finally, I ask the same questions as I asked last time. Is this airspace expansion really needed, other than to save a base from closure?] SO-25

Respectfully submitted, Darrel Pittman

Fort Worth, TX 76137

Gentlemen,

I am responding with my objection of the expansion of the MOA Powder River 1,2,3,4 separated by corridors or GAP MOA's (GAP A, B, and C).

As a business owner of Aerotronics Inc., an aircraft electronics/avionics company in Billings Montana, I am seriously concerned for the negative effects of the unreasonable and unacceptable expansion of the MOA to encroach on Montana even more that it currently exists. Through my 39 years of relationships with Montana customers, ranchers and fellow business owners all through the area from Rapid City to Gillette to Sheridan to Billings to Dickinson North Dakota and back to Rapid City I have found every one of my customers and friends in this area very worried and even more so bewildered by the notion of the addition of the added imposition of the military upon the airspace, land and land owners through this area.

I read the military explanation of the effects the military proclaims and I cannot help but believe they are living in some kind of a fantasy world. As the military experts proclaim the reasons for this huge expansion and the need for 240 days of training, for 10 hours a day plus another 10 days of a total no-fly zone, consistently I find myself in conversations with ex-military pilots that have a very different view of actual uses of the airplanes in combat versus training for this area and they all question the notions claimed in the proposal of the military. It is very interesting to me that each of these individuals is in agreement with the negative impact of this decision on the aviation businesses as well as commercial and private pilots through this area. It is difficult for me to question the military of their actions as I am a supporter of all of their combat efforts and ability to protect our country on the other hand I am questioning their reasoning for this expansion Doesn't it seem odd that the military study doesn't list any potential negative aspects to any of their operations as if they have not fully evaluated the situation?

PN-5

The personal use and business use of airplanes through this MOA area is going to have a severe and negative impact on those aircraft owners to continue to find use for their airplanes. Each of our customers from each of the cities mentioned and the underlining areas will have to negotiate their way through or around it to come for their aircraft maintenance and equally as important to conduct their daily business within or near this zone. Unlike the statistics reported by the military, I can guarantee that the majority of these aircraft are non-turbo charged aircraft traveling under 10, 000 feet using VFR flight rules and therefore will be in direct threat to safe operations. As normal business hours are Monday through Friday during the day then these general aviation operations have no relief for 240 days per year plus the full 10 days of the no fly zone operation. From aviation commercial standpoint, these corporate or Part 135 operations will be limited in operations which will definitely affect the traffic

SA-25

AM-20

107

through this area and result in reductions in needs for ground service and fuel operations and the result will be job loss. (Not a popular subject these days!)

Our estimated negative impact of loss of revenue would exceed $500,000.00 annually by business going to other avionics and maintenance facilities in Wyoming or other surrounding states. The impact will have over 3 million dollars of negative impact in the Billings economy just from our business losses. Equally, with the loss of business I would then have to reevaluate the employment status of our trained staff members currently working here. AM-20

As the national media has announced to the world the Baken region is the most active petroleum region in the world and is growing at an enormous rate, it is true that the aviation traffic directly through this area is going to be impacted negatively in every one of the 240 days that the area would be 'hot'. At a time when the dependency of energy is critical, then the military is determined to undermine the efforts and success of what the commerce can provide in oil independence and especially loss of jobs that the administration and most all of America is trying to sustain. It is understandable that the military does not seem to understand the impact as none of them live here, have to earn a living here nor will ever set foot on this land in their lives and so not to have a nickel in it makes it simple for them to impose their whim on an enormous part on Montana. Perhaps if they did have a nickel or dime in each gallon of fuel they burned when they crossed the Montana border they would consider another way to train closer to home or in a more practical manner. SO-22

From my rancher friends, they voice concerns for the noise and the negative reaction on their herds and wildlife. I am keenly aware of the numerous documented and proven private and government studies of how the birth rates for cattle, big game and small game are changed when there is an ever changing disruption of their habits. Is this a study that was ignored by the military in their analysis? I would guess as fragile as the bird and water fowl populations are that they too would be in jeopardy. BI-4

Which brings up a point, I am quite curious why the environmental groups have not been haunting your doorstep with their banners proclaiming the known negative effects of the noise, chaff, pollution and annoyance to the game of this area. BI-5

Lastly, I have been in the aviation industry for over 41 years and it is hard to believe that the FAA is being so complacent over the potential of high rates of incidents with general aviation aircraft mixing it up with the military operations. From my 41 years aviation experience, the FAA I know is very possessive of their airspace and it seems like they have been told to stand down on this issue. Is there a fox in the hen house?

I am in opposition of the proposed expansion of the MOA into the State of Montana due to the negative results we are going to be forced to endure. The reasons stated by the military and the area they find necessary to condemn for their expansion is unacceptable.

Sincerely,

Steven Vold
President
Aerotronics Inc.

Bowman County Airport Authority 2014

March 21, 2014

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14-AGI-6NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Re: Proposed Powder River MOA

Dear Federal Aviation Administration:

The Bowman County Airport Authority in the strongest possible way recommends that the FAA deny the expansion of the Powder River MOA.

We believe that the proposed expansion should be denied based on the following reasons, but not limited to only those reasons:

1. New Airport – We are in the final stages of completing our new airport. We began the process of locating and evaluating possible sites starting approximately 10 years ago. Our area has been growing and our old airport did not meet the needs of businesses and other users. We completed the EA in 2010 and received the Finding of No Significant Impact. All dirt work has been completed and surfacing and electrical contracts have been awarded. Construction crews began working this week, with a completion date of October 15, 2014. We will relocate late this year or early next year to our new location (KBWW) 4.5 miles east of the original location (KBPP). This expansion will adversely affect our new airport. We will be in the middle of PR-3 with no corridors or access during active MOA activities.
2. Safety – Local pilots or transient aircraft that still choose to transit the airspace will be at risk of mid-air collisions, near misses or air currents that threaten safety. There is no radar coverage or communications at low altitudes that would otherwise enhance safety. VFR flights are vulnerable to those conflicts. See and avoid is not much of any option when a B-1 bomber is closing at 600/mph.] AM-3
3. IFR Flights – IFR flights within the MOA would be significantly diminished. As stated above our new airport is designed with GPS approaches with lower decision heights. That effort would significantly restricted by the MOA. We would see less traffic resulting in less fuel sales and overall lower economic activity in the area.] AM-21] SO-7
4. Weather Modification - Bowman and Slope Counties in North Dakota are home to the longest active weather modification program in the world. They "seed" clouds by releasing silver iodide both above and below thunderclouds. The airplane below the thundercloud is typically VFR and at or below 6,000msl. The airplane above is on an IFR flight plan at whatever altitude is required to get on] AM-13

108

top. This program has dramatically lowered hail insurance premiums for area farmers. They can't plan the mission, it is dictated by the current weather. Bowman Airport has radar that is employed and the meteorologist makes the call to go. If the MOA is active they will be severely restricted in their ability to "seed" the cloud resulting in increased damage to crops and property in the area.

5. Emergency Flights – Even though the Air Force indicates that they will give priority to emergency flights this is a major concern. Medical flights from our area to a tertiary medical facility go to 4 major areas, Bismarck, ND to the northeast through the MOA, Rapid City, SD to the southeast through the MOA. Dickinson, ND to the north through the MOA, and to Billings, MT to the west through the MOA. Flights in all directions will have to be conducted through the MOA. SA-19
6. Health Care Professionals – As a rural area we are served by incoming and outgoing medical professionals who provide service on a regular basis. These are not emergency flights, but rather regularly scheduled flights into and out of our area. These flights will be compromised as they will not want to schedule regular flights that may or may not be able to be completed if the MOA is active. SO-5
7. Wildlife monitoring – Hunting and wildlife are integral parts of the economy in southwestern North Dakota. Federal and state wildlife agencies regularly fly to survey wildlife.
8. Predator Control – Predator control is vital to ranchers to protect their livestock. State sponsored predator control agents and other contract pilots use the airspace regularly.
9. Firefighting/fire scouting – Prairie fires are a fact of life on the prairie. Local firefighters/pilots guide firefighters on the ground to fires and to enhance the safety of the firefighters. AM-33
10. Ag Applicators – Ag applicators regularly use altitudes in excess of 500 feet going to and from target field and to avoid towers and other obstacles. SA-7
11. Flares, Chaff & Sonic Booms – The use of flares & chaff are of particular concern to area ranchers. Fires that might result from improper use or weather conditions would destroy valuable pasture and grass land. Sonic booms will scare livestock and residents. BI-5 BI-4
12. Economic Impact – The largest reason to deny this expansion is the adverse effect it will have the region's economy. This part of the Great Plains has seen out-migration for several decades. In the last 10 years that trend has reversed. Energy (particularly oil) development has exploded. The biggest reason for relocating and lengthening our airport is to accommodate the increased traffic that we are experiencing with oil companies visiting the local oil fields. Hunting traffic is another. In the fall of the year, hunters from all parts of the country converge on southwestern North Dakota to hunt pheasant, deer & antelope. The ability to land in Bowman and stay in Bowman attracts them. If they have to land elsewhere, we will lose that business. Bowman also has several farm implement dealers that serve a large trade area. The airport receives a large amount of traffic to get parts at those dealers. Clearly the MOA will affect all of those business, and other ventures adversely. SO-6 SO-9 SO-10

108

...n County Airport Authority 2014

13. Radar Coverage – Southwestern North Dakota lacks adequate radar coverage from ATC. To establish radar contact you must get several thousand feet above ground to be seen by ATC. It would help considerably to avoid mid-air collisions if radar coverage were to be expanded.
14. Communication Gap – Southwestern North Dakota is located in another gap area in communications. A climb of 5,000 feet or more is required to communicate with center. A local connection to flight service exists, but not center. Improving the communication in the area would help to mitigate this concern.

AM-3

The above list of concerns is not intended to be exclusive. Our opinion is that there are more reasons to be opposed to this expansion than to support it.

Our area is growing. We have worked hard to build our economy and reverse the trend of out-migration. We have made progress. But, this expansion will clearly set us back in our efforts. If America is to succeed, rural America can't be left behind. Please deny this expansion of the Powder River MOA.

Sincerely,

Rodney Schaaf, Chairman

Eugene Miller, Vice-Chairman

Andy Mrnak, Member

John Soreide, Member

Bob Morland, Member

Kent M. Wheeler
Department Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Mr. Wheeler,

As a young pilot just getting started in the Bismarck, North Dakota area I am opposed to the expansion of the Powder River MOA expansion. This proposed expansion covers most of the area that I would travel through and would be highly inconvenient.

The proposed area will increase the size of the Powder River MOA by at least four times. This would make it the largest over land training area in the continental United States. This will make me, and other pilots have to fly more miles to get around this area and it will significantly increase the costs that we incur. With a significant increase in cost, myself and other pilots will not be able to appreciate the joy of flying to a lot of destinations. Not only would the costs increase, but there would be a lot of places that I could no longer go because I would not have enough fuel in reserves to make it around the MOA and still get to the next closest airport.] AM-6] SO-7

I do know that there is a section in the "Miscellaneous" that states "No restrictions will be imposed on nonparticipating Visual Flight Rules (VFR) aircraft." As I understand there will be no restrictions on these aircrafts, but I can honestly say that it is going to be almost impossible to see and avoid aircraft that do not have radar guidance and would make it extremely dangerous to those pilots and the military. This danger will be increase with the military at 500 feet and at supersonic speeds to practice detection avoidance, for that is a very common height for nonparticipating VFR aircraft to be flying.] AM-3] AM-14

As an employee and a member of the Agricultural community, the proposed MOA would negatively impact the production of many farmers. The aerial application business is not only a necessity but in most years the only way that farmers can get their fungicides, herbicides, or pesticides applied. In raising crops, some are very susceptible to disease and bug infestation. The window to get these issues under control is extremely narrow and if the aerial sprayers cannot fly in that area during that window, an entire area can lose their crop/s for that year in a matter of a day.] SO-2

I think that I understand the importance for training, but I would hope that the travel to and from Nevada was more than just a flight for the crew aboard that aircraft. I would hope that they are practicing evasion tactics or simulating emergency issues to better prepare them for what they could face in their career as bomber pilots.] PN-2

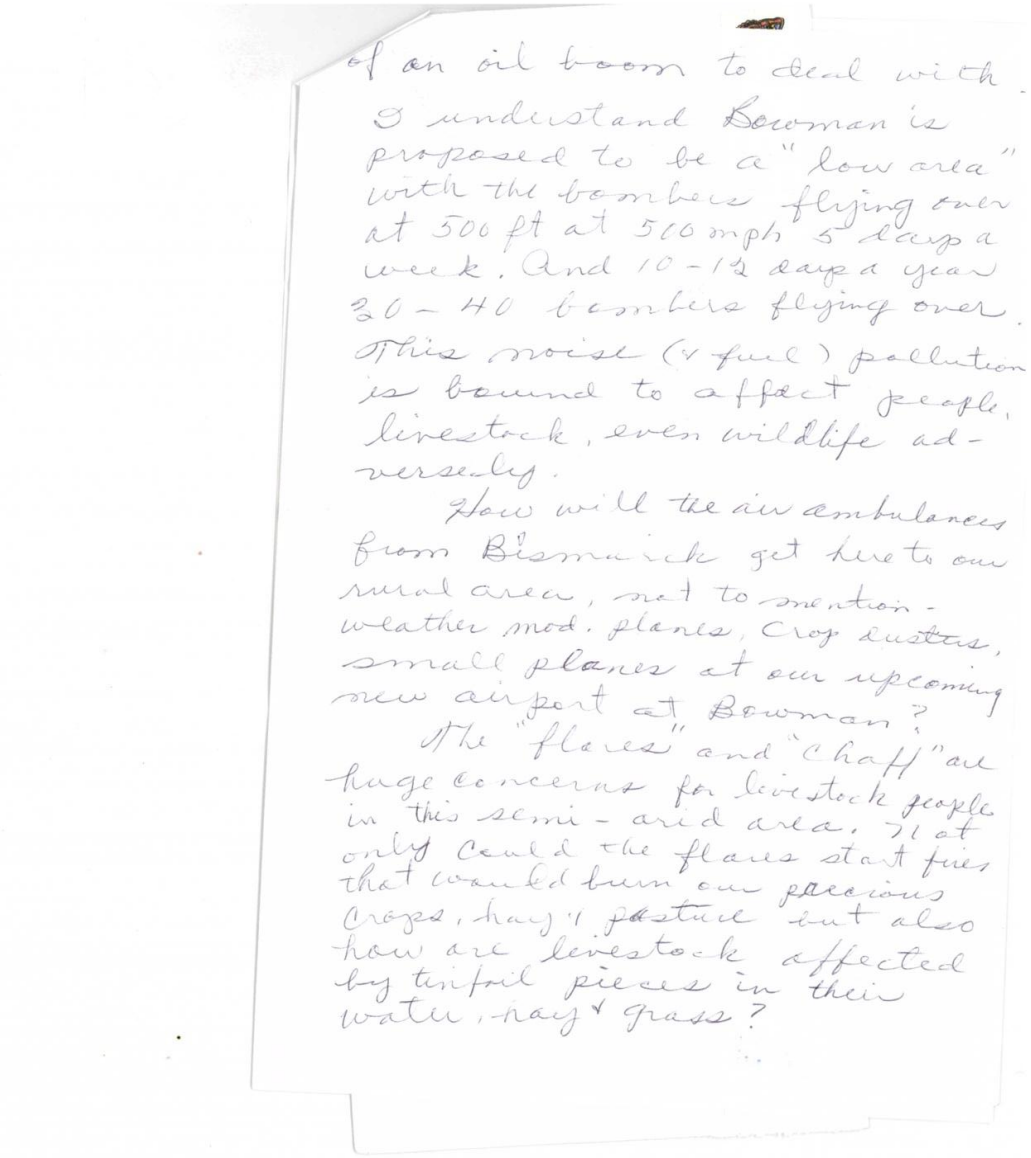
AGV-C2 Airspace Study
Dear sir or madam!

I am concerned about the Air Force's proposed expanded training area that would affect our area.

Sen. Heidi Heitkamp says, "We need to make sure our military has the capabilities to protect our nation but a strong effort needs to be made to limit the impact of this ~~impact of this~~ potential expansion on North Dakota Communities and businesses."

Our greatest loss would be the loss of peace and quiet which is one of the reasons we live here on our land. Western ND already has the impact PN-2

116



of an oil boom to deal with.
I understand Bowman is proposed to be a "low area" with the bombers flying over at 500 ft at 540 mph 5 days a week. And 10-12 days a year 20-40 bombers flying over. This noise (+ fuel) pollution is bound to affect people, livestock, even wildlife adversely. AM-14 AM-27 BI-4

How will the air ambulances from Bismarck get here to our rural area, not to mention - weather mod. planes, Crop dusters, small planes at our upcoming new airport at Bowman? SA-19

The "flares" and "chaff" are huge concerns for livestock people in this semi-arid area. Not only could the flares start fires that would burn our precious crops, hay & pasture but also how are livestock affected by tinfoil pieces in their water, hay & grass? BI-5

116

Five days a week we will hear these planes roaring over us (including at least 3 nursing homes). Please do not include this quiet place in your plans.

Chuck Hagel says a large drawdown in military is coming. Hopefully, the Powder River training area will be enough.

Sincerely,
(Mrs.) Betty Mill

FROM: Gene Davis

SUBJECT: Powder River

As an area rancher, I am very concerned about the proposed Powder River training areas expansion! From what I read and hear, there are many restrictions for my ranch and community. Many years ago, the B-52's had a low altitude run over my ranch, with many issues when working with my livestock!! Low altitude aircraft and noise created many problems for us. It's difficult enough herding livestock, now throw in noise and something unusual!! So now it looks like I'll have to put up with this headache again? BI-4

So why does the military need to have an area 4 times bigger? Why do they have such a low altitude floor, 5 days a week? Seems to me, that training could be done in areas east of Minot AFB, already in place! If Ellsworth AFB wants closer areas, put it in South Dakota! Simply raise the area floor to reduce the impacts! Or limit the real low altitude restriction to 1 day each week!! PN-5 PN-2

I support the military, but feel a compromise must be made between all impacted parties. Please consider some recommendation above before making a final decision. Thank you for your attention.

Concerned rancher and citizen

Manager OSG
Dear Sir's
In response to the military proposal to expand their "practice range" in eastern Montana, I would like to express my opposition to that.
At one time we had an Air Force practice bombing range here in Rosebud County Montana and they flew right over the ranch. Some of that flying was VERY low and scared the live stock as well as us humans. To have anything of that nature here again would NOT be right. It is very dangerous for a person on horseback to have a plane suddenly pop over a hill right on top of you ,so to speak, and the horse explode under you. It can be bad for anyone but for kids it would be a disaster. SA-9

Please DO NOT allow such a thing to happen .

ATTN: To Whom It May Concern

RE: Expansion of Powder River Range

To all concerned and involved, please take a moment to read what I have to say about the proposed expansion of the Military Powder River Range. The Draft Environmental Impact Statement (Draft EIS) needs to hear area ranchers, farmers, oilfield workers, and private and commercial pilot's concerns from low flying Air Force jets in training missions over the proposed area. I do not think that those who were opposed to this expansion 6 years ago have changed their mind. Impacts on the health of livestock and/or any animals from jets passing over at less than 500 feet at high speeds, creating extremely loud noise range from being scared to death to being affected in a negative way for the rest of their lives. I remember working in the oilfield for Shell Oil in the mid 1980's and everyone that lived around this area knew about the flight paths that were used at low level flights, so when I and the crews would be working in these areas we always tried to get mentally ready for the unexpected shrill of a jet flying very low and so fast that in the blink of an eye you'd miss it and it would still badly scare everyone that was working on that location. I heard of many times over the years of persons on the ground working getting the crap scared out of them, sometimes so badly they would turn and run into something because they were thinking something had blown up, due to our work being rather dangerous already. This makes for a much less safe working atmosphere, because all attention is not on the task at hand and it makes for jumpy, nervous people, and is hard on the heart. This would not be much different for livestock. Effects are loss of weight, heart attacks, and sometimes aborting the unborn. What kind of price does the Air Force put on this kind of activity? The military has enough of a range now for super low flight training. I have witnessed several times jets in these areas flying lower than 500 feet. If you need more range then keep your jets above 12,500 feet and maybe you will get more folks to agree to your expansion. The wars in the recent past have been fought from altitudes higher than that so they don't get shot out of the sky from civilians with surface-to-air launchers, and probably will continue to be. I am a private pilot who enjoys flying when I take the time out of my busy schedule of working in the oilfield (for the past 35 years) and helping get the crude out of the ground and shipped to refineries that make the fuel your jets operate on. We in the Baker, MT area would be almost shut down and would have to move outside the proposed expansion area if it passes. We need our airport open to the public for air ambulances to be able to fly directly into Baker, lives are at stake! There has to be a better solution to just bullying into the area and telling us that we have to put up with what we get from the military or governors from South Dakota/North Dakota and not get to vote or work together to find a solution that all can live with, some kind of middle ground.

Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth Texas, 76137

Dear Sir/Madam,

I am Anita Lee, I have lived on this farm with my husband Kenny for 43 years. I would like to explain what air space means to us.

We raise wheat, corn, sunflowers, and millet. Starting the first of September, Kenny, and our son Rick, will spray all of the ground that is to be planted to winter wheat. They usually use ground sprayers with Roundup (name of chemical). Ground sprayers are self-propelled, or pulled by tractors and roll on the ground. Ground rigs are safer than spraying with air planes but they still have to watch weather conditions very carefully. The wind must be from the right direction to protect neighboring fields, trees and pastures, and not be over 20 miles per hour. The temperatue must be between 50 and 85 degrees. In South Dakota, this is a challenge. The spraying is almost all done between 5 am and noon. By noon, the wind is usually too strong and sometimes the temperature is too high. Also, they must have several hours before a rain, so the chemical can be absorbed before it washes off. If the ground is muddy, they must hire a 'crop duster', which means a spray plane.

In this area, winter wheat should be planted between September 10th, and the end of October. The ground must be sprayed before the wheat is planted to kill the weeds. If it is not sprayed, the weeds will take all the moisture and the wheat will not come up. They can't spray the weeds after planting because Roundup will kill the little wheat plants. They plant about 2500 acres of winter wheat and it is always a grueling task to get it all done on time. Any day that they can't spray adds to the stress. Wheat must be planted by the end of October to qualify for crop insurance. Crop insurance is necessary for our financial security and peace of mind. Also, most lenders will not loan money to operate on, if the farmer doesn't have insurance. (They want to be sure of getting their money back.) If wheat is planted earlier, there is more damage from grass hoppers and crop diseases. Since winter wheat is the biggest and best crop for this area, we need our air space from September 1st till October 31st.] AM-33

Obviously a jet will not hit a ground rig and kill the pilot, but wing vortices can move the chemical to the neighboring field or trees. Since any spraying operation must avoid wind over 20 mph, a passing plane would disperse the chemical onto the wrong field and kill alfalfa, grass, etc. This would be like having a low flying jet pass over a car being painted. Suddenly, your beautiful red paint is all over your neighbors' cars, houses, windows, etc. Chemicals can't be 'removed' like paint.] SO-2

International regulations require commercial airlines to be separated by 6 nautical miles to protect them from wing vortice interference. This is conservative since research has shown that wing vortices move about 90 knots per hour and remain about 10 miles behind the plane. **Small aircraft are supposed to stay at least 1000 feet below other aircraft.** Vortices stay longer in calm winds and dissipate faster in

124

higher winds. Ag sprayers only work in calm to light wind conditions. Since the Air Force claims to be flying at 500 feet AGL, (and current residents of the Powder River MOA say it is more like 100 feet), clearly the wind vortices will be a problem for agricultural chemical application. SA-7

April brings us to the time when the winter wheat must be sprayed to kill the spring weeds. This is the most difficult spraying operation, and when many farmers who usually use ground rigs have to call crop dusters. This is the time when spring rains often make the fields too muddy to drive through. There is about a 2-week window when this has to be done. If it is sprayed too early, weeds will sprout up after spraying and choke out the wheat. If it is prayed too late, the wheat will be damaged. This time span is sometime in April through May. It varies with the maturity of each field. This varies because of planting time, weather, location, etc. If it is not done, the crop will be poor, or lost completely. We need our air space in April and May.

April through June also brings the chemical application for the spring crops (spring wheat, corn, millet, sunflowers, safflower, oats, etc.) This is just like the fall spraying for winter wheat.

Some years, because of extra rainfall, the winter wheat must be sprayed again before harvest. This is usually done with a plane, so that the mature heads are not knocked off the wheat. This is done in July and August. Sunflowers are also sprayed in the late summer to kill insects. Sunflowers must be sprayed by air because they are too tall for a ground sprayer.

Alfalfa can be sprayed from April through September to kill insects. This brings us around to September again when we start spraying the winter wheat ground. Farmers spend as much time on their spray rigs as ranchers spend on their horses.

The north west corner of South Dakota raises 5 to 7 million bushels of winter wheat a year. This is a million loaves of bread a day. North Dakota raises more wheat than South Dakota. This doesn't count all the other crops. Cattle is the number one commodity to come from this corner of the state. The average farmer puts about $200,000 a year into the local economy and pays about $20,000 in state and local taxes. There are about 3,500 farms in this corner of South Dakota. My numbers only apply to the north west corner of South Dakota, covered by this training area. I do not have the Agricultural Statistics books from the other three states, so I left them out.

This is a little idea of the number of people in the world who will go hungry if you take our air space. I hope you plan to reimburse us for our lost income and reimburse the state, counties and cities for the lost tax revenue and sales.

I think everyone understands the danger to humans and animals when livestock are confined and spooked by low-flying aircraft. Spring calving and lambing runs from January through June. Fall calving and lambing runs from June through December. The Air Force has promised not to fly over us during calving and lambing. We can assume that was an empty promise, or they really don't understand agriculture. Do they really think everyone calves (lambs) the same time, and works with livestock only a few days a year? SO-13

We think this is more important than making 12 to 24 B-1s travel to Nevada to train.

Another concern is the way damage claims are handled. I have spent some time studying how damage claims are handled in other MOAs and I have found they are usually not handled. The EIS stated several times that claims would be handled out of the Ellsworth Public Affairs Office, and gives a phone number. I dialed that number to see what happened. I got an answering machine. I gave my home and cell phone number and requested a call back. That was 4 years ago and I have still not received my call. That is about the way other MOAs handle claims, according to the reports I have read. At the EIS GE-8

124

meetings, the Air Force speakers talk about how few damage claims they receive. I can certainly believe that. They don't pay claims, so people just give up.

Crop damage, like I described above is not covered by any type of private insurance. This is another reason that we **can not farm in a MOA**. A fair way to handle claims is to turn them over to local authorities. Whether it be the Sheriff, or County Commission, they should be handled by an elected County official. If, as the Air Force claims, there will be no damage, this should not be a problem. If there is a problem, the fifth amendment says "*nor shall private property be taken without just compensation.*"

This brings me to my final point. The Constitution gives the Government the right to condemn and take private property, by eminent domain, for use my the military. However, the property owner must be **paid** a fair price for that property. We have heard nothing about compensation for the taking of our ability to farm our land.

Thank you!

Anita Lee

RE: Airspace Study 14-AGL-06NR

Dear Sirs,

I am opposed to the expansion of the Powder River Training Complex MOA.

I own and manage a cattle ranch that is located under the proposed PRTC MOA. The low flying aircraft and sonic booms will be detrimental to my livestock and wildlife due to increased stress levels. We will lose the peace and tranquility that Eastern Montana is famous for. BI-4

I fly private aircraft to check on the livestock and operations of my ranch. My slow flying aircraft and the high speed military aircraft are not compatible in the same airspace. This will cause serious safety issues for both. SA-9

The US Air Force has plenty of existing airspace for training. Any perceived savings will be more that offset by negative economic impacts due to the expansion. I find it interesting that Ellsworth AFB and Rapid City, which will have the greatest positive economic benefit from this expansion, are not in the expansion area. Modern air warfare is changing dramatically but I doubt the B-1 and B-52 are the future of air warfare. SO-21

Sincerely,

Glenn Gay

Dear Sir or Madam:

This is a comment on the expansion of the Air Force training ground in southeastern Montana. I live on a ranch between Baker and Ekalaka, well within where the Air Force is proposing to train bomber crews. Our ranch has had bombers fly over it before, mostly B-52s, however I distinctly remember several times that B-1's have flown over. It is an entirely different experience. The B-52s are as slow as they are ugly. You can get used to them. But I can't imagine ever getting used to the B-1s.

It happened over a decade ago, but I still cringe at the memory of when a B-1 flew directly over my house. I was going blissfully about my business out in my yard when I suddenly heard a roar that quickly grew impossibly loud, and then it got even louder. It felt like an explosion going off over my head. I saw perhaps a brief flash of something going past, maybe a flicker of a shadow on the ground, and then it was over. The difference between being buzzed by a B-52 and a B-1 is that you can figure out what is happening to you with a B-52. You simply can't with a B-1. It happens so quickly, you haven't a clue. It is an incredibly unpleasant experience, scaring you damn well out of your wits.

People, livestock, and wildlife might be able to become accustomed to B-52s. It simply isn't possible for B-1s. More likely, the startle response from every flight will make the next one worse. I expect that livestock and wildlife will stampede when the training flights begin, breaking down fences and injuring themselves. Livestock will gain less weight, and wildlife will have problems reproducing and putting on enough weight to survive the winters.

BI-4

I'm told that it is my patriotic duty to support the Air Force's efforts to train bomber crews. I might otherwise be sympathetic to this argument, but the horrible fact is that the most likely use of the bomber crews' skills will be to secure the oil fields of the Middle East. That is obviously what happened in both Iraq wars. The invasion of Afghanistan and our later involvement in Pakistan are also both derived from American entanglement in the politics of Middle East oil. We have spent trillions of dollars on wars in the Middle East fighting for oil, a cost that has not ever appeared at the gas pump, but has been added to the national debt, cutting deeply into money that could be spent on environmental protection, education, welfare, and research.

126

I just can't bring myself to support wars for oil like these. I think that it is immoral not only to risk American lives in them but also to kill much larger numbers of non-Americans in them as well. Not only that, fossil fuels are disrupting the climate. We need to quit using them. The consequences will be severe if we don't. I have been following what climate scientists are projecting, and if they are right and if we continue business as usual much longer, I can say with considerable confidence that my family simply won't be able to grow a crop here in Montana by the end of the century. Nothing, at all, if the temperatures go over 10°F, as some climate models say they could. This is really bad news for everyone else because everything south of us will be worse off. A severe food crisis is coming with climate change, possibly before even midcentury.

As a result, continued reliance on fossil fuel is undermining national security. We shouldn't be wasting our resources securing Middle East oil; we should be using them to get off of fossil fuel.

It is entirely possible to do this. I am in the process of putting up a 2,000 watt solar panel system for my house that should zero out my electric bill. It is going to cost me $3,000, with tax credits. (I have a very efficient passive solar house.) I am installing it myself, and I don't have to get a permit, so my costs are lower than what others would pay. As a result, I expect to pay it off in 6 years, and then I should have free electricity for at least 20 years. (The warranty on my panels is for at least 80% of their original output at the end of 25 years.) If I doubled the size of my system, I would get enough additional electricity to drive a Nissan Leaf, an all electric car, 10,000 miles a year. If it replaced a car that got 20 mpg, it would eliminate the need for 500 gallons of gas every year. And if a gallon of gas costs $3, it would replace $1500 of fossil fuel costs a year. In other words, my solar panel system would pay for itself in 2 years replacing gas from the Middle East, and I would be able to drive my electric car 10,000 miles a year for free for at least 20 years after that.

The point of this is, we don't need to train bomber crews how to bomb the Middle East. We don't need to risk the lives of Americans in oil wars in the Middle East, and we don't need to kill anybody who lives there. We could much better insure the security of America by switching to renewable energy. And if we did that quickly, as an added benefit, we wouldn't have face the probability of being involved in wars over food in a couple of decades when the climate changes and everybody in the world blames us because we were too dumb to quit using fossil fuels.

We need to change our energy policy, not train bomber crews to fight in the next war over oil.

Sincerely,

Wade Sikorski

Comments: The proposed plan appears to have a significant impact on non military aviation. At the UMAS Conference in Grand Forks, ND this week we were told that the MOT AFB contacts did not seem to know about the plan. Also, a few of the small airports in NW South Dakota did not know about the plan. We heard livestock producers are concerned. Might be time for a media blitz to inform people.

To: Manager, Airspace Study 10-AGI-6NR Feb. 20,2014

From: Rodney Schaaf

Subject: Proposed Powder River Training Area Expansion

I am very concerned about the negative impact from the proposed Powder River expansion.

1- Economic Growth Impact- The companies involved with OIL, coal, natural gas, wind charger energy,etc., will have to alter flight operations into our local airport. Bowman is building a new airport to accommodate larger aircraft associated with the Bakken and Three Forks oil formations. The proposed military areas will have many airspace , altitude, and operational restrictions, which will divert these company plans to other airports, outside the training areas. This impact will trickle down, affecting the economic bottom line for the new local airport, fuel sales, maintenance, hangar rent, etc. Also affected would be local hotels, small businesses, restaurants, etc.

SO-5
SO-6

2- Bowman Community operations- Many small rural hospitals rely on medevac and lifeflight operations to Bismarck for emergency care. These operations in military areas require undue flight time, extra navigation, corridor entry and exit points, altitude restrictions, etc., where timing is essential for care.

3- North Dakota Atmospheric Board- Bowman and Slope counties utilize Weather Modification program for hail suppression and rain enhancement. Timing is critical with these operations, and the military area restrictions would greatly affect these operations.

SA-19

128

4- Fire Fighting Operations- Our community uses aircraft with rural fire departments, to assist in scouting, positioning of fire vehicles and equipment,etc. The use of military flares (burnt or duds) is a major concern to these rural fire departments.

5- Wildlife Management- Our community has an abundance of wildlife. Hunters from all across America fly here to hunt. The Game and Fish Dept. utilize aircraft in their wildlife management programs. Restrictions will have an economic impact on hunting lodges, B & B's, hotels, restaurants, taverns, etc. NO-5

6- Aerial Applicator Operations- North Dakota leads the country in honey production. These sensitive areas, along with wind charger towers, and new cell phone towers, require crop dusters to fly higher, in transit. These operations would be in the 500' above ground restricted airspace, which could pose a safety hazard. SA-7 AM-14

7- Livestock Production- Producers are already affected by dust pollution, with the increased oil truck traffic. Another concern will be military chaff dispensing . Will this have an effect on animal or wildlife ingestion or contamination of surface water supplies? BI-5

8- Renewable Energy- Up to 130 wind charger sites have been proposed in our area. Will these towers affect the military radar signals? Again, lower flying aircraft will have to avoid these sites or fly higher. The higher altitude will be in the 500' above ground restricted airspace, which will be a safety hazard. CM-4

128

Economic growth and development, along with agricultural commodity production are essential for the survival of many southwestern North Dakota communities. The expanded Powder River training areas would greatly impact the growth potential and well being of our local community.

Considering the above items, I hope some modifications could be made to the Training areas. Some recommendations include: DO-3

A- Proposed training areas have a bottom floor of 8000' MSL PN-5

B- The 500' above ground restriction to be used 1 or 2 days/ week instead of 5 days/ week. GE_8

C- Direct telephone link to military operation headquarters in charge of the training areas, to have instant updates as one is flying near the areas.

These items would greatly reduce the impact of our flight operations, and hope they will be considered. Thank you for your attention.

Sincerely:

Rodney Schaaf

We Fully Disagree with your Exspansion at Powder River Training Complex.

Our views concerning the Powder River Training Complex - Ellsworth AIR FORCE Base, So. Dakota exspansion. We have invested $75,000 ~~as~~ plus in my Airplane. That might not be much to you but it is to us. Now We won't be able to fly it because the military only has to give 2 hrs. notice that the airspace is closed & it is one hour Travel time by Car to the airport. Once We get there it will be closed OR closed shortly after I get there & ~~the~~ the airspace has closed after we go up the danger of being killed is great. I would loose my whole family. How am I supposed to visually see Jets that fly at sound Breaking Speed from our little airplane. If they fly close at their spee the turbulance will TEAR Wings off of My airplane then we are done for. AM-12

you show 240 days of RESTRICTED no fly time for me. flying 500 feet above land which will be Rattling the house windows, dishes out of the Cabinets, Scaring our animals, killing my developing chick eggs, devaluching the value of (color) PN-5 BI-4

129

pg. 2

property + that's not counting what the sonic booms will add to the mix. NO-2

Who is going to be responsible for all of the damages + extra costs to us. GE-8

All of the extra noise level will also have an alarming effect on our hearing. NO-5

We bought + moved here for peace + quiet + now you all are deciding we are not important enough to have our peace + quiet. We also bought here for retirement + to live off the land freely.

What we would like to know is where are our constitutional rights in all of this? It sure isn't freedom. We are not rich so we cannot use money to get what we want like you can. We want someone on the little peoples side for a change vs big business. We don't have the option to pull upstakes + move to another area.

Ken + Doris Bone

As rancher in the western South Dakota proposed Powder River Training Complex expansion area, I am adamantly opposed to the further expansion over private property. We use an airplane almost daily during certain seasons for checking cattle and water for our operation. Low level high speed military operations will negatively affect the safety of our operations as well as the composure of our livestock. SA-1 LU-3

The proposed flight use will severely restrict local air travel for repairs and supplies for our ranch. Because of the terrain and remoteness of western South Dakota private operators are required to reach altitudes much higher than the proposed military training altitudes to contact flight control for departures and arrivals to their property and local airports. AM-6

We also have private applicator and hunting FBOs in this area which would be subject to undue hardships resulting from military operations. AM-5

In conclusion we already have enough restrictions and stress navigating the current MOAs in this country and it is getting tougher each year to keep our operations profitable without the additional physical and emotional stress that will originate from this proposed expansion.

RE: Powder River Training Complex Expansion

Dear Sirs:

We are writing to voice our objection to the expansion of the Powder River Training Complex. We realize that the Air Force needs to be able to train but, believe that there are already less populated areas where that training can be done. PN-2

This training could potentially scare livestock and add to the economic problems of our ranchers. LU-3

The increase in oil production in southwestern North Dakota has greatly increased the amount of commercial and emergency flights. Training of the Air Force should not be allowed to hinder private plane travel in our area. Nor should it increase the possibility of lives being lost because the air ambulance cannot fly or has to delay its flight because of the training. No amount of money saved can pay for a life. AM-6 SA-19

Thank you for taking the time to consider our concerns,

Lorrie Bazalsky, Slope County Auditor

Subject: Powder River MOA

The members of the Havre Flying Club met and discussed the porposal for the Powder River MOA. It was decided that we were not able to see the benefits for allowing the above subject. We do believe that it wil affect general avaiation in a negative way beyond the benefits gained. The air space in question in Montana will have a great economic effect as well. Low level flights will also affect livestock in a negative way. AM-6 BI-4

As for the effects on the Havre Flying Club, it will restrict travel from North Montana to any area to the east. I travel east several times a year to visit family and friends as well as attend aviation events such as Oshkosh air show. Our club has five (5) members at the present time, and we voted to not allow the above subject. AM-6

Your vote to not allow the MOA would be appreciated.

Regards :

Robert H. Breum

To: Manager, FAA Airspace Study

From: Bowman Area Chamber of Commerce Office

Subject: Proposed Powder River Training Area Expansion

We are very concerned about the negative impact from the proposed Powder River expansion

1- Economic Growth Impact-The companies involved with OIL, coal, natural gas, wind charger energy, etc., will have to alter flight operations into our local airport. Bowman is building a new airport to accommodate larger aircrafts associated with the Bakken and the Three Forks oil formations. The proposed military areas will have much airspace, altitude and operational restricts, which will divert these company plans to other airports, outside the training areas. SO-17 AM-5

This impact will trickle down, affecting the economic bottom line for the new local airport, fuel sales, maintenance, hangar rent etc. Also affected would be local hotels, small businesses, restaurants, etc. SO-6 SO-10

2-Bowman Community operations- Many small rural hospitals rely on Medevac and life flight operations to Bismarck from emergency care. These operations in military areas require undue flight time, extra navigation, corridor entry and exit points, altitude restrictions, etc., where timing is essential for care. SA-18 SA-19

3-North Dakota Atmospheric Board-Bowman and Slope counties utilize Weather Modification program for hail suppression and rain enhancement. Timing is critical with these operations, and the military area restrictions would greatly limit the effectiveness of these aircraft to operate at the precise time. AM-6 SO-28

135

4-Fire Fighting Operations-Our community uses aircraft with rural fire departments, to assist in scouting, positioning of fire vehicles and equipment, etc. The use of military flares (burnt or duds) is a major concern to these rural fire departments. AM-33

5-Wildlife Management- Our community has an abundance of wildlife. Hunters from all across America fly here to hunt. The Game and Fish Dept, utilize aircraft in their wildlife management programs. Restrictions will have an economic impact on hunting lodges, B&B's, hotels, restaurants, taverns, etc. SO-9

6-Arial Applicator Operations-North Dakota leads the country in honey productions. These sensitive areas, along with wind charger towers, and new cell phone towers, require crop dusters to fly higher in transit. These operations would be in the 500' above ground restricted airspace, which could pose a safety hazard. SA-7

7-Livestock Production-Producers are already affected by dust pollution, with the increased oil truck traffic. Another concern will be military chaff dispensing. Will this have an effect on animal or wildlife ingestion or contamination of surface water supplies? SA-14

8-Renewalbe Energy-Up to 130 wind charger sites have been proposed in our area. Will these towers affect the military radar signals? Again, lower flying aircraft will have to avoid these sites or fly higher. The higher the altitude will be in the 500' above ground restricted airspace, which will be a safety hazard. SO-17

Economic growth and developments, along with agricultural commodity production are essential for the survival of many southwestern North Dakota communities. The expanded Powder River training areas would greatly impact the growth potential and well being of our local community. SO-11

Considering the above items, we hope some modifications could be made to the Training areas. Some recommendations include:
A-Proposed training areas have a bottom floor of 8000' MSL
B-The 500' above ground restriction to be used 1 or 2 days/week instead of 5 days/week.
C-Direct telephone link to military operation headquarters in charge of the training areas, to have instant updates as one is flying near the areas.
These items would greatly reduce the impact of our flight operations, and hope they will be considered.
Thank you for your attention.

Sincerely,

Chris Johnson, President

Re: Powder River Military Operational Area expansion Airspace Study 14-AGL-06NR

To Whom It May Concern:

I write to express my desire for the FAA to reject the request to expand the Powder River Military Operation Area into the State of North Dakota. I make this request as a private pilot as well as through the office of the Grant County State's Attorney. Enclosed is a copy of a resolution passed by the Grant County Commission also opposing this expansion.

Every one of the county commissioners, as well as I personally, have lived through the days when North Dakota essentially was a military playground. Low level operations were conducted over farmsteads where I and each one of the county commissioners lived. The havoc that it wrecked on livestock production is completely unacceptable. Additionally, since the time of the '70s when many low level flights were disruptive to agriculture, things have changed. Despite the assurances that private pilots, charter pilots, and others may operate in an active MOA, in real practice they are prohibited. The Military Operation Area, when activated, greatly reduces safety for general aviation. Of particular importance to a rural county such as Grant, is the operation of air ambulance service which will not operate in an active military operation area. This, along with the negative effects on the quality of life, livestock, general aviation and other aviation concerns make the expansion of the Powder River MOA highly detrimental and must not be allowed to occur.

BI-4

SA-1

SA-19

If you have any further questions of me, I may be contacted at the above address or telephone number.

Sincerely,

Todd A. Schwarz

136

Resolution of the Grant County Commission

March 19, 2014

Whereas, the FAA has put forward a proposed expansion to the Powder River Military Operation Area that would include a substantial portion of the State of North Dakota, including the County of Grant.

SA-19

Whereas, the proposed expansion would have an effect in Grant County and other surrounding counties that are adverse not only to the operation of air ambulance service, charter and general aviation, in and through Grant County, as well as an adverse effect to livestock and farming operations along with general quality of life;

AM-6
BI-4
LU-3

It is hereby resolved that the Grant County Commission resists and urges the FAA to deny the request for the expansion of Powder River Military Operation Area into the State of North Dakota and specifically over Grant County, North Dakota.

Keith Payne, Chairman of Grant County Commission

Bill Koch, Commissioner

Don Roth, Commissioner

Fort Worth, Texas 76137

March 24, 2014

Dear Mr. Wheeler;

Here are some of my concerns about this massive expansion of the Powder River MOA

Why is the Powder River MOA expansion largely in Montana airspace when it provides no benefits to this state? Who wants it here? Senator John Thune!! To save Rapid City's Ellsworth AFB, which was scheduled for closure in 2005 by the DOD. It is against the law for myself to engage in communications directly with Senator Thune!! He can ruin my livelihood and I cannot even talk to him!!! SO-24

This expansion was supposed to save Ellsworth AFB/USAF $8 million in the 2010 EIS, but now it is magically $21 million this year? Even with this savings, how much more is it going to cost the USAF for additional training hours for crews, other AFB's, etc. to use this airspace? What is the total savings to the total USAF/DOD budget? It will increase the total cost to the military because of more training! I really question this data. The EIS from 2008/2010 is totally out dated and needs to be revised & updated to see these major changes in just a short time. You will then see how ridiculous this proposal is for the area covered by this unjustified expansion. SO-14

If this expansion of the Powder River MOA is allowed, citing data from 2007-2008 Montana Economic Impact of Airports Study, this MASSIVE expansion will jeopardize 95 jobs that generate over $1.5 million in payroll, $3.8 million in economic activity, in the communities that underlay this behemoth!! 39 airports and 285 aircraft will be very negatively impacted by this expansion. Now, do we need to 3 X our numbers as the USAF has done? It will become the largest MOA in the world, larger than the state of South Carolina!! It will be 4 1/2 times the size of the Nation of Israel. The current Powder River MOA is approximately the same size as Israel and they have some of the best pilots in the world! SO-5 PN-3

Page 1 of 7

137

The USAF is not being fully truthful about his expansion. During the EIS scoping meetings in 2010, the USAF said that it would have no impact on General Aviation. We could just share the airspace, 240+ days per year & up to 8 hours per day. The USAF said that it would not impact IFR traffic. (All jet traffic and inclement weather operations are conducted under these civil rules) IFR traffic is prohibited in an active MOA by FAR's! The USAF also has "Lights Out" night operations approved for the current PR MOA. I do not know how VFR civil aircraft will "see & avoid" unlit military aircraft at night. The USAF also said it needs this expansion to train in mountainous terrain to simulate Afghanistan operations. There are no mountains in this area! The mountains in Afghanistan have peaks over 24,000 feet high! The USAF is trying to slide this along, using questionable data, to maintain minimal resistance/input form the civilians & general aviation. Why are electronic comments not accepted when we have search related issues on-line? Most other comments are accepted this way. You are just trying to make it difficult!

AM-21
SA-11
PN-2

In the "BACKGROUND" section of proposal 14-AGL-06NR, it states that the "Doctrine for modern warfare" has changed dramatically. If you follow the logic proposed, there is no reason for low-level operations to be conducted as "weapons can be employed form well beyond visual range with great precision". On page ES-14 of the Powder River Training Complex EIS Executive Summary, Dated August 2010, Alternative A, it states that civil aircraft pilots do not rely on IFR below FL180. This statement is simply not true! Considerable traffic is conducted under IFR rules below 18,000 MSL. Many pilots all do not fly jets, turbo-charged, or pressurized aircraft, and are not even able to fly above FL 180. It also states that pilots could fly VFR until outside the MOA then go IFR. FAR Part 135 prohibits such action without radar coverage.

PN-3
AM-21

Ellsworth does not have an impeccable safety record. The have had two B1's crash in the current PR MOA, Sept 1997 & Aug 2013, one with 4 fatalities. The B1B is extremely expensive to operate as it requires about $1 million in maintenance for every 12 hours of flight time. How long will the USAF even be using this antiquated aircraft, given the extreme operational costs? The USAF wants Minot AFB to bring their aircraft to join in the use of this area. It is approximately 5 times the length of flight to the PR MOA as it is for them to use Tiger & Hays MOA that already exist. There are only 65 B1's left and they have not seen combat duty since 2011. The B52's are a Vietnam era aircraft with only 85 still active. They have not seen combat duty since 2001.

SA-20
SO-14
PN-2
PN-3
AM-6

When this airspace is used for RED FLAG operations 10 days a year, pilots from all over the world will be flying in this area, FULL SCALE WAR GAMES!!! This is ridiculous!!! To have this type of operation over populated areas will create extreme safety hazards to the people, residences, & cities that underlay this area, given the safety record of Ellsworth's AFB operations & the B1B. Where is the respect for Montanans?

SA-20

Many things have changed in this energy rich area since 2010. In Baker alone, we have a new multi-million dollar fire station, a brand new motel, and Montana Highway 323 is now completely paved & has significant use tying us to the commerce area of the Black Hills of South Dakota. Oil production is at an all-time high. The EIS from 2008/2010 is totally out dated and

Page 2 of 7

137

needs to be revised & updated to see these major changes in just a short time. You will then see how ridiculous this proposal is for the area covered by this unjustified expansion.

The FAA has spent over $15 million on Baker Municipal Airport. KBHK will not survive this expansion. KBHK has new VNAV approaches, scheduled for publication in late summer. How can you even use these when we have 2000AGL-3mile radius airspace protection when the USAF plans to shut us down 240 days a year? SO-10

The main mode of transportation for oil executives, engineers, & personnel to Baker, MT is by private aircraft. Do we really want restrictions placed on their travel to this remote area? Bowman, ND is currently building a brand new airport. Close to $20 million FAA ADAP funds have been spent on this airport. Why? It will not be able to be used to its full potential if this airspace is expanded as proposed. FAA will be held accountable for the waste of tax payer's dollars for this airport's development & construction. SO-17

Some of the current users of KBHK and the surrounding area with jet/tubine powerd aircraft are Denbury Resources, Continental Resources, Hiland Partners, MDU, Edwards Jet Center, Choice Aviation, Richland Aviation, JCam, Denver Air Center, Holiday Stations, Lufkin Industries, & Executive Air Share. Many of our arrival flights from Texas & Oklahoma arrive between 8 AM and Noon, Monday thru Friday, but the USAF says minimal impact if the MOA is active. Proposed hours for MOA scheduling during Monday through Friday are designed to provide times when the MOA would not be activated to support civil aviation. Who came up with this idea anyway? No airport managers in this area were consulted to find when peak IFR traffic times were. Again, not true! This would be the worst time to close our airspace to civil traffic. These impacts are unacceptable. This type of passenger does not choose this mode of transportation to be delayed. Again, this expansion does not belong here, especially PR Area 3! AM-21

According to the latest FAA records, there are currently 54 US registered aircraft in Fallon County, most of them based at KBHK. Included in this number are four jet-powered Cessna Citations (Continental Resources & Trans Western Transportation) that are used by local oil & gas companies to transport people on a regular basis.

Highland Partners operates a Cessna Citation XLS in this current airspace on almost daily basis. The cost of these operations will increase by $70,000 per year alone by implementing this airspace expansion. This expense is for just one of its aircraft. This group of companies own and operate three jets, used to service this area. SO-7

This is extremely costly to these energy related companies and costs our airport fuel sales, tax revenues, & general losses of revenue. Safe operations of these hi-speed aircraft will also be compromised. SO-6

This proposal is in direct conflict with KBHK Airport, as well as other airports, Airport Influence area zoning regulations. These regulations were designed and implemented to protect this airport and its airspace. There are no provisions for IFR flights in/out of KBHK, using the new VNAV Instrument Approaches that are currently being developed for KBHK. 2000 AGL with 3 AM-5 AM-21

Page 3 of 7

137

mile radius does not get you even close to IAF's, intersections, etc. of the approaches. In December 2013, I hired a new FAA Certified Flight Instructor. We have also purchased a training aircraft and currently have six primary students. We have a growing list of potential new pilots. How can a flight school operate safely at this airport? AM-21 SO-6

I know that ATC only looked at IFR radar covered traffic when compiling dated. What about all the cruise clearances, flights below 18,000 MSL, etc. that have destinations under this area. We need radar & communications to the surface if this is going to provide a safe flight environment. AM-3

General aviation has a difficult time operating IFR or VFR (with flight following) in this area already because of poor radio communications and lack of ATC & weather radar. It is an area where three ATC Centers meet, SLC, MSP, & DEN. V-120 has an established MEA of 10,000 MSL. Radio communications with ATC are not available until reaching an altitude of 8,000 to 16,000 MSL in this area with radar coverage limited to 10,000 to 18,000 MSL. There is really no data or impact assessment mentioned in the EIS or this proposal about aircraft with destinations into airports covered by this MOA. Increasing IFR traffic by jet powered aircraft into these airport destination is a major concern for scheduling and more important, safety. Jet powered aircraft are unable to operate VFR into KBHK due to operating limitations & insurance requirements. Without communications & radar coverage, this proposal will result in increased mid-air collisions and near miss situations. AM-3 SA-1

The oil & gas industry is the largest employer in Fallon County. Currently, the State of Montana collects over $50 million in oil & gas production taxes in Fallon County, over $20 million returned locally. Denbury Resources is the largest oil producer in Montana. They currently pay millions in taxes to Fallon County! Denbury Resources is the #2 taxpayer in the State of Montana! Denbury currently uses KBHK on a continuous basis, sometimes with multiple operations daily. I have been advised that Denbury will no longer use Baker Municipal Airport if this airspace is expanded as proposed. They operate under FAR Part 135 and will not be able to comply with FAA Regulations to continue operations. SO-17 SO-10

All the letter groups, including AOPA (approx. 400,000 members), EAA (162,000 members) & MBAA (over 10,000 company memberships which earn $5 trillion dollars annually) are fighting together against this expansion. AOPA has labeled it "UNJUSTIFIED" It will become a very hot topic at election time if it moves forward.

There are numerous pipelines that underlay this proposal. How are the pipeline operating companies going to comply with DOT inspection regulations? A considerable part of my livelihood comes from aerial pipeline patrol flights!! Recently, August 2013, when the last B1B from Ellsworth crashed, I was unable to fly one of my routes for over a month. The USAF commandeered the airspace for a 15 mile radius around the crash site by issuing a TFR, no fly zone! This cost ME time & money!! It almost put the pipeline operator in violation of DOT regulations. DOT regulated pipelines are required to be inspected at intervals not exceeding 3 SA-7 SA-21

Page 4 of 7

137

weeks, but at least 26 times per calendar year. Methods of inspections include walking, driving, flying, or other appropriate means of traversing the right-of-way. DOT 49 CFR 195.412 "Inspections of rights-of-ways and crossings" SA-7 SA-21

If you sense an angry tone in this letter, you are correct! My livelihood is at stake for something that does not even belong the "BIG SKY COUNTRY" of Montana. I have owned and operated Baker Air Service in Baker MT for over 35 years, since in its inception in May 1978. We currently employ 5 people with plans to add 2 to 3 more positions by the end 2015. If the Powder River MOA is allowed this massive expansion, we will be forced to cut our work force and sell aircraft immediately. It will be impossible for Baker Air Service to continue on its business plan for the future, as there is no way pilot training, charter operations, & transient aircraft can use this airport safely. Most of our operations are beneath this proposed expansion. There is little chance this airport will survive. Baker Air Service will lose up to $1 million in revenue annually in the near future, as this business will be un-able to grow with the energy sector because of the limitations of this proposal. SO-6 SO-10

What will be done to mitigate the circumstances associated with the chaff cloud produced by the military using RR-188 aluminum coated silica on June 4, 2013 in Huntsville, AL. The National Weather Service thought it was a pop-up thunderstorm!! This creates undo stress & concerns to the general public. How will this affect civilian aircraft on-board weather depiction systems? SA-16

What will happen to the animals at private game farms when multiple sonic booms occur in rapid succession during training exercises, ***especially during the LFE's***? Deer, Elk, and other species may be adversely effected. Buffalo will probable stampede through fences & be injured and or killed. Studies have shown that conception rates, under this type of activities, are significantly lower. Have any of these operators been contacted? There are concerns for the Sage Grouse, as they may be adversely affected by increased military traffic, especially the LFE's. This impact has not been fully addressed, because the Sage Grouse core study area is under the existing PR MOA. No studies were conducted before the moa was established. It is a valid concern, as it will have a negative impact to all wildlife. This must be taken it to the US F&W for their assessment of the negative impacts. BI-4 SO-9 SO-27

The cities that lay beneath this airspace will be at risk for public safety. There is no reason to have this type of activity over a city or even residences FAR 91.119 prohibits aircraft operation @ 500 AGL over congested areas. 91.119 (a) Minimum safe altitudes – Can these aircraft make an emergency landing safely if a power unit fails without creating an undo hazard to persons or property on the surface? I see no restrictions in this proposal to identify compliance with FAR 91.119. Two B1's have already had uncontrollable crashes in the current Powder River MOA. SA-20 SO-27

What about IFR operations in uncontrolled airspace? There are no takeoff minimums for aircraft operated under FAR Part 91. Also, FAR 91.177 2 (ii) requires only 1000 feet above the SA-1

Page 5 of 7

137

highest obstacle within a horizontal distance of 4 NM of course flown. How safe is that in a "hot" MOA? SA-1

Other FAR's in question FAR 91.117 Aircraft speed. FAR 91.209 Aircraft lights - the current MOA allows "lights out" operations. How does a civilian aircraft see and avoid an un-lit military aircraft at night? FAR 91.303 Aerobatic flight. None of this is addressed in the current proposal. SA-11

These are significant and important factors in the VFR "See & Avoid" concept. I know that the military accepts this responsibility, but when you are dead from a mid-air collision, it really doesn't matter who was at fault! GE-5

I realize that the USAF is above the law, but when their operations are conducted in the same airspace as civil aircraft, there is a direct conflict and safety will be compromised. There will be a significant increase in near miss situations, mid-air collisions, with an increase in fatalities. SA-1

On February 25, 2014, I spoke with a military pilot that had recently flown in Afghanistan about this proposal. He said that there are no restricted areas in this MOA to drop ordinances, so the airspace expansion of this magnitude is not needed to train properly. He also said that "Red Flag" operations should be done over non-populated areas as things can go wrong! He also stated that combat flights do not typically fly less than 6000 AGL as the aircraft will be shot down by ground fire. Why is the floor of this expansion at 500 AGL? There are absolutely no justifications for the 500 AGL operations! I have since spoken with several other ex & current military pilots that agree with these assessments. Also, all of them concur that rules will not be followed, especially with the chaff and flares, as pilots are instructed to succeed on all missions. Do what it takes to get it done! PN-3

After reading through this proposal, I see absolutely no concessions/mitigations in Powder River 3 MOA, despite our previous comments & objections. Senator Max Baucus & Senator Jon Tester both expressed their concerns on the EIS & sent letters of objection to the USAF. Did you even receive the comments? I cannot seem to find them, even though they are considered public information.

Also, the PR MOA 3 is advertised as North Dakota when over half of it is in Montana. Another deception by the USAF. Why are the comment going to FAA Central Service Center when Montana Airspace should be handled by the Western Region? Trying to sneak it through!!! It will cover almost 20% of Montana's airspace in addition to the already existing HAYS MOA! GE-5

This whole expansion is absurd the way it is being handled. Why is this expansion necessary if the military budgets are being cut & troops being sent home? It needs to be killed right now & quit wasting tax payer's dollars on something that does not benefit Montana and will not save a damn dime on the overall military budget. Might save Ellsworth but going to cost more to bring other AFB' to this area, including Minot AFB. Who is the USAF trying to con anyway? You do the math!! GE-3 PN-3

Page 6 of 7

137

How many additional things in the future? More airspace, ground troops, etc. Restricted areas next? Drones?? Where are the restrictions?

One major problem is the USAF never flies <500 AGL!! I have to call "bullshit" on this one, as I have witnessed operations below 500 FT AGL several times myself in the existing Powder River MOA. Recently during an open house at Ellsworth AFB, I inquired what the little gauge in the lower RH instrument panel of a B1B Lancer set on "1" was for. It controls the ground proximity flight system. 1 equals 100 Ft AGL, but dial must have "gotten bumped" as the USAF never flies that low! Call any rancher that underlie the current PR MOA and they will tell you of their own experiences. You have that on record, as several of these ranches have made comments! I have one rancher that contacted me about selling his Piper Super Cub because he will never fly it again. He had a very close mid-air with a B1 in the current PR MOA. Kind of sad as this aircraft was purchased by his father as a new aircraft from Piper Aircraft in 1950. Who is going to monitor altitudes? Is the fox going to guard the hen house???

GE-5

SA-1

What about jet fuel smoke toxicity generated at low levels. What are the effects on fish & wildlife with the chafe, flares, & etc? How will it affect commercial radio broadcasts, Satellite TV, Cell phone coverage? What effects on veterans, especially with PTSD, with the increase in flights, sonic booms, flares, chafe, & LFE's? Ft. Meade VA Center, Sturgis, SD lies between Ellsworth AFB & the PR MOA!!

BI-4

Unburned flares & chaff canisters are a concern. What if a small child gets a hold of one of these that has not deployed properly & discharges it? What is going to happen to the kid who takes it to school? Probably be charged with terrorism!!

SA-5

Baker's current population exceeds 2000 people and is rapidly growing. A 600 person "man camp" has already been constructed in Baker, MT and is ready for Keystone P/L construction when it goes. 2600+ people in one city alone under LFE's!!

Bad Data = Bad Decisions

You have some bad data and there are a lot of unanswered concerns here!

We are not getting consistent information & messages from USAF or FAA.

The "No Action" alternative is the only logical decision to this expansion proposal.

I have also enclosed copies of letters from our elected officials for your review on this matter.

In closing, I want to know where to send the bill for my lost revenue if this ridiculous proposal is implemented, as I will not be able to conduct an aviation business safely in this environment.

Roger D. Meggers, President

Baker Air Service, Inc.

RE: Proposed Expansion of Powder River MOA

Dear Sirs:

I am opposed to the Air Force's proposed expansion of the Powder River Military Operations Area. It unfairly penalizes other aviation users in the area and land holders under it, while providing no improvement in the Air Force's overall readiness for its missions, which are no longer focused on the Cold War. GE-3

Since 1976, I have been flying general aviation aircraft in this area and it has its own beauties and challenges to piloting. It is an arid environment that is sparsely populated with humans, but those humans that are there are able to make their livelihood coping with the challenges of the area. The Air Force would disturb their ability to make that living, while not compensating them for their loses. SO-5 The proposal to drop chaff and live flares, potentially damaging the environment and starting prairie fires is unacceptable. SA-5

For example, in the last year a B-1 did crash in the current small version of the MOA causing some small fires. It was at least one and a half hours before the Air Force from Ellsworth AFB was able to arrive on the scene. Without the local ranchers responding as the emergency crew, fires could have spread and the crew might have suffered greater injuries. During the era of missiles at Ellsworth AFB they had a helicopter unit that could have responded in a timely manner. Today that does not exist. To expand this area to more than four times it current size puts more people and their property at risk. SA-20

I visited the Air Traffic Control facility at Ellsworth a couple of years ago when this was first proposed. The controllers agreed that there is limited coverage in the area, with radio and radar AM-3

138

coverage not really covering anything under 3000' AGL. That means that all civilian aircraft in the area would have no way to keep track of potential hazards in a timely manner. AM-3

When B-52s were based at Ellsworth, I was fortunate to fly along on a mission for the day. It consisted of a variety of exercises, including low-level. They used "oil-burner routes" that were not in a MOA for their low-level exercise. It was disconcerting for the pilots to say to me, "keep an eye out for air traffic while we are at 500 AGL, we will be busy looking at our instruments and not outside the aircraft." Since I was sitting in the IP seat, I was the only one available for visual observations. I assume the lack of looking outside of the aircraft has not changed in the subsequent years. SA-1

The Cold War is over. Even during that period the Air Force was not asking for this huge amount of airspace. They flew smart with areas like the current Powder River MOA and oil-burner routes that were shown on sectional charts. The United States is faced with new challenges in how it prepares for war. As much as I love airplanes, someone needs to tell the Air Force the days of manned aircraft are numbered because the nature of their mission has changed. While the Air Force continues to try to adapt its bomber fleet to meet these new challenges, the costs are not in line with the supposed benefits. The impact on Americans and their property is disproportionately unfair to those who live in the proposed expansion area. PN-3

The FAA's mandate is to promote aviation for all Americans, not the American military. You need to give the Air Force the message that they need to fly smarter, not spend more money. They also need to respect the rights of all Americans.

Sincerely,

Norma J. Kraemer

March 24, 2014

Manager, Operations Support Group
ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department Of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Dear Sir:

As a corporate pilot for the True Companies based in Casper Wyoming I am compelled to address my displeasure towards the Powder River Military Training Complex expansion.

Disruption of private and commercial flight operations within, without, and along the periphery of the proposed area will be a reality and not just a possibility.

The PRTC is located to the south and southwest of the largest oil discovery in the United States in many years, additionally subsequent energy discoveries have sprang up within the proposed airspace. Both, private and commercial operators who support the energy industry use this airspace daily performing flights that commence and finish within and outside of the described borders.

With the proposed increase in actual size and usage the PRTC will hamper our operations. While the Air Force touts the benefits of fuel savings it will be the reverse for us and others. An active MOA of this proportion will force companies such as ours to navigate around the airspace to get to our destination. Every flight that proposes to transit or land within will have to sacrifice payload for additional fuel. More flight time, up to 2 hours on a round trip correlates to increased maintenance costs over a chronological period. On time reliability and efficient usage of aircraft are important to an operation such as ours. Our costs are our responsibility and not the taxpayers.

SO-6
SO-7

Corporate aircraft used in the support of companies like ours are an amazing tool if used correctly. A typical flight for us leaves at 7AM and arrive back home 12 hours later. Inside this aircraft you will find varying professionals from engineers to attorneys, the IT folks and field hands up to nine at a time. Without an aircraft this twelve hour day becomes three days, two of travel and one on the job, costly and very inefficient. You can only imagine the costs on a per day basis for one employee. Salary, lodging and meals at a minimum.

Can we just build this extra time into our schedules? NO! We purchase our costly aircraft with specific profiles to be as cost efficient for our needs as possible, operating beyond this profile is a waste and destroys the purpose of purchasing this asset. Can we be more willing to adjust to the active or non active status of the MOA? Historically, the answer is no. Communication from the operating agency the

141

Air Force and ATC is poor to say the least. It is very unnerving to be in cruise and when within a few miles of a MOA be told to turn 75 to 90 degrees off course since the MOA has now become active. Would I prefer flying through the MOA VFR? NO. Fuel burns are higher at lower altitudes and passenger comfort is compromised significantly from turbulence. Most of all, flight safety can be challenged. The possibility of a mid air collision is magnified within a MOA and an increase of overall size push's the exposure percentage to a higher level. GE-5

In conclusion I sense that the American public is getting a slick sale in the name of patriotism. We are only a small piece of those who will be challenged. Ranchers will fight with noise issues, lost production of live stock, fires and more. Fixed BASE Operations within the MOA may cease business as an IFR situation will make their airport unusable. Others can be discussed. SO-5 SO-6

Knowing full well if this airspace is established, Bomber wings and fighter wings from throughout the world will now find their way to the Powder River Training Complex completely defying a core principal of the initial PRTC needs as defined by the Air Force and that being savings via reduced fuel consumption while additionally increasing the usage of the airspace magnifying the suffering imposed on flight operations such as ours.

Sincerely,
James Wade Bergslien

[redacted]

[redacted]

Dear Secretary James and General Welsh;

We are writing to express our continued opposition to the Air Force's proposal to expand the training airspace for Ellsworth and Minot Air Force Bases; into a larger area of southeastern Montana. To expand the Powder River Training Complex to 28,000 square miles would negatively impact our environment.

We are located 250 miles from any major medical facility; when seconds count in saving lives, we rely on our EMS Life Flight Services to transport patients 24-7-365 to Rapid City, South Dakota, Bismarck, North Dakota and Billings, Montana. This expansion would not only affect our Life Flight Services, it would also affect 33 Community Airports containing 285 general aviation aircraft that support our daily livelihood. SA-19

There are numerous Oil and Gas producing companies in this area, there are weekly flights in and out of these Community Airports checking progress on various pipelines, Oil and Gas related projects.

We are also concerned that the use of live flare and chaff release could cause wild fires that endanger lives and property. The EIS does not provide a plan for responding to these fires. SA-5 AM-3

Furthermore, flights that break the sound barrier and fly as low as 500 feet stress area residents, livestock, wildlife and sage grouse. Once again, there is no proposed remediation plan for land and livestock owners in the affected area. NO-2 BI-3

We appreciate the opportunity to comment on this proposed expansion, please take into consideration the impact it would have on our daily lives.

Sincerely,

Fallon County Commissioners, Baker, Montana, USA.

Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth, TX 76137

Dear Manager,

I am writing to you as a pilot, rancher, volunteer firefighter, and concerned citizen. The Powder River Training Complex that is proposed for southeastern Montana, is a terrible mistake and we don't want it. We have vast open spaces here-mainly agricultural and oilfield. As a result of this, many of us fly airplanes. We fear what this training complex would do to our ability to fly over our ranches to check our cattle or fly our pipelines to inspect for leaks, but most of all, what it will do to our ranches and way of life. The Air Force and Senator John Thune are not taking our rights and freedoms into account. Montana should not be held responsible for keeping Ellsworth Air Force Base open.] AM-21

I want to make the point that most everyone within the area of this airspace expansion is patriotic and is proud of those who serve, or have served, in our military. We all want to make sure that our military has the necessary means to protect and defend our freedoms. But they also have to realize that we have to protect our freedoms as well. We are protecting our freedom to fly our aircraft to monitor our land and livestock. We are protecting our livestock from being startled through fences by sonic booms. We are protecting our grasslands from wildfires started by deployed flares and chaff. We are protecting our rural airways to allow emergency flights to transport our injured citizens from accidents or rural hospitals. We are protecting our land values which will be decreased by military operations in this area. We are also protecting our commerce by allowing the many flights of private and corporate aircraft into our small airports.

The Air Force has tried to assure us that none of this will be an issue. But it will be. Aircraft operators flying under VFR (Visual Flight Rules) are told to see and avoid any aircraft in the area. Have you ever tried avoiding something coming at you at 500mph? It is not only hard to see, but you have very little time to react when you do. Those of us who use aircraft on our ranches will have to be especially vigilant whenever we are up in the air. Air ambulance flights have been assured that any military operations will be shut down in the event that an emergency flight has to enter the operations area. This isn't something that can happen with a flip of a switch. This all takes time, which in an emergency, you don't have a lot of.] AM-14] AM-12

On these military training missions, bombers will be permitted to release chaff and flares from their aircraft which they say will disintegrate before reaching the ground, but on rare occasions may reach the earth. They have no mitigation plans for controlling wildfires, so guess who will be responsible for] SA-5 AM-33

143

extinguishing them? The landowners and local firefighters will be tasked with that burden. This doesn't even address the loss of grass for our cattle. Just ask all of the landowners who lost thousands of acres of their grassland to wildland fires in the past several years how devastating that can be!

The Federal Aviation Administration has recently sunk tens of millions of dollars in runway expansions and airport improvements within this proposed area. This will end out being an enormous waste of government funds if aircraft are not able to freely operate in and out of the area. As you know, when a MOA is active there are certain areas within that airspace that are completely off limits or can only be entered during certain times of the day due to supersonic aircraft being in the area. Other areas have a floor and ceiling so you can fly either above it or below it (with extreme caution). These aircraft are not to be any lower than five hundred feet above ground level. That's not very high! For the most part, these areas are extreme danger zones when they are active. Bad thing is-they are active, in many instances, for more than eight hours a day and at night. How great will that be to get startled out of bed by a sonic boom at eleven o'clock at night? Also, we will never know if a certain area is active or not without calling air traffic control every time before we fly. This is not always possible due to poor radio coverage in our area. It is just not a safe situation.] AM-3

I could go on and on, but the main point I want to get across is that we don't want this Powder River Training Complex in southeastern Montana. It will be detrimental to our land, our communities, our commerce, our safety, and our wellbeing. We have enough to worry about in the ranching industry without having to be worried about getting knocked out of the sky by a B-1 Bomber. This is truly a threat to our freedom to do what we love. I ask you to please deny the request to make this Powder Training Complex a reality.

Sincerely,

William D. Lane

Airspace Study 14- AGL- 06NR- Powder River Training Areas

From: Concerned Pilots, SW North Dakota

We the SW North Dakota Pilots Association members are very concerned about the proposed Powder River Training Areas. As you may know, western North Dakota has gone through a great change, with the oil activities, associated with the Bakken, Three Forks, and Williston formations. New high paying jobs are increasing, populations climbing, air traffic in double digit increases, and many airports upgrading and expanding to meet the needs of these energy companies. In fact, our local airport is moving to accommodate this increased need. Now we may be faced with many altitude, navigation, operational restrictions associated with the proposed Powder River expanded areas!!

In our view, we gain nothing (no fuel sales, maintenance income, hangar rent, no income to hotels, restaurants,dealerships, etc.), but we are stuck with the proposed low altitude (500' AGL), navigation, gap, and operational restrictions?? Not to mention flares (fire potential), chaff (surface water, livestock affect), low flying fast aircraft (safety issue) and noise? We feel the areas will deter aviation business (who wants to mess with restrictions), and move our income potential to other airports outside the MOA???

SO-5
SO-6

If South Dakota (Ellsworth AFB) wants a larger area, move it to South Dakota!! If North Dakota (Minot AFB) wants an area, go east to the Tiger and Devils Lake MOAs already in place!! Seems like Ellsworth and Minot get the income

PN-2

144

and we in southwest North Dakota get nothing??

We support our men and women in uniform and support training, but there seems to be no compromise to benefit our airport and community??

A few recommendations, we believe, would greatly reduce the training area impacts-

1- area relocation is probably out of the question

2- raise the area (3) floor to something higher than 500' AGL, small aircraft could go under, large aircraft could go over (FL 180)] PN-4

3-have a direct telephone line to a military training office to have instant updates for pilots, flying near the areas (other than Flight Service Stations)] AM-12

Thank you for your consideration.

Concerned Pilots

Rodney Schaaf
S.W. No. Dakota Pilots Association Director

Airspace Study 14-AGL-06NR
Department of Transportation'
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

To Whom It May Concern:

It has come to our attention that there is AGAIN movement to put the Powder River Training Complex into play. It has not been very many years ago that this met with a resounding NO from the ranchers and others in this highly rural area.

Please realize that this rural area is the livelihood of many people and the use of the air space above us by low flying bomber runs, sonic booms, flares and chaff etc. will have a very adverse affect on our ability to carry on our operations.] SO-6

Cattle spook and run at the sound of sonic booms, often times through fences, getting cut up and remain nervous for some time to come, thus not grazing and gaining as they are meant to do. Also if we are working a cattle and a sonic boom happens, our horses go crazy which could easily cause a big wreck and a rush to the hospital.] BI-4

We would like to know what, if any, is the mitigation plan to compensate the rancher for the losses and costs he may incur for such accidents, or for the burning of his rangeland should some chaff hit the ground before disintegrating? Are the Powers that Be prepared to guarantee payment to the ranchers for the loss of pasture if a wildfire should occur or the loss of cattle due to injury, or a hospital bill due to a bucking horse?] SO-12

Other issues involved also include the use of air space by our locals and oilfield . It is a common practice for many of our ranchers to fly over their cattle, checking water, etc. Are they going to be notified every time a training flight is to be in their area? What about the jets that fly in and out of here with oilfield people? Are they to be notified? What about emergency medical flights that take place frequently from our airport? Are they to be put on hold until the bombing runs are completed?] AM-12

We have said it before and we are saying it again. This is not a feasible plan for anyone

145

in this area and we are still saying NO.

Sincerely,

Marvin & Sharon Gookin

From: Little Missouri Grazing Association

We the members of the Little Missouri Grazing Assoc. are very concerned about the proposed Powder River Training Areas. As you may know, western North Dakota has gone through a great change, with the oil activities, associated with the Bakken, Three Forks, and Williston formations. New high paying jobs are increasing, populations climbing, air traffic in double digit increases, and many airports upgrading and expanding to meet the needs of these energy companies. In fact, our local airport is moving to accommodate this increased need. Now we may be faced with many altitude, navigation, & operational restrictions associated with the proposed Powder River expanded areas!!

In our view, we gain nothing (no fuel sales, maintenance income, hangar rent, no income to hotels, restaurants ,dealerships, etc.), but we are stuck with the proposed low altitude (500' AGL) restriction!! Our concern is what effect low flying, loud aircraft will have on livestock production? Another concern is fire potential from flare drops! Will " chaff" pollution affect our surface waters that our livestock drink?? We feel these "low areas" will impact farmers and ranchers, and any business interests will avoid our area and move income potential to other communities outside the MOA???

SO-5
SO-6

If South Dakota (Ellsworth AFB) wants a larger area, move it to South Dakota!! If North Dakota (Minot AFB) wants an area, go east to the Tiger and Devils

PN-2

150

Lake MOAs already in place!! Seems like Ellsworth and Minot get the income and we in southwest North Dakota get nothing??

We support our men and women in uniform and support training, but there seems to be no compromise to benefit our operations and community??

A few recommendations, we believe, would greatly reduce the training area impacts-

1- area relocation , or area # 3 a "high area" — DO-4

2- raise the area (3) floor from the 500 foot above ground restriction to 8000 feet. — PN-4

3- if need the 500 feet restriction, use it 1 day/week instead of 5 days/ week.

4- A direct telephone or web contact, to military training center, for instant updates, to work around livestock operation schedules. — AM-12

Thank you for your consideration.

Fort Worth, TX 76137

Dear Federal Aviation Administration Decision-makers:

I am writing in opposition to the expansion of the Powder River Training Complex.

The Draft EIS describes the impacted area as "primarily rural and uninhabited in character." This disrespects the land where we get our meat and grains. The outdoor needs of rural people and farmers and ranchers are necessary on a daily basis, and should not be disrupted with various dangers 240 days out of the year between 7:30-12:00 am. and 6:00-11:30 pm. with a possible ten flights during three hours per day and two flights during six hours per day, plus additional gap flights.] PN-5] AM-6

Please continue using the existing SUA sites in Nevada and Utah, perhaps expanding those sites as needed. Exploiting a food source area is not an appropriate use of the land.] PN-7

It's also not in the best interest of the public when it is known that "modern air warfare has changed dramatically" and the public knows that drones are replacing traditional air defense.

Please do not expand training in this particular area.

Sincerely,

Matthew Kammerer

CARTER COUNTY COMMISSIONERS

[redacted]

****

May 1, 2014

Manager, Operations Support Group, ATO Central Services Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Gentlemen:

The Carter County Commissioners would like to go on record as opposing the expansion of the Powder River MOA.

A large portion of Carter County is already in a MOA; however the expansion would increase the size and include the airports at Ekalaka and Broadus. We believe this would have a significant impact on these airports as well as Ashland, Colstrip, Baker and Bowman ND.

We are very concerned with how this will affect emergency medical flights. Ekalaka is 150 miles from the nearest major medical center. Depending on the severity of the illness or injury, a small amount of time may be the difference between life and death. SA-19

Our local pilots have learned to deal with the situation but it is unclear how major war games may impact them. The use of flares and training chaff is also an area of concern relating to starting fires in remote areas. SA-5

We are not anti-military and believe a training area is necessary. However, we think that as a minimum, Powder River #3 should be eliminated or significantly modified. There is a tremendous amount of oil activity which would be disrupted by this expansion.

This expansion, if it does occur, should include significant expansion of air traffic control measures. Air traffic control radar sites need to be developed for the safety of all air traffic within the area. AM-3

Finally, the economic impact of this expansion should be looked at carefully. Millions and millions of dollars have been spent to improve the small local airports that may be compromised severely if this expansion goes through

Board of the Carter County Commissioners:
James E. Courtney, Chairman Steve Rosencranz Luther Waterland

162

Operations Support Group Manager, AJV-C2

Airspace Study 14-AGL-06NR

May 1, 2014

Dear Sir:

We oppose the Powder River Training Complex. We ranch near Ekalaka, MT and use a small plane checking livestock, water, and for predator kills so we feel our property rights are violated when the government restricts our use over our own land. The legislators from SD are pork barreling money for SD. Let them have the training area over the bad lands of SD. The Pentagon should make airbase decisions, not the legislators.

RE: Proposed Expansion, Powder River MOA

TO: Whom it may concern

Although I am the owner of a FBO at the Bismarck Airport, I wear many hats in the Aviation Community from that of small aviation business owner, pilot, flight instructor, ag pilot, to Unmanned Aerial Systems Test Site representative, I have many concern about this airspace request, the first being **SAFETY** and the second economically.

Western North Dakota is experiencing growth in numbers not seen in recent history. Not only is the oil boom affecting air travel in proposed area but also is agricultural aviation with the development of genetically altered crops and the commodity prices. These crops have a greater need for pesticide application in a timely manner.

This being an area of poor communication coverage and even poorer radar coverage it will be impossible to see a majority of the aircraft that are proposed to be training in the area. With the concentration of agricultural operations and the frequency of flights into the underlying airports, the potential for conflict increases exponentially.] AM-3

The economic effect could be devastating on the communities that underlie this proposed expansion area. The delaying of pesticide operations and the restriction of flights carrying sportsman in and out can cripple the two very industries that are the life blood of these small rural communities. Medical flights are essential to these communities and although promised priority handling, due to the poor communication and radar, will be delayed because of this expansion.] SA-19

I recognize and support the need for our defense system and recognize the importance of good and frequent training. I also recognize the track record of the Military has not been up front with their intentions with these airspace acquisitions in that what they say they are going to do is completely different than what they actually what they do once they control the airspace.

If the issues raised above were not a valid concern, South Dakota would have offered more of their airspace, the airspace that is south and east of Ellsworth Air force Base.

This proposed expansion is not in the best interest of the FAA, General and Commercial aviation and the economy of the communities that lie below this proposed area.

Thank you for your time and consideration in this matter

Sincerely,

Bob Simmers
President

BROSZ ENGINEERING, INC.
ARCHITECTURE ENGINEERING SURVEYING

May 2, 2014

To: Manager, Operations Support Group

Airspace Study 14- AGL- 06NR- Powder River Training Areas

RE: Bowman Regional Airport

As you may know, our community has undergone great changes on account of oil exploration and production activities associated with the Red River, Bakken, Three Forks, and Tyler formations both in and near the Williston Basin.

The population growth in the area as a result of the oil generated economic growth is anticipated to increase air traffic considerably in the area. Many airports are upgrading their facilities to meeting the needs of the energy sector.

The Bowman Municipal Airport will be relocated east of Bowman, where the new Bowman Regional Airport is currently under construction. The need for a new airport has been dictated due to geometric constraints at the existing site that prohibits expansion. The Federal Aviation Administration, North Dakota State Aeronautics and the Bowman County are investing nearly $16,000,000.00 to construct the new facility.

The thought of having a new airport adversely impacted by new flight restrictions including altitude, navigation and operational restrictions associated with the proposed Powder River expanded area would be devastating to this new facility.] AM-5

This could drastically hamper the use of the new facility and the ability for the local authority to generate any revenue from fuel sales and hangar rentals.] SO-7

It would not only have a negative impact on the airport authority, but would adversely affect local businesses that may otherwise benefit from the increase in air traffic.

Bowman, ND • Pierre, SD • Sturgis, SD • Sioux Falls, SD • Stanley, ND • Winner, SD • Eagle Butte, SD • White Lake, SD

164

Probably the largest negative impact that could result from Powder River's proposed flight restrictions would be interference with air ambulance runs. Southwest Healthcare Services, located in Bowman, ND operates an ambulance service that serves the tri-county area. SW Healthcare has patients that are in need of immediate care for critical health concerns that, upon stabilization, are transferred to Bismarck or Rapid City on a regular basis for acute care.] SA-19 SO-5

With the proposed low altitude (500' AGL), navigation, gap, and operational restrictions, the Bowman Community and surrounding area stands to suffer significant negative impacts.] AM-5

I would appreciate you giving consideration to discontinue further development of these restrictions for our area. If it is not possible to relocate the training area all together, please consider a couple of suggestions to reduce impacts from the training area.

1. Raise the area (3) floor to something higher than 500' AGL. This would allow for small aircraft to fly below and for large aircraft to fly above (FL 180)
2. Reduce the 500 feet restriction to 1 day per week instead of 5 days/week] DO-3

Thank you for your consideration.

Sincerely,

Gary Brennan, PE

Fort Worth, TX 76137

May 3, 2014

Dear Sir:

Following are my comments on the FAA request for further comments on the proposed expansion of the Powder River Military Operations Area (PRMOA). I have submitted comments to the DEIS on the PRMOA issues relating to flares, chaff, impacts on livestock etc. After talking to Dr. John Witucki via telephone, my understanding of this FAA request for comments is that FFA is asking for information on how the Air Force's proposed airspace changes, or lack thereof, affect our local flying operations. My ranch's summer pasture is located in Township 16 North, Range 2 East in Harding County South Dakota. This range is under the current PRMOA in South Dakota. The proposed expansion would place my entire ranch under Powder River 2 Low MOA, Montana. The proposed floor for Powder River 2 is 500 feet AGL. This is the same floor as proposed in DEIS.

I fly a 1947 Piper PA-11 to check livestock , pasture fences, predator control for sheep, mud bog for sheep and cattle and any other problems that happen that affect my ranching operation. This is the only economically feasible way for me to get this job done and I have been flying my ranch for over 20 years.

The same problems exist now as in the original proposal. When I was a student, I learned that wing vortices go down 900 feet below the elevation the plane is flying and move out at a 45 degree angle at around 25 knots. If I am flying my 770 pound PA 11 at 300 feet AGL and a B1 bomber overflies me at 500 feet (if they are actually at 500 feet), these vortices can easily wreck my plane. As someone who has real time experience in attempting to see and avoid B1s, I can tell you that when you are flying at 70 knots, they close on you faster than you can pick them up no matter how vigilantly you are scanning. In addition, B1's, I am sure by design, are extremely hard to spot when they are flying below the horizon. Here is the point. The FFA registry shows 28 airplanes registered to owners in Harding County SD. This airspace is not empty. I cannot operate safely, and the other pilots in Harding County cannot operate safely with military aircraft flying over them at 500 feet. Powder River 2 Low MOA, Montana must have a minimum floor of 1500 feet AGL. The Air Force cannot be allowed to ignore the safety of our local citizens.

] SA-7

Airspace Study 14-AGL-6NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Boulevard
Fort Worth, TX 76137

Dear Mr. Wheeler:

I am writing in regard to the proposed establishment of the Powder River Training Complex (PRTC) Military Operations Areas (MOA), North & South Dakota, Montana, and Wyoming.

The United States Air Force's (USAF) air space expansion request to the Federal Aviation Administration (FAA) would cover approximately four times the original MOA and affect airspace in North Dakota from Bismarck to the southwest corner of the State. Currently, the Powder River MOA is located primarily in Montana. The USAF request also includes the 5th Bomb Wing from the Minot Air Force Base, North Dakota as an additional user of the PRTC and suggests that expanded special use airspace (SUA) is required to properly train aircrews. As the FAA reviews the request and considers whether the USAF has justified the use of the current proposed airspace, there are several concerns that should be addressed before the Powder River MOA expansion is approved.

During the comment period in 2010, North Dakota citizens and the North Dakota Aeronautics Commission expressed concerns related to: airline and charter flight operations; air ambulance operations; aerial applicators; pilot training and instruction; radar/communication; aerial wildlife surveys and predator control; weather modification program; and local communities and airports. Although the current proposal includes some changes in response to previous comments received, there are concerns that still remain along with new concerns. Since the last comment period there has been an increase in aviation activity in the southwestern part of the state and as you know North Dakota was recently selected as one of six sites to test

600 E Boulevard Ave. • Bismarck, ND 58505-0001 • Phone: 701.328.2200 • Fax: 701.328.2205 • www.governor.nd.gov

166

unmanned aerial systems (UAS) for integration into the National Airspace. Both of these factors need to be considered as the FAA reviews the proposed expansion.

North Dakota's aviation system is an important resource to the State. To insure that the safe and efficient movement of people and products continues throughout the state and to those areas outside the state, I ask the FAA to make sure all concerns have been addressed. I also would specifically request that the FAA have additional discussions with the North Dakota aviation community and the North Dakota Aeronautics Commission prior to a final decision. Discussions should focus on the possibility of raising the floor of the proposed MOA airspace in southwestern North Dakota from 500 feet MSL to a minimum of 8,000 feet MSL for general aviation; and the possibility of mitigations to North Dakota if the airspace is deemed necessary. For follow-up please contact Director Kyle Wanner, North Dakota Aeronautics Commission, at kcwanner@nd.gov or 701-328-9650.

DO-3
DO-4
GE-5

Thank you for your consideration, it is my hope that we can work together along with the North Dakota aviation community to resolve this important issue.

Sincerely,

Jack Dalrymple

Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Gentlemen:

I wish to support the military; however the Powder River MOA proposal causes too much harm to the affected area. It would have negative effects on the local residents, economy, medical emergency services, medical services for remote areas, businesses, general aviation, airlines, airports, weather modification, and agricultural operators. Access to the Bakken oil field would be restricted as the majority of support flights are from the south and southwest.] AM-6 AM-12

As we have previously experienced in North Dakota, the segmented airspace of the proposal is a great idea. However, the military activates all of the airspace not just a segment. The proposal does not address the fact that an ATCA airspace will be activated above the proposed airspace, thus even turbine powered aircraft must go around and not over the 18,000ft height. This is a current practice above the existing Powder River MOA and at the Grand Forks Air Force Base.] AM-4

For the proposal to be implemented; radar and communications must be improved in the affected area. IFR traffic needs to be allowed into the local community areas, which means a floor of the airspace, must be at or above 8000ft. For all altitudes including the ATCA, the segmented system must be enforced, to minimize the deviation around the airspace. The airspace should not be activated unless aircraft are actually operating in the airspace and should be cancelled upon the aircraft exiting the area. The proposed blanket of 10 hours a day, five days a week; is impractical and not necessary when the proposal states approximate usage of 3 hours. This requires an enhanced notam system and other systems of notification of activation.] AM-3] DO-3

Is a quadrupling of Powder River MOA airspace really necessary?

As proposed, the Powder River MOA expansion has too many negative impacts on the states, residents, and communities which would underlay it.

Sincerely,

Larry Gebhardt

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth TX 76137

Dear Manager,

We are writing to express concern regarding an Air Force proposal to expand the training airspace for Ellsworth Air Force Base and the Minot Air Force Base into large areas of southeastern Montana. In our view, the plan to expand the existing Powder River airspace to create the proposed Powder River Training Complex (PRTC) will negatively impact the operations of the members of the Montana Petroleum Association (MPA) in the areas underlying the PRTC.

The MPA is a not for profit trade association that represents refining, transportation, exploration, production and related oil field service companies in Montana. We have a broad range of interests and represent those interests with Federal, State and Local governments. While the MPA is a staunch supporter of America's military and our veterans, we are concerned about this proposed expansion area of the PRTC.

We have two primary concerns: First, the expanded area will significantly limit access to airports within the PRTC by private aircraft, including the airport located in Baker, Montana; and second, the expanded area will complicate the efforts of our members to properly and effectively monitor an extensive oil, natural gas and CO2 pipeline infrastructure in the area. AM-12

It is our understanding that the proposed PRTC military operations area (MOA) will be active from 0700 to 1200, Mondays through Fridays and from 1800 to 2330 Mondays through Thursdays, and that it will extend from 500 feet above the ground to 18,000 feet. AM-6

We also understand that when the MOA is active, aircraft operating under instrument flight rules (IFR) are not allowed into that airspace, but that airspace is still available to aircraft operating under visual flight rules (VFR); however, there are no additional safeguards that provide separation of VFR civilian aircraft and military aircraft when the MOA is active. As you well know, mixing private aircraft and military aircraft flying at high speeds is not ideal and the safety practices of our members will not allow them to enter the area operating under VFR during these active times. As a result, under the proposed PRTC private aircraft can realistically only access the MOA during the hours from 1200 to 1800, Mondays through Thursdays, and after 1200 on Fridays. That is a considerable restriction! AM-20 AM-21 SA-7 AM-6

The proposed PRTC overlays the Baker Airport, a well-constructed facility that frequently accommodates jet traffic to the area. Baker is one of two key locations for our members technical and management staff in eastern Montana, and accessibility to Baker by private aircraft will obstructed when the MOA is active. Considering that already has the Hays-Lodge Pole training area exists in northeastern Montana, the cumulative effects of the restrictions in place with respect to the existing training area and the size of the proposed PRTC will be to significantly impact our members' operations. AM-5

168

2
Montana Petroleum Association
4/29/14

Montana is the 12th largest oil and gas producer in the United States, producing approximately 28 million barrels of oil per year. Most of that production occurs in the eastern part of our state. We have attached two slides that illustrate that production. Furthermore, the eastern edge of Montana provides a vital pipeline corridor to the north and south out of the Williston Basin. Much of the crude oil and natural gas liquids produced in the "Bakken Oil Fields" is transported by pipeline located along the eastern edge of Montana. Production occurs or is transported through three main areas inside the PRTC boundaries:

1. Elm Coulee and areas in Richland and Roosevelt Counties. Significant portions of gas and liquid products are transported south to the mid-continent.
2. Cedar Creek Anticline in Fallon County, has oil, gas and pipeline infrastructure.
3. Belle Creek in southern Powder River County is the site of a mature field that has been renewed with an extensive CO2 Enhanced Oil Recovery program.

Additionally, there are current and planned pipeline projects in the process of planning and construction in the Powder River/Carter/Fallon county areas, including the highly publicized Keystone XL project.

Consider that the southeast corner of Montana is estimated to contain over 300 million barrels of recoverable oil. That is an important resource to our Country, America's national energy security interests, to the State of Montana, and to the residents in the area. All of that resource in addition to the vast resource development in the Bakken is dependent on pipeline transportation. Daily aerial monitoring of the extensive pipeline network is part of our safety ethos and imperative to the citizens of Montana. Most of the monitoring in the area is done with small fixed wing aircraft flying at low level and based in Baker. The PRTC proposal will impact the ability of local service companies to provide that service which is critical to our environment, resident safety and to MPA member operations.

AM-6
AM-12

Besides our primary concerns, we are skeptical of the USAF analysis of the impacts of flare use and impacts to sage grouse. The State of Montana is finalizing a comprehensive conservation strategy for the sage grouse and we fear the PRTC will add additional stress that will result in more limitations to the ground activities. The potential of wildfire as a result of flare use could destroy habitat for sage grouse. If fire does occur to core area sage grouse habitat the damaged habitat will be scored as surface disturbance in the area and will limit other kinds of activity including oil and gas development. Based on comments from the USFWS, loss of habitat is the prime reason they believe sage grouse populations are declining. The Service also insists that reclamation to the sage brush steppe is very complicated and requires long time periods.

BI-3

Finally, you might consider a more detailed check of your analysis that sage grouse will habituate to occasional noise from low flights and supersonic activities. Noise abatement is a serious component to the federal agencies recommendation for activity in sage brush habitat and a component of the State plan. Our cursory review of your analysis leads us to believe that sudden and infrequent loud noise would be disruptive to sage grouse especially during spring mating activates that are so critical.

Regards,

David A. Galt, Executive Director
Montana Petroleum Association

Re: Objection to Proposed Establishment of the Powder River Training Complex Military Operations Areas, North & South Dakota, Montana, Wyoming

Our File No. 94-696-14

Dear Sir/Ms.:

I am a general aviation pilot from Bismarck, ND and write to express my objection to the above-referenced MOA proposal. Like many general aviation pilots, I frequently fly in the affected area. Frankly I am appalled by the proposal, specifically the large area covered, the floor of the area, and the active times. As a practical matter, it closes down the entire region to general aviation. Even the purported corridors are MOAs.] AM-6

I am also very concerned over the process by which the proposal is being considered. Public disclosure has been minimal at best, and the timeline in which interested parties have to comment is unfairly short.

Sincerely,

Wagner Law Firm, PC
By Michael L Wagner
[redacted]

170

Dear Sirs,

I am a Pilot, Single Engine Land, VFR. I live in Colstrip, MT. and I own 1900 acres of Ranch Land in Carter Co. Montana. The land I own is under the Powder River MOA that was put in force in the early 1980's. I have been a Pilot and have owned a Cessna 170-B since 1979. I use my aircraft to count cattle, check on water, Predators, Fences Bulls, and Treaspasing Hunters. All of my flying is at low level, at Reduced speeds (75 to 90 MPH). I have Rolled out of a turn at 250 ft. AGL to see the flame in the tail pipes of a B1B Lancer at less than 1/4 mile away from me. His wings were swept back. I don't know by how many feet he missed me, but it couldn't have been many. He was at my altitude and was going straight away from me.

To Whom It May Concern:

We are writing in opposition to the proposed Powder River Training Complex. There are many concerns to the ranching industry that include safety concerns for the ranchers that have small aircraft of their own to manage and maintain their cattle herds. Interference with Emergency Medical flights, this is a very rural area and there is a real need for the availability of air transportation for medical emergencies; not to mention the disruption of the predator control flights, monitoring of the pipeline systems already in place and small airfields, cattle.

SA-1
SA-7
LU-3
SA-19
SO-5
SO-15
SA-21

We are very opposed to this plan, we feel there has been little thought put into the effects that rural America will suffer.

March 26, 2014

To whom it may concern,

I am writing this to comment on the proposed expansion of the Powder River Complex MOA. When the Draft Environmental Impact Statement on the proposed expansion was released in 2010 for comment, I was in favor of the expansion. I felt our serviceman and women needed it to be able to stay proficient in their duty to defend this country.

Since then, I have changed my mind and no longer favor the expansion of the MOA. This is partially due to my fear that the Air Force would not communicate adequately with those of us who are pilots of small planes in the area affected by the expanded MOA. My fear is based on past examples of government agencies that have failed to communicate with individuals as promised. **AM-3** **SA-19**

I feel a better way to train our military personnel would be to send them to a training area based in Nevada. Population density is much less there. In addition, if they were sent to Nevada for an extended period of time for training, they could be housed there for the training period instead of commuting between Ellsworth and Nevada in their aircraft as has been done in the past. This would mitigate the need for expanding the Powder River Complex MOA and would save taxpayer dollars because housing in Nevada during training would be far more economical than flying back and forth in their training aircraft. **PN-2**

For these reasons I feel the Powder River Complex MOA should not be expanded. **GE-2**

Respectfully Submitted,

James H. Bowers

James H. Bowers

March 21, 2014

Manager, Operations Support Group, ATO Central Services Center, AVJ-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration2601 Meacham Blvd
Fort Worth, TX 76137

I am writing in **opposition** of the proposed enormous expansion of the Powder River MOA.

I own and operate a FAA part 135 charter operation based out of Helena, Montana. We routinely transport passengers and patients throughout Montana and nation wide on a daily basis so are intimately familiar with aircraft operations in and around MOA's.

I can tell you first hand that access into an active MOA while on an instrument flight plan is virtually impossible. The FAA my not have a policy against this but ATC will not clear you through this airspace while "active". This requires a reroute around the vast airspace costing valuable time and at great expense. Additionally, in my opinion, VFR flight in an active MOA with supersonic aircraft is extremely risky and unsafe so that is not a viable option. AM-6

This expansion could essentially block off a huge portion of eastern Montana up to 240 days per year. This would affect not only air traffic in and out of the MOA, the airports under the MOA and over flight traffic as well.

I also find it concerning that this proposed expansion has not been more widely publicized. This expansion will affect far more commercial operators, businesses and pilots than just those under the airspace in the proposed expansion.

This expansion provides no positive economic benefit to Montana and will have a huge negative financial impact by limiting commerce and accessibility to these communities. SO-5

Montana is already home to two existing MOA's.

Please **do not** allow the proposed expansion of the Powder River MOA. GE-2

Sincerely

Dan Norhton
Owner

Manager, Operations Support Group, ATO Central Service Center AJV-C2
Airspace Study 14-AGL-06NR
2601 Meacham Blvd
Fort Worth, TX 76137

To whom it may concern,

The Air Force is again pushing for the Powder River Military Operations Area expansion. Senator Thune from South Dakota is trying to fast track the process with a limited public comment period and no apparent public comment meetings. The past several times the Air Force has applied for this expansion, the public comment period was extended and public meetings were held to discuss the possible impact. I am trying to get the word out about this proposed expansion. If the airspace is approved as requested, it will be the largest terrestrial training space over the continental U.S. The MOA will expand to four times its current size (to 28,000 square miles!) I just want to make sure people are aware of this potentially harmful expansion.

I am Chief Pilot of Executive Air Taxi Corp, a Part 135 charter company based in Bismarck, ND and this airspace expansion could have a very harmful effect on our company and business. The MOA will be active up to 240 days a year, Monday - Friday in the morning and evening. Many of the routes we fly at my company go through the potential airspace expansion and if it is approved as requested, we will have to fly around the airspace when it is active, potentially adding hundreds of miles to our flights costing more fuel and time and raising the cost for our customers. All of the charter flights we do at our company are IFR flights, so we will be forced to fly around this large airspace when it is active. The altitudes on most of the blocks of airspace are 12,000 to 18,000 feet which directly impacts our smaller piston and turboprop aircraft (as they typically cruise in that range) and also our larger turboprop and jet aircraft as they will need to climb and descend through the airspace to get to several of our destination airports in North Dakota, South Dakota, Wyoming and Montana. The blocks of airspace that go down to 500 feet AGL may make it impossible to land and take off at certain airports within the MOA. Even the proposed "Gap MOAs" appear to be intended for military aircraft to get between active parts of the MOA. The size and scope of this proposed expansion is unlike anything currently over the United States and I am worried about the tremendous financial impact this will have not only on our company, but also our industry as a whole. I am very concerned about this proposed expansion and how quickly things are moving this time on trying to get approval. Thank you for your time.

Mr. Kent M. Wheeler, Manager, Operations Support Group
ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth, TX 76137

Dear Mr. Wheeler:

The FAA Helena Airports District Office offers the following comments and concerns regarding ***Airspace Study 14-AGL-06NR for the Powder River Training Complex (PRTC)***.

- As a result of the proposed PRTC expansion:
  - Civilian aircraft that normally fly through southeastern Montana may have to circumnavigate the PRTC causing increases in cost and time. **SO-7** **SO-8**
  - Fixed Based Operator revenues for fuel, tie-down fees, etc., may be decreased due to aircraft avoiding the area. **SO-6** **SO-10**
  - Restriction of civilian use in the PRTC may increase flight training costs, or may reduce the number of students requesting flight instruction due to the hazardous conditions. **SO-26**
  - Further limitations may be placed on already poor radio and radar coverage in the area. **AM-3**
  - Flexibility for ingress and egress to airports will be lost and IFR capability severely impacted. **AM-13**
  - Delays in air ambulance/medical flight service or conflicts and delays in aerial firefighting support may be created. **SA-19**
  - Crop dusting/aerial applications may be impacted. **SO-2**
  - Aviation activity supporting energy development in the area may be seriously impacted. **SO-5**

177

- Use of *"see and avoid"* is difficult for civilian aircraft when military aircraft in the area are operating at speeds of 500+ knots or more. This creates hazardous conditions for those civilian aircraft flying in the area, and may seriously impact the ability of our airports to serve the flying public.

SA-7

Over the past 20 years the FAA has issued Airport Improvement Program (AIP) grants totaling nearly $30 million to five airports in Montana lying within the proposed PRTC expansion: Baker (BHK), Broadus (00F), Colstrip (M46), Ekalaka (97M), and Hardin (new airport expected to be opened in June 2014). In addition, major AIP investment has been made at Billings (BIL), Forsyth (1S3), and Miles City (MLS), located just outside of the PRTC.

SO-10

An AIP grant was issued to the State of Montana to study the economic impacts of Airports in Montana. This report, published in April 2009 estimated that the total economic value of aviation in the region exceeded $280 million. The report showed that, including Billings, over 3,000 jobs are directly and indirectly related to the aviation industry in the area. The PRTC expansion could result in significant economic impacts to airports, flight schools, pilots, and small businesses in southeast Montana. The social and economic impacts to each community and airport need to be studied and mitigated. The airspace study does not identify specific mitigation measures proposed by the Air Force to address the issues and concerns listed above. Without this information, it is difficult to evaluate the impact of the proposal.

SO-10
SO-26
LU-2
SO-26

Over the past several months we have listened to the concerns of airport owners and pilots about the proposal. We recommend that the Air Force work closely with the airports and communities noted above to address and mitigate the impacts to the airports, communities, and aviation related businesses before FAA makes a final determination.

Sincerely,

David S. Stelling

Fort Worth, TX 76137

Manager, Operations Support Group, ATO Central Service Center, AJV-C2,

The USAF is not being fully truthful about the Powder River MOA expansion. During the EIS scoping meetings in 2010, the USAF said that it would have no impact on General Aviation. We could just share the airspace. The USAF said that it would not impact IFR traffic. (all jet traffic and inclement weather operations are conducted under these civil rules) IFR traffic is prohibited in an active MOA by federal regulation!. The USAF also has "Lights Out" night operations approved for the current Powder River MOA. I do not know how VFR civil aircraft will "see & avoid" unlit military aircraft at night. The USAF also said it need this expansion to train in mountainous terrain to simulate Afghanistan operations. There are no mountains in this area! The mountains in Afghanistan have peaks over 24,000 feet high! This expansion is unjustified, causes economic hardship on the local communities and businesses and should not happen.

GE-5

SA-11

PN-02

Sincerely,

Leland Blatter

179

I am writing on behalf of the North Central Hangar of the Montana Pilots Association. Many of our membership are categorically opposed to the expansion of the Powder River MOA. Some of our membership would not be opposed to the vast expansion of this MOA if it was merely big, yet managed the same way that other MOA's are, for example the Hays MOA just south of our home town. However all of our membership has expressed concern that the entire corner of our state may at any time become a "no fly zone". I propose hypothetically, if just a few square miles of Washington DC were randomly closed to automobile traffic a few times a year there would be an outcry of epic proportion. **AM-6**

Pilots will be among the first to support a combat ready, well trained air force. A number of general aviation pilots are retired military. Did they serve a country that is so willing to make a proposal that constricts such a huge part of our airspace?

I find it interesting that this huge expansion does not overshadow Rapid City and not even Ellsworth Air force Base. When I looked at the sectional charts vs. the proposed expansion footprint the phrase "not in my back yard" comes to mind. Perhaps if all military aircraft were prevented from traversing general airspace at random times several time a year, our point may become more clear. **SO-26**

I also studied the WAC charts for other parts of the United States, I see a lot of Military airspace, not only over this country but extending well out over the oceans in some places. I find it hard to believe that the vast number of square miles already designated for military training is inadequate. **PN-2** **PN-3**

I realize my words are not quoting facts, sighting economic studies, or addressing the possible need for bomber training. In my life time I have witnessed the slow and steady deterioration of my freedoms and rights. I have watched our government take from us under the banners of "national security", "patriot act", and "military readiness". I feel it is time to draw the line, every square mile of airspace lost from GA is gone forever. So I close with "**We The People"** are opposed to Powder River MOA expansion! **GE-2**

Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth, TX 76137

I am a pilot and aircraft owner living in eastern Montana. We have family, friends and business ties in south western North and South Dakota. This proposal has a direct, negative effect on our route of flight to those areas. To fly around this massive proposed MOA creates unacceptable expenditures of our time and additional costs to fly around or wait for a period when the area is not active. SO-7 SO-8

Why can't our comments and concerns about the Powder River MOA be submitted via e-mail as we can dealing with other issues that come up for public comment?

Why is the Powder River MOA expansion largely in Montana airspace when it provides no benefits to this state? Who wants it here? The airbases in North and South Dakota will be the primary users of the MOA, build it in their area. I feel this is an effort by Senator Thune of South Dakota to save Rapid City's Ellsworth AFB, that was scheduled for closure in 2005 by the DOD. This expansion was supposed to save Ellsworth AFB/USAF $8 million in the 2010 EIS. That figure appears to have been artificially inflated by a factor of three to $21 million this year. SO-24

Citing data from 2007-2008 Montana Economic Impact of Airports Study that this MASSIVE expansion will jeopardize 95 jobs that generate over $1.5 million in payroll, $3.8 million in economic activity, in the communities that underlay this proposal! This will have a huge negative impact on 39 airports and 285 aircraft effected by this expansion. SO-5 SO-10

It will be the largest MOA in the WORLD, larger than South Carolina, and over 4 1/2 times the size of the Nation of Israel.

When this airspace is used for RED FLAG operations 10 days a year, pilots from all over the world will be flying in this area, FULL SCALE WAR GAMES! It is ridiculous to have this type of operation over populated areas. I object to lack of respect being shown to Montana residents. GE-3 GE-6

Ellsworth does not have an great safety record. There have been two B1's crash in the current PR MOA, Sept '97 & Aug 13, one with 4 fatalities.

The B1-B is extremely expensive to operate as it requires about $1 million in maintenance for every 12 hours of flight time. The USAF wants Minot AFB to bring their aircraft to join in the use of this area. It is approximately 5 times the length of flight to the PR MOA as it is for them to use Tiger & Hays MOA that already exist. There are only 65 B1's left and they have not seen combat duty since 2011. The B52's are a Vietnam era aircraft with only 85 still active. They have not seen combat duty since 2001.

180

I fully support our military and Ellsworth, but get this expansion out of Montana! The USAF is not being honest about his expansion. During the EIS scoping meetings in 2010, the USAF said that it would have NO IMPACT on General Aviation. We could just share the airspace. The USAF also said that it would not impact IFR traffic. (all jet traffic and inclement weather operations are conducted under these civil rules) IFR traffic is prohibited in an active MOA by FAR's (Federal Aviation Regulations). The USAF has "Lights Out" night operations approved for the current PR MOA. How can VFR civil aircraft "see & avoid" unlit military aircraft at night. The USAF said it needs this expansion to train in mountainous terrain to simulate Afghanistan operations . There are no mountains in this area! The mountains in Afghanistan have peaks over 24,000 feet high! Malmstrom AFB in Montana has had it's mission changed several times in the last 20 years. Perhaps the mission for the bases in North and South Dakota need to be redefined, combined or moved to another location.

SO-24
GE-5
AM-6
SA-11

There are numerous pipelines that underlay this proposal. How are they going to comply with DOT inspection regulations? Considerable income is generated by pilots who earn their living to patrol pipelines and power lines in Montana! Recently, August 2013, a B1-B from Ellsworth crashed. I have a friend, a commercial pilot, who was unable to fly one of his routes for over a month as the USAF commandeered the airspace for a 15 mile radius around the crash site by issuing a TFR, a no fly zone! That cost him time & money, neither of which he will ever be compensated for!

SA-21
SO-7

In Baker, Montana, the FAA has spent in excess of $15 million on the airport and it will not survive this expansion. Many things have changed in this area due to the energy boom since 2010. In Baker alone, there is a new multi-million dollar fire station, a brand new motel. Montana Highway 323 is now completely paved & has significant use, linking it to the commerce areas of the Black Hills of South Dakota. Oil production is at all time highs. The main mode of transportation for oil executives, engineers, & personnel to this area is through Baker, MT is by private aircraft. Do we really want restrictions placed on their travel to this remote area?

SO-6

Lives are regularly saved by timely transportation of injured or critically ill patients by helicopter and Life Flight aircraft in this medically underserved area of Montana.

SO-5

All the letter groups, including AOPA (approx. 400,000 members), are fighting together against this expansion. AOPA has labeled it "UNJUSTIFIED" It will become an very hot topic at election time if it moves forward.

GE-3

I urge that this proposal not be approved. Not only is general aviation struggling to survive under increasing control from the government, but the hard working people who live in this area will be negatively impacted by the changes this would bring if passed. South Dakota does not want it expanded in their backyard.... neither does Montana!

Sincerely

Robert D. Lipscomb

To Whom it may concern:

I have some safety concerns regarding the "Powder River Proposal. The main concern for me as a volunteer Civil Air Patrol pilot would be if we were tasked to perform a search and rescue at 1000 to 1500 feet agl in an area where there would be potential for military aircraft to be flying at high speeds. Our communication system and radar coverage at the lower altitudes is not adequate for safe operation and would have to be a high priority and be in place before any such proposal could even be a thought. There would have to a website or automated phone system with updated, current information regarding any activity in the MOA, not just for pilots, but the general public. I am not going to very active in volunteering if the search would happen to be in the proposed area of the MOA. **SA-1 SA-7 SA-19 AM-1 AM-3**

I can only imagine what it will do to and how it will affect the aerial applicators in North Dakota. Some of those individuals don't even have radios or a way to communicate. I do believe there are a number of items that could and would have to be in place before such a large area of proposal would be considered. There are also a lot of other places that this large of an MOA would fit on the map better than the proposed area. Thank you for taking time to read my comments. **SA-7**

To Manager, Operations Support Group,

ATO Central Service Center, AJV-C2, Airspace Study 14-AGL-06NR, Department of Transportation,

Federal Aviation Administration, 2601 Meacham Blvd. Fort Worth, Texas 76137

19 April, 2014

My name is Bailey Egan and I would like to have the FAA deny the proposed expansion of the Powder River Training Complex. I live 20 miles south of Colstrip Montana and will be affected personally from the environmental, economical, and safety issues from this expansion. I have been flying since 1964 and base my Cessna 182 and Piper Super Cub at Colstrip (M46). I'm a seated board member of the Montana Community Airport Association that has 108 members here in Montana. I use my aircraft in my ranching operation along with enjoying flying as one of my hobbies. **GE-3**

I have participated in all the previous hearing concerning this proposed expansion of airspace. It has been obvious throughout the process that the concerns offered by the effected people were not going to effect the decision but actually used to develop a stronger case to make the expansion seem more needed. **GE-5**

The Air Force has never provided a substantial case that this expansion is needed other than to satisfy the desires of a political group that wants to further their position in keeping the economic dollars in their area at the expense of others around them. **PN-3**

I'm affected also as a rancher and if this expansion is allowed it will devalue this family ranch that we have owned and operated for the past 127 years. Much of that value comes from the peace and tranquility that these wide open spaces offer to those that treasure them so much. If we are invaded by low flying, noisy high speed aircraft much of that value will quickly disappear. **SO-1** **SO-4**

The environment is also a concern with the proposal of dropping burning material from their aircraft. The Air Force made great effort to convince land owners of the safety of that practice. It was of little use to even talk of such a thought to land owners that make their living from the grass that grows on the lands of Eastern Montana. My ranch lost 16,000 acres of grazing range in about 6 ½ hours to one wild fire in 2012, 3,000,000 board feet of saleable timber and 85 miles of fence burned to the ground. Corrals, stock tanks and stock wells are but just a few of the items consumed. We will never ever recoup the loss of some of those valued items in my life time. **SA-5** **SA-6**

The inconvenience to me as an aviator will be tremendous, avoiding active military operations, with lost time, delayed departures and burning $6.00 aviation fuel to avoid those situations that are especially dangerous. When you mix slow and high speed aircraft and then add the increased danger of putting them at the same and low altitude is almost unbelievable. **SA-1** **SO-7** **SO-8**

I realize that there are a good portion of the people that work at the FAA that have never been at the controls of either the fast or slow aircraft that will be the major users of this proposed airspace expansion. I have enclosed three documents taken from the FAA website. They list the Mission, Vision and Values of the FAA and the importance that you stress as the main driver in the actions of the FAA. I

184

also am enclosing two other sheets taken from your website that demonstrate the closure rate and the geometry of a collision course that demonstrate very clearly the mixing of a Piper Cub and a F-15. These will serve as a good refresher for those that will be making the decision to allow these types of aircraft to mix in the same environment without radar or FAA services of controlled airspace that is your responsibility. Not even radio coverage in some of this huge expansion of controlled airspace and we were assured by the Air Force that it was "See and Avoid Only" and the burden is on the civilian aircraft because they said they cannot see us quick enough even if they are looking with an observer, which they say they are! **AM-3**

I think you will agree with me that this expansion request is not justified, especially with extending the boundaries where you do not have the necessary control to provide a safe environment for all that fly there. I'm confident that all that work at the FAA share my concerns about the safety issues mentioned here and that they are very legit mate. I hope that their common sense will prevail and that they will deny this unsafe expansion of airspace. With your position on safety in mind it would be unthinkable that you would give the go ahead to a project of this magnitude especially when the need has not been justified. During the past hearings I resented the implication that I was unpatriotic if I should stand in the way of this airspace expansion. A good example is the avoidance of the Reservations, the problem does not go away just at the borders of the Reservations or National Monuments or other singled out areas.

I'm asking you to do the right thing, sort out the politics and listen to the people of Montana. We also do not want all the negative impact, aviation is too important in a State of this size and the effect will be devastating. Stick with your mission statement. An accident has a high probability in this situation and allowing this much airspace to be activated will take most of the Eastern ½ of Montana. The high possibility of an accident is sure to happen and it will fall directly on your hands. The results will be devastating. Consideration of my comments here will be appreciated. Thank You!

Best Regards,

Bailey J. Egan

Mission

Our Mission

Our continuing mission is to provide the safest, most efficient aerospace system in the world.

Our Vision

We strive to reach the next level of safety, efficiency, environmental responsibility and global leadership. We are accountable to the American public and our stakeholders.

Our Values

- Safety is our passion. We work so all air and space travelers arrive safely at their destinations.
- Excellence is our promise. We seek results that embody professionalism, transparency and accountability.
- Integrity is our touchstone. We perform our duties honestly, with moral soundness, and with the highest level of ethics.
- People are our strength. Our success depends on the respect, diversity, collaboration, and commitment of our workforce.
- Innovation is our signature. We foster creativity and vision to provide solutions beyond today's boundaries.

I am writing in regards to the "Powder River Training complex" NO Have you even considered what it will do to our operations? Several years ago these bombers were flying over our places – the cattle were spooked tearing up fences and corrals. We had to keep cleaning up the piles of silver chaff. Are they going to be responsible for the fires started by their flares – highly unlikely. Are local pilots going to be able to do their daily activities or do they have to wait for permission to check their cattle and water – will they even be given permission?

We "DO NOT" want this training activity in Southeastern montana – we are trying to make a living and this type of activity certainly will not help. "NO"

To Whom it may concern:
We are ranchers in the NW corner of South Dakota and are in the target path of the newly proposed expansion of the Powder River Training Complex. In addition to the concerns listed below, we own a small single engine plane that Wayne flies regularly to check on livestock and water tanks on the ranch. Please reconsider this proposal.

SA-1
SO-8
BI-4
SA-5
SA-6
SA-8
SA-18
SA-19
SO-10
SA-21

- ***Threat to safety of ranch pilots monitoring land and livestock from the air.*** This proposed flight path for the large Air Force flights could have severe consequences for the small aircraft that ranchers are using.
- ***Predator Control flights operate will be limited in their ability to continue providing safe, timely service to the landowners who depend on them.Livestock on the ground can be disturbed by sonic bombs and large Air Force flights at low levels.***
- The proposed flight path for these planes has the potential to create dangerous situations for livestock and people on the ground.
- Chaff and flares can, on occasion, fall to the ground and cause grassfires to start. Without a mitigation plan or acknowledgement of this risk, landowners and local fire crews will be left to deal with damages and respond to emergencies
- Interference with Emergency Medical flights in rural areas can be crucial. While US Air Force has committed to making emergency flights a priority, moving large bombing exercises out of that airspace is not quickly done.
- Limiting private and corporate flights into small airports could have a real impact on the ability of those small airports to continue operating and also limit flights into rural communities that could be imperative to business development in those areas. Several small airports in the proposed flight area have recently made improvements to increase traffic to their cities. The low flight floor of the Air Forces proposal could limit or prohibit private air traffic to the 39 airports that will be impacted..
- Air surveillance is being used in many areas to monitor safety and activity in oil field areas and along the propose Keystone XL pipeline. Monitoring is crucial for the regulation and safe operation of the oil and gas industry in our region.

Sincerely,
Wayne and Susan Nelson

April 28, 2014

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth, TX 76137

Dear Sirs:

I am the Chief Pilot for True companies in Casper, WY. True companies objects to the four fold expansion of the Powder River MOA for the proposed Powder River Training Complex. The True Companies have oil drilling, production, trucking, and pipeline interests in western North Dakota and eastern Montana. The True companies have three all-weather airplanes capable of carrying four, eight, or nine employees. We transport our employees on day trips on one of our airplanes more efficiently than we can on the airlines or on the highway. This is a necessary part of our business.

Last year we flew 75 round trips through the affected area from Casper or Gillette to Glendive and Sidney, Montana, Williston, Watford City, Stanley, Minot, and Bismarck, North Dakota. If the PRTC is approved, the difference in the mileages and resulting costs will increase 15-97% depending on the trip averaging 48% total increase in cost. SO-5 SO-7

True companies are one of several energy related entities which rely on general aviation aircraft to economically operate in North Dakota and Montana. Other companies use private aviation from as far away as Texas and Oklahoma. There are weekly crew hauls from Texas and other points south that will be impacted. I doubt these southern based companies are aware of this airspace problem because the so called "Special Use Airspace" circular was not circulated (we didn't get one either).

The impacts on True companies are:

- It is not safe to operate VFR in an MOA occupied by fighter type aircraft. It is very difficult for the respective pilots to see and avoid each other with closure rates in excess of 700 mph. Military pilots are busy performing their mission and may not be looking closely for civilian traffic. Radar is not available in most of the affected area. SA-7
- It is not economical to operate turbine aircraft below 18,000 ft.
- Inability to safely perform pipeline patrol and maintenance on our pipeline in proposed PR- 2, PR-3, and Gap B. I don't particularly want to be chaffed, or flared, or run over while I'm working in our helicopter. SA-21
- Higher operational cost; 15 to 97% per trip averaging 48% annually.
- Payload will need to be reduced by one or more passengers to allow for the extra fuel required to circumnavigate the Powder River Training Complex. We will have to plan for complete closure of the PRTC airspace on every flight because of the historically poor, untimely NOTAM (status information) dissemination, if any. The two hour NOTAM posting promised by the USAF (Executive Summary page ES-13) has historically been inaccurate.

189

- PRTC's proposed active times are during our normal working day commuting times.
- The clause in the proposed active times "...and other times by NOTAM..." implies extra restrictions to IFR traffic. The lack of reliability of this information underscores the requirement to reduce payload to increase fuel load on every flight though the affected area.
- Up to 2 hours lost productivity time for up to nine employees per day increasing man hour cost;
- Cannot get into or out of Baker, Montana when the weather is IFR or diverting to a nearby airport due to weather because it's in PR-3. I am skeptical that the Air Force would recall a flight for an IFR departure or arrival as stated in the Executive Summary page ES-13.
- Many times the company operations in the field are time sensitive and very expensive. A 2 to 4 hour delay, ground hold, or diversion would not be acceptable.
- I don't expect the Air Force will "publish a notice at least one month in advance of LFE'S to help civil aircraft pilots and the public plan for LFE activation." (Exec. Summary page ES-13) We weren't notified about this action; we heard it through the grapevine. GE-5
- Once approved, PRTC altitudes and hours of operation may be expanded further inhibiting our operations.

Conclusion:

The Large Force Exercises apparently include aircraft from other parts of the country. I don't see a lot of difference in the expense of moving northern airplanes to the south where large MOA's already exist, or moving southern airplanes to the north. Other large MOA's currently exist elsewhere in the country

It came out at the meeting in Gillette in 2010 that this airspace grab is largely to create more "need" for Ellsworth AFB and to save it from closing. According to the car dealer and the Chamber of Commerce from Rapid City in attendance, they were concerned about the local economy. I believe that if this airspace is really necessary, then it would be more appropriate to be in South Dakota, closer to Ellsworth AFB. Rapid City can be assured their economy and tax base is safe, and not impact the general aviation access to the economy in Montana, Wyoming, and North Dakota. SO-24

Just today I had a telephone conversation regarding this matter with Dr. John Witucki of the FAA Central Service Center, Operations Support. Now it appears the height of the MOA is to be expanded above what has previously been announced. This whole proposal and the process used to notify the public has been flawed. Proper public comment cannot be made when proper notice is not given.

Would you please add my name and address to your mailing list for future notices? Thank you very much.

Sincerely,

John Campbell, Chief Pilot

Department of Transportation

Federal Aviation Administration

2601 Meacham Blvd

Fort Worth, TX 76137

RE: Powder River MOA – 14-AGL-06NR

To Whom it May Concern:

Air Dakota Flite, Inc. in Hettinger, ND (HEI) has been in business for over 40 years. We are a FBO, with crop spraying as the mainstay of our business. For several different reasons, we would consider a MOA in our area to be a hardship to our business.

Our first area of concern is with crop spraying. Currently, our trade area for spraying is a radius of 80-100 miles from Hettinger, more north, east, then west, least to the south. We maintain 500' AGL when flying to and from fields, then lower for actual spraying. When our sprayers are loaded, they are near gross weight. Right now our concerns are wind and visibility. With a proposed MOA, our concerns are significantly increased. In the 1980's, there was a bomber route through our area using B52s and some fighter jets. B52s were relatively easy to spot, but even then, there were times, that our spray pilots had to change course in order to feel safe. It is also our concern that B1s and B2s will be more difficult to see by our pilots. Unseen aircraft, a loaded spray plane and the wake turbulence could add up to a major problem.

SO-2
SO-28

With our general aviation we have a couple concerns. The first involves our local pilots. Many of them are "Sunday fliers" or pilots who are generally out enjoying the country only during nice weather conditions. So, a MOA would seriously curtail their activity. A local businessman flies routinely, and it would be difficult to schedule his flying with a MOA. In Hettinger, we have a fairly active medical center. We have an average of 1-2 flights per week, bringing doctors to our clinic. These flights mainly use instrument approach and come even in adverse weather conditions. Most of this charter traffic comes from Bismarck, ND, but we do have one doctor that routinely flies in from Rapid City, SD. During the past 6 months, we have also seen an increase in air ambulance flights with an average of 2 per month. We feel that a MOA could affect our general aviation and the interest that is now enjoyed.

SA-1
AM-12
SA-18
SO-5

Serving The West River Area

191

Likewise, any transient flights to our airport will be seriously curtailed with a MOA. Pilots flying through our area are more likely to check the maps and decide to stay clear of our area. Our business will be reduced from lack of pilots using our facilities, fuel sales, etc. Our community also will lose business. AM-5

Another area of concern involves our current and future pilots. In the past 30+ years, we've had an area north of Hettinger that we use for our flight instruction, a practice area for our students. If this area is listed as a MOA, we feel that it will deter the general public from checking into flight instruction. It would be difficult to concentrate on learning or instructing if you are worried about military traffic in the area. SO-26

As a part of our business, we fly an aerial survey for wildlife. This is done for ND Game & Fish Department and we fly Adams, Bowman and Hettinger counties for antelope and deer count. This is a low level flight and as a pilot, you are watching the ground for animals, not the skies for military aircraft. SA-8

ADFI pilots also have a low level flight for highline patrol. Again, the pilots concern is looking at high lines, not for other low level traffic. A MOA would make our low level flights more dangerous to our pilots. Therefore, this is a great concern for us. SA-7

Another low level flight for us is our oil pipeline patrol. Our pilots fly this patrol at 500' AGL and below and are constantly looking downward for any oil leaks and or obstacles. They follow a marked area (trench line) that twists, turns, up and over hills, rivers, around train tracks that spans about 1200 miles of pipeline in southwest ND. We are dependent on weather for this flying and therefore do not follow any set dates. We fly Monday through Sunday, sun up to sun down. Many times, in past years, as with spraying, our pilots flying this pipeline have had to take actions to avoid military jets. Again, a big concern for us! SA-7

Last, but not least, I am concerned about the possibilities of a wind farm near Hettinger. There has been land leased for the past 4 years north of Hettinger and north of GascoyneP for the expressed purpose of a wind farm. So, the possibility of having renewable energy developed in our area is a distinct probability. The major hold up right now is that more investors are needed before the wind farms can proceed. I feel that having a MOA in our area would basically halt any renewable energy development in this area. CM-4 SO-17

IF the military would be doing low level flights, would there be a designated route? – Unknown. Would there be an 800 number that the aviation community could call 24 hr/day to see if the MOA is active? There are a lot of questions that we still feel need to be addressed. We truly fee that this would be a hardship for our business and to our local flight traffic. At this time, with the information we have, we are opposed to a MOA in our service area.

Sincerely,

Charles Q. Lindquist 4-27-14

Joann Lindquist 4-27-14

RE: Airspace Study 14-AGL-06NR This is a poorly thought out extension.
Comments: I am very concerned about the Powder River MOA Extension into SW North Dakota. As a Sport Pilot ~~and~~ familiar with the area, it will be the first thing giving me issues covering an area that is getting busier and more congested with GA traffic because of the oil fields. Airports are being developed. It is also ND's premier tourist area as the MOA will be over the ND badlands. Home to wild horses, bighorn sheep, prong horn antelope, etc.

Proposed Powder River Training Area Expansion

As a pilot who utilizes the airspace in southwest North Dakota, southeast Montana and northwest South Dakota every week doing wildlife survey and research work, the proposed Powder River airspace expansion is of great concern to myself and 10 vendor natural resource pilots who fly for the Game and Fish Department. We fly time sensitive surveys and radio telemetry missions tracking radio collared animals throughout the year during VFR (visual flight rules) conditions. Some pronghorn telemetry missions have taken me as far south as the Wyoming border. It is important that these flights are done in a timely fashion to manage wildlife and set hunting seasons. If the airspace is restricted to military flights as proposed, it will limit or eliminate the effectiveness of the work we do to manage wildlife in these areas. If sharing this airspace is done, having low level high speed jet traffic mixing with us will be dangerous. SA-8 SA-1

Another area of concern is cross country seaplane operations. Seaplanes fly across this part of the country to get from the eastern states to the northwest and Alaska and back. These aircraft are often VFR, water landing only, therefor diverting around this proposed area would be a huge inconvenience at best. AM-5 SO-10

If this proposal was implemented, the fact that adequate radar service is lacking, major radar and communication infrastructure would be required. Also some reliable means of notification to the public of the airspace activation would be required. AM-3

Airspace Study 14-AGL-06NR

Dept of Transportation

FAA

Ft Worth, TX

Ladies/Gentlemen:

I attended the Montana Aviation Conference in March where I learned of the Powder River MOA study. Since that time I have talked with several pilots who do commercial operations in the area regarding this Study. I noticed first that the MOA study covers a very large area of Montana as well as parts of WY, ND, and SD. It is plain to see that VFR pilots like myself will not have an easy time trying to travel east. More importantly, FBOs and other commercial operators could be shut down because of this and cause significant damage to General Aviation in Montana and adjoining states. It will affect these folks immensely and will ripple down through the entire economy of the area. It will even affect myself as an aviation insurance broker. AM-6 SO-10

More than that, it will cause significant problems within the emerging oil industry in our State, and aviation safety will be compromised throughout the entire area.

Regards,

Ken Brion

RE: Powder River Proposal Comments

Dear Sir,

Airport Association of North Dakota (AAND) is an Association of North Dakota's Airports. AAND has among its members 83 out of 89 North Dakota Airports, including the 8 commercial service and 46 general aviation airports that are federal grant eligible as part of the National Plan of Integrated Airport Systems (NPIAS).

The purpose of this letter is to provide comments to the Powder River Military Operations Area (MOA) Proposal. This proposal will quadruple the size of the existing Powder River MOA in an area affecting Southwestern ND, Southeastern Montana, Northeastern Wyoming, and Northwestern SD. AAND supports the military however, we have concerns about the proposed expansion of the Powder River MOA.

Should the MOA be approved and become "active", it will reduce the maximum operating flight altitude to 500 feet for non-military aircraft, which is also the minimum operating flight altitude over a populated area. We are particularly concerned about safe and unlimited access to airports at Bowman, Elgin, Hettinger and Mott. Because of proposed restrictions, the Bowman airport and other airports in that area of the state will have highly restricted operations. Hettinger and Bowman Airports have expended significant resources developing and improving their airport facilities. They have installed automated weather reporting at their airports to improve dependability of air services by both charter and private operators under Instrument Flight Rules (IFR) to their cities. Bowman is currently building a

AM-5
SO-10

196

new airport funded by Federal, State and local sources. These efforts will be negated whenever the MOA is active. IFR flights from other airports, especially Bismarck and Dickinson to these communities during active MOA times are effectively eliminated during any scenario with limited ceiling and visibility because radar coverage is lost below approximately 6,000 feet. While active emergency ambulance flights will undoubtedly be accommodated, routine travel by medical teams will be negatively impacted. Those teams routinely fly under IFR, an option not available when the MOA is active and radar coverage is lost around 6,000 feet in that area. Medical teams that experience delays and cancellations resulting from the MOA will find that they cannot count on air transportation as an efficient means of travel. As a result, these medical providers may stop their services to those communities altogether, eliminating convenient access to essential medical service to thousands of rural residents of southwestern North Dakota. Other GA users will be similarly impacted.

AM-5

AM-1
AM-3
AM-12

If the proposed operating restrictions are not altered there are numerous safety concerns that should be considered. There is poor radar coverage and scanty communication services existing in the area. General aviation flights flying visual flight rules (VFR) would face major safety concerns sharing airspace with low-level, high-speed bombers operating in close proximity. Business and general aviation would be forced to spend additional time and monies to avoid the MOA. Flight training in this area would be highly depressed. Weather Modification in the area would be eliminated because of their "last minute" need to treat weather for increased rainfall and hail suppression. Aerial applicators transitioning between airports and farm fields would be utilizing the same airspace as the military aircraft, but without the safety of radar or communications since in that area they don't exist.

AM-3

SA-1
SO-7 & 8
SO-26
SO-2

We would like to see the MOA proposal mitigated by raising the maximum operating altitude of the military to at least 8,000 feet so that general, business, and commercial flights can still safely occur. If the altitude is not raised we would suggest FAA consider the following suggestions to the proposal prior to approval of an expanded MOA. This suggestions include:

- An installation of adequate radar/communications and ATC procedures which would allow IFR aircraft to utilize the area when the MOA is active.
- A series of enhancements for "notification of activation of the MOA" to the general public such as announcements over a local Unicom frequency, a public phone number to call for MOA information, along with a website that includes updates on airspace activation and deactivation.
- An efficient Airspace Utilization Plan agreement between the military and Air Traffic Control to ensure activation only during military training operations.
- A "memorandum of understanding" between the US Air Force and weather modification companies during the months of their operation of June through August, allowing for their operations.

AM-3

AM-1

SO-28

196

We ask that FAA consider the concerns and possible mitigations when making a decision that ideally will minimize negative impacts to commercial and private aviation users in southwestern North Dakota.

Thank you for the opportunity to comment.

Sincerely,

Timothy J. Thorsen

Airspace Study 14-AGL-06NR

Department of Transportation

FAA

As private pilots, my son and I are writing to express our concern about the dramatic expansion of the Powder River MOA. The 500 foot AGL floor causes many concerns of safety and air space utilization for crop dusters, air ambulance crews and general aviation. The lack of radar services in the area will make it impossible for regularly scheduled airline services or for other IFR flight operations to function in the area.

SA-7
SO-2
SO-5
AM-6

In your outline statements you talk about this place be operational for as little as 10 days a year. While on the surface it seems like a minimal use of the air space, it does lead to safety concerns because people get in the habit of expecting that it's not operational. Some form of broad and commonly accessed warnings about when it is operational will be necessary to insure casual flight operations don't end with catastrophic effects.

If the project moves forward, at the minimum, raising the floor to 8000 feet would allow for safe air ambulance and agricultural flight operations.

If the project moves forward, there needs to be enhanced radar capabilities in the area so that IFR business and personal flights, commercial and private, can have operation efficiencies that will allow them to succeed and be safe.

The sheer size and geographic scope of the project are nearly overwhelming. Please don't take this much of our air space.

David Kragnes Benjamin Kragnes

Dear Federal Aviation Administration Decision-makers:

I am writing in opposition to the expansion of the Powder River Training Complex.

The Draft EIS describes the impacted area as "primarily rural and uninhabited in character." This disrespects the land where we get our meat and grains. The outdoor needs of rural people and farmers and ranchers are necessary on a daily basis, and should not be disrupted with various dangers 240 days out of the year between 7:30-12:00 am. and 6:00-11:30 pm. with a possible ten flights during three hours per day and two flights during six hours per day, plus additional gap flights.

GE-2
SO-13
SA-9

Please continue using the existing SUA sites in Nevada and Utah, perhaps expanding those sites as needed. Exploiting a food source area is not an appropriate use of the land.

It's also not in the best interest of the public when it is known that "modern air warfare has changed dramatically" and the public knows that drones are replacing traditional air defense.

Please do not expand training in this particular area.

Sincerely,

Sylvia Lambert

April 21, 2014

Please note my opposition to the Powder River proposal as it impacts North Dakota's airspace.

I am a 53 year pilot, ATP, aircraft owner, holder of the FAA's Master Pilot Award, airport manager, ex-USAF pilot, retired airline captain, and past chairman of the North Dakota Aeronautics Commission.

Should the MOA be approved and become active, it will reduce the maximum operating flight altitude to 500 feet for non-military aircraft, which is also the minimum operating flight altitude over a populated area. Because of these restrictions, the Bowman airport and other airports in that area of the state will have highly restricted operations. SO-10

I would like to see the MOA proposal dropped, or at least mitigated by raising the maximum operating altitude of the military to at least 8,000 feet so that general, business, and commercial flights can still safely occur. The proposal as written severely impacts the aviation climate in North Dakota. Business and medical flights may not even be allowed to operate in this area, which would greatly affect the quality of care for medical patients in that part of our state in time of greatest need. SA-7

SA-3
AM-3
SO-7
SO-13

As this information suggests, there are considerable safety concerns that should be considered if the proposed operating restrictions are not altered. Because of the poor radar and communication services that exist in the area, VFR (visual flight rules) general aviation flights would face major safety concerns sharing airspace with low-level, high-speed bombers operating in close proximity. Business and general aviation would be forced to spend additional time and monies to avoid the MOA. Flight training in this area would be highly discouraged. IFR (instrument flight rules) flights into and out of the area would not be allowed. Weather Modification in the area would be eliminated because of their "last minute" need to treat weather for increased rainfall and hail suppression. Aerial applicators transitioning between airports and farm fields would be utilizing the same airspace as the military aircraft, but without the safety blanket of radar or communications since their reliability in that area does not exist. Livestock operations in the area will have noise issues with low level high speed supersonic aircraft operating in their area at Mach 1 speeds.

During my days as an Air Force pilot I spent a certain amount of time flying in MOAs. It might have made sense then. But that was in preparation for the "last" war, and to some extent it may have served me during my combat missions in Viet Nam. But we don't fight like that any more!

Make the adjustment.

Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth, TX 76137

Dear Sir,

The Powder River MOA in Montana is not wanted or needed. This is an extremely large area and there are towns. So it is a populated area. People own land and earn a living. It is also an area that pilots fly for recreation and business. To declare it an MOA and close it off, even for 10 days a year, is just unacceptable. SO-5

Imagine a pilot wanting to fly from point A to point B with this MOA in the way. Flying around an area larger than the state of South Carolina would be time consuming and expensive. Also, any pilots in airports or runways would not be able to operate until the MOA declares it open. Even one day of closure for a pilot wanting to fly is unacceptable. You are unjustly taking away his rights. AM-6 According to my information there are 39 airports and 285 aircraft that would be affected. SO-10

The information that I have states that the USAF said that it would not impact on General Aviation or the IFR traffic. If this is true I ask "What planet are they living on?" Even a jet flying from New York to Seattle would be affected. Small general aviation aircraft most certainly would be affected. Once again this area is larger than the state of South Carolina! AM-21

I learned how to fly in the deserts of California around China Lake and Edwards so I have some experience dealing with MOA's. And I also understand their value for the safety of the US. This is just too much to ask pilots and private citizens.

Please deny the Powder River MOA.

Sincerely yours,

Robert Shropshire

203

Dear Sirs, 4-25-14

Why is the Powder River MOA expansion largely in Montana airspace when it provides no benefits to this state?

Who wants it here?

Sen. John Thune!! To save Rapid City's Ellsworth AFB, that was scheduled for closure in 2005 by the DOD. GE-16

This expansion was supposed to save Ellsworth AFB/USAF $8 million in the 2010 EIS, but now it is magically $21 million this year? PN-3

Citing data from 2007-2008 Montana Economic Impact of Airports Study that this MASSIVE expansion will jeopardize 95 jobs that generate over $1.5 million in payroll, $3.8 million in economic activity, in the communities that underlay this behemoth!! South Dakota wants this MOA, great, put it over there. AM-6 SO-5

39 airports and 285 aircraft will be very negatively impacted by this expansion. IFR aircraft will be denied the airspace to go in to this area. What about when somebody has a heart attack and needs King Air transport to Billings ASAP? The Billings hospitals fly King Airs for this purpose and they fly IFR. SA-18 SA-19

It will be the largest MOA in the world, larger than the state of South Carolina!! It will be 4 1/2 times the size of the Nation of Israel. The reason given for this particular airspace was because it simulated combat in places like Afghanistan. It does not, that's a silly argument. PN-2

The USAF is not being fully truthful about his expansion. During the EIS scoping meetings in 2010, the USAF said that it would have no impact on General Aviation. We could just share the airspace. The USAF said that it would not impact IFR traffic. (all jet traffic and inclimate weather operations are conducted under these civil rules) IFR traffic is prohibited in an active MOA by FAR'!. With little to no radar coverage in the area non radar procedures have to be used. The way Salt Lake Center will do this is simple. IFR traffic will be kept out of the airspace. AM-6 AM-3

The USAF also has "Lights Out" night operations approved for the current PR MOA. I do not know how VFR civil aircraft will "see & avoid" unlit military aircraft at night. SA-11

Also, why can't we submit comments electronically? The USAF is trying to slide this along with minimal resistance/input form the civilians & general aviation. That is embarrassing as you are trying to hide. Grow up.

203

The B1B is extremely expensive to operate as it requires about $1 million in maintenance for every 12 hours of flight time. The USAF wants Minot AFB to bring their aircraft to join in the use of this area. It is approximately 5 times the length of flight to the PR MOA as it is for them to use Tiger & Hays MOA that already exist. There are only 65 B1's left and they have not seen combat duty since 2011. The B52's are a Vietnam era aircraft with only 85 still active. They have not seen combat duty since 2001. PN-2 PN-6

I fully support our military and Ellsworth, but get this expansion out of Montana! PN-2

There are numerous pipelines that underlay this proposal. How are they going to comply with DOT inspection regulations? Pipeline pilots livelihood comes from these operations!! Recently, August 2013, when the last B1B from Ellsworth crashed, these pilots were unable to fly one of the routes for over a month as the USAF commandeered the airspace for a 15 mile radius around the crash site by issuing a TFR, no fly zone! This costs time & money!! AM-6 SO-5 SA-21

The FAA has spent over $15 million on this airport and it will not survive this expansion. Many things have changed in this energy rich area since 2010. In Baker alone, we have a new multi-million dollar fire station, a brand new motel, and Montana Highway 323 is now completely paved & has significant used tying us to the commerce area of the Black Hills of South Dakota. Oil production is at all time highs. The main mode of transportation for oil executives, engineers, & personnel to Baker, MT is by private aircraft. Do we really want restrictions placed on their travel to this remote area? Numerous Medevac aircraft fly from the Bakken oil fields every day with patients to Billings. SO-10 SO-17 SO-5

All the letter groups, including AOPA (approx. 400,000 members), are fighting together against this expansion. AOPA has labeled it "UNJUSTIFIED" It will become a very hot topic at election time if it moves forward.

Thank you for your time,

Scott Newpower

President

Montana Pilots Assoc

To: Manager, Operations Support Group

Airspace Study 14- AGL- 06NR- Powder River Training Areas

From: Concerned Pilots, SW North Dakota

I am a pilot in south western North Dakota, and I am very concerned about the proposed Powder River Training Areas. As you may know, western North Dakota has gone through a great change, with the oil activities, associated with the Bakken, Three Forks, and Williston formations. New high paying jobs are increasing, populations climbing, air traffic in double digit increases, and many airports upgrading and expanding to meet the needs of these energy companies. In fact, our local airport is moving to accommodate this increased need. Now we may be faced with many altitude, navigation, operational restrictions associated with the proposed Powder River expanded areas!!

In my view, we gain nothing (no fuel sales, maintenance income, hangar rent, no income to hotels, restaurants, dealerships, etc.), but we are stuck with the proposed low altitude (500' AGL), navigation, gap, and operational restrictions?? Not to mention flares (fire potential), chaff ¦ surface water, livestock affect), low flying fast aircraft (safety issue) and noise? We feel the areas will deter aviation business (who wants to mess with restrictions), and move our income potential to other airports outside the MOA???

SO-5
SO-6

If South Dakota (Ellsworth AFB) wants a larger area, move it to South Dakota!! If North Dakota (Minot AFB) wants an area, go east to the Tiger and Devils Lake MOAs already in place!! Seems like Ellsworth and Minot get the income

PN-2

204

and we in southwest North Dakota get nothing??

I support our men and women in uniform and support training, but there seems to be no compromise to benefit our airport and community??

A few recommendations, I believe, would greatly reduce the training area impacts-

1- area relocation , or area # 3 a "high area" — PN-2

2- raise the area (3) floor from the 500 foot above ground restriction to 8000 feet. — DO-4

3- if need the 500 feet restriction, use it 1 day/week instead of 5 days/ week. — PN-4

4- A direct telephone or web contact, to military training center, for instant Updates, for pilots flying near the proposed areas. — AM-12

Thank you for your consideration.

To whom it may concern,

I am the Director of Operations for Bismarck Air Medical, LLC, a Part 135 charter Air Ambulance Company based in Bismarck, ND. The expansion of the Powder River Military Operations Area will have a very harmful effect on our business because we regularly fly into Hettinger, ND, Bowman, ND and Baker, MT to pick up patients to transfer to higher care facilities. While you have certain hours that it will be active and not active our patients do not go on that schedule and we must be able to go at any time 24 hours a day and 7 days a week. The altitudes are all the altitudes that we need to go through to take off and land at these airports. This expansion would put considerable hardship on the patients and hospitals that we serve in this area.

RE: Powder River Proposal Comments

Dear Sir:

The purpose of this letter is to provide comments to the Powder River Military Operations Area (MOA) Proposal. Bismarck Airport (KBIS) is a Non-Hub primary commercial service airport serving Bismarck, Mandan and surrounding areas of North Dakota. Bismarck has four airlines that serve approximately 480,000 total passengers per year with direct commercial service to five non-stop destinations. Bismarck Airport has 78 Based Aircraft and two Fixed Based Operations (FBO's) serving all aeronautical users with fuel, maintenance, air taxi, avionics, upholstering, hangaring, and other flight line services. Two major energy companies also have hangars, aircraft and flight departments on our airfield. Bismarck Airport also has among its tenants the North Dakota Army National Guard Army Aviation Support Facility. Bismarck Airport and the City of Bismarck are strong supporters of the military; however, we have concerns about the proposed expansion of the Powder River MOA.

We are particularly concerned about safe and unlimited access to neighboring airports at Bowman, Elgin, Hettinger and Mott. Bowman and Hettinger have community medical facilities that are serviced by fly-in medical specialists under IFR controlled airspace by Part 135 and Part 91 aviation providers. These flights deliver medical specialists, on a scheduled basis, to area clinics from large regional medical facilities in Bismarck. There are approximately 80 medical flights that originate from Bismarck Airport each month. These flights are serviced by Bismarck's FBO's or private owners. The proposed MOA expansion would cause delays and cancelations to those teams of medical personnel who travel to serve those communities. Hettinger and Bowman Airports have expended significant resources developing and improving

SA-19
SO-5

[redacted]

206

their airport facilities. They have installed automated weather reporting at their airports to improve dependability of air services by both charter and private operators under Instrument Flight Rules (IFR) to their cities. These efforts will be negated whenever the MOA is active. IFR flights from Bismarck to these communities during these times are effectively eliminated during any scenario with limited ceiling and visibility because radar coverage is lost below approximately 6,000 feet. Both the communities and the aviation service providers will suffer social and economic hardship due to the proposed expansion of the MOA. AM-6

While the Air Force says that active emergency ambulance flights will be accommodated, routine travel by medical teams will be negatively impacted. Those teams routinely fly under IFR, an option not available when the MOA is active and radar coverage is lost around 6,000 feet in that area. Medical teams that experience delays and cancellations resulting from the MOA will find that they cannot count on air transportation as an efficient means of travel. As a result, these medical providers may stop their services to those communities altogether, eliminating convenient access to essential medical service to thousands of rural residents of southwestern North Dakota. The reduction in flights would also have a negative economic impact on the aviation service providers in Bismarck and the communities served. AM-3 AM-5 SA-19 SO-5

The proposal will quadruple the size of the current MOA airspace already present in that region The proposed MOA expansion will have negative impacts on private and commercial aviation users in Bismarck that should be considered as this proposed expansion of the Powder River MOA is reviewed. PN-3

If the Federal Aviation Administration judges that the Air Force is able to justify the need for an expanded MOA - then Bismarck recommends FAA raise the ceiling of the proposed MOA airspace in Southwestern North Dakota from 500 feet, to a minimum altitude of 8000 feet. This would allow aircraft operations in the area to operate under the proposed MOA without a large amount of mitigation being required. If raising the ceiling to 8000 feet is not approved, we would encourage the FAA to make other adjustments to the airspace and navigation aids to allow commercial and private aviation users reasonable access to airports under the MOA when it is active. DO-4

While Bismarck Airport and the City of Bismarck understand need for Military Operation Areas to train our military, the size of this expansion is unprecedented, increasing the existing MOA by four times its current size. The MOA when active will impede access to medical facilities, negatively impact aviation business, and cause traffic separation concerns in an area of limited AM-6

206

radar and communications coverage. We ask that FAA consider the concerns and possible mitigations when making a decision that ideally will minimize negative impacts to commercial and private aviation users in southwestern North Dakota. AM-3

Thank you for the opportunity to comment.

Sincerely,

Gregory B. Haug
Airport Manager

To whomever it concerns:

Why do you want this dangerous situation to be within our National Airspace System? How does See & Avoid work with military aircraft? They are designed not to be seen right? How do you guarantee separation of IFR aircraft within the MOA? There is no way this is possible within the Powder MOA Expansion Area.

Explain to me and everyone else why this airspace has restrictions when it is not considered a "Restricted Area"? The following definition below is from the FAR/AIM.

3-4-5. Military Operations Areas

a. MOAs consist of airspace of defined vertical and lateral limits established for the purpose of separating certain military training activities from IFR traffic. Whenever a MOA is being used, nonparticipating IFR traffic may be cleared through a MOA if IFR separation can be provided by ATC. Otherwise, ATC will reroute or restrict nonparticipating IFR traffic.

How will the military and ATC guarantee the safety of this 28,000 square mile expansion? Who is providing in radar and communications for this area? There is very poor, if any radar and communications at lower altitude! I've been a pilot for the last 12 years in this area and have grown up in Baker, MT just north of the existing Powder MOA. I have first-hand experience in trying the deal with the current MOA. It is not a safe environment to operate in an aircraft nor have I ever been allowed through an active MOA IFR. This causes undue hardship to the FBO that I work at and help operate. This expansion can simply not be allowed!

SA-1
AM-3

The proposed expansion is not reality for the military. They have existing airspace all over the United States. As pilots, we all learned to fly. By definition of FAR 61, we have to complete cross-county experience. Isn't that what the military wants, training experience? Why don't they use the Special Use Airspace (SUA) that already exists? What is all the other SUA's used for in the current National Airspace System?

PN-2
PN-3

Why does the proposed expansion Powder River go down to 500 AGL and in some cases to the surface? What happens when something goes wrong in these military aircraft? There has been two B-1 crashes within the current Powder MOA. Everybody's seen Top Gun right? Where's the hard deck? What margin

DO-3
SA-20

207

of error is there at 500 AGL or less? Why isn't the floor of this huge expansion at 18,000 so everyone could share the airspace?

The facts of Powder River MOA Expansion simply are not accurate. PR-3 has to be done away with since there is no way to conduct this activity safely. There is no economic benefit to this energy rich area. I look forward to hearing a response to my comments.

RE: Powder River Military Operation Area

To Whom It May Concern:

Enclosed is a resolution signed by the Adams County Commission regarding the proposed expansion to the Powder River Military Operation Area.

Please forward this resolution to the appropriate individual.

Thank you for your prompt attention to this matter.

Sincerely,

Chuck Christman

RESOLUTION OF THE ADAMS COUNTY COMMISSION

April 14, 2014

Whereas, the FAA has put forward a proposed expansion to the Powder River Military Operation Area that would include a substantial portion of the State of North Dakota, including the County of Adams;

Whereas, the proposed expansion would have an effect in Adams County and other surrounding counties that are adverse not only to the operation of air ambulance service, charter and general aviation, in and through Adams County, as well as an adverse effect to livestock and farming operations along with general quality of life; SA-19 SO-5 SO-6 SO-11

Therefore, It is hereby resolved that the Adams County Commission resists and urges the FAA to deny the request for the expansion of Powder River Military Operation Area in to the State of North Dakota and specifically over Adams County, North Dakota. GO-2

Re: Proposed Establishment of the Powder River Training Complex Military Operations Areas, North and South Dakota, Montana, Wyoming, Airspace Study 14-AGL-06NR

Dear Mr. Wheeler,

The Aircraft Owners and Pilots Association (AOPA), the world's largest aviation membership association, submits the following comments in response to the Powder River Airspace Study 14-AGL-06NR. The proposed expansion of the Powder River Training Complex (PRTC) would be the largest Special Use Airspace (SUA) complex in the United States and would cover an area of approximately 28,000 square miles, roughly the size of South Carolina. AOPA is concerned that 39 airports would be faced with airspace access challenges, safety issues and a heavy economic burden. For these reasons, AOPA seeks mitigations to the PRTC proposal to minimize the impact to the flying public, and provides the following concerns and associated impacts of the proposed airspace expansion.

Economic Impacts of the Proposal are Excessive

The United States Air Force (USAF) is required to give public use airports that underlie Military Operations Area (MOA) airspace a three nautical mile radius and 1,500 foot exclusion area. However, this exclusion area does not allow for aircraft to transit the airport safely nor does it provide any accommodation to the 20 private use airports, all of which would be unusable during times of PRTC SUA activation. Without real time SUA data, locally based and transient pilots will lose flexibility in choosing departure and arrival times at airports underlying the PRTC. In the long term, this reduction in flexibility will result in businesses and private owners relocating their aircraft outside of the PRTC to avoid the expense and delay associated with operating through expansive SUA. AM-5

Fixed base operators (FBOs) rely on local and transient aircraft as their primary sources of income. When local operators begin relocating their aircraft to airports outside of the PRTC, income from fuel sales, hangars, and tie down fees will drop precipitously. Based on data contained in the 2007-2008 Montana Economic Impact of Airports Study, the average airport underlying the PRTC provides 5 jobs, $81,000 in annual payroll, and nearly $200,000 in economic activity to the surrounding community. With 19 publicly owned airports underlying the PRTC, this translates to approximately 95 jobs, $1.5 million in annual payroll and $3.8 million in economic activity in the surrounding communities directly attributed to the airport. This economic activity is not sustainable under the PRTC and will be eroded until reaching a point where operating an aviation business under the PRTC is no longer financially viable. Transient aircraft will be more likely to utilize an airport outside of the PRTC even if means renting a car and driving to their desired destination inside the PRTC. This will further erode the FBO's income through lost fuel sales and ramp fees. Operating margins for

300

an FBO are extremely thin and even a small decrease in normal traffic levels will have devastating consequences to these small businesses.

The PRTC will negatively affect the flight training industry at 39 airports underlying the proposed airspace. The USAF has stated that one of the key drivers of the PRTC is to avoid expensive, unproductive commutes to distant ranges. The same can be said for general aviation pilots who are paying for flight training as well. Flight instructors would be forced to choose between conducting a flight in an active MOA with low altitude military aircraft operating at speeds in excess of 500 knots, or commute as much as 50 minutes to conduct the flight training outside of the SUA. A typical general aviation training flight lasts approximately 1.5 hours. Adding an additional hour and forty minutes of flight time to every flight lesson, will more than double the cost of earning a pilot certificate. When faced with additional flight time expenses exceeding $7,000 over the course of their private pilot training, potential student pilots will simply drive to an airport outside of the PRTC, or forego learning to fly altogether. This is too high a price for civil aviation to pay, and mitigations must be considered to be a responsible steward of the national airspace system (NAS). SO-26

Reduce Charted Times of Use to Match Actual Planned Usage

AOPA recommends that the FAA require the USAF to amended charted times of use to more accurately depict the actual usage of the proposed PRTC airspace, in order to minimize the impact to the flying public. The Powder River I-4 MOAs are proposed to be active Monday- Thursday 0730-1200; 1800-2330 and Friday 0730-1200, as well as other times by Notice to Airmen (NOTAM). While this amounts to 44.5 hours per week the USAF has said they may use it as little as five hours per day. With the ability to activate the airspace by NOTAM at any time this could be modified to 24/7 and likely will be during large force exercises. PN-5

The proposed PRTC would consist of four primary MOAs, separated by Gap MOAs, mostly extending from 500 feet above ground level to, but not including Flight Level 180 with charted times of use amounting to about 44.5 hours per week. However, the USAF has stated that they expect to use most of what is proposed for just 15 hours per week. While charting 44.5 hours of use provides enormous flexibility for the USAF, it would increase operating expenses, increase delays, and degrade safety for 285 based civil aircraft and countless Visual Flight Rules (VFR) transient operators who will be required to traverse an active MOA to arrive or depart one of 39 airports underlying the PRTC. Pilots operating under Instrument Flight Rules (IFR) will be routed around the MOA's when they are in use and likely will incur delays as a result of reroutes. In addition, the proposal provides for the use of NOTAM to schedule SUA outside of charted times of use. With a minimal need provided in the justification for the proposed expansion, the extensive charted times as well as the allowance of additional flexibility seems excessive.

With a lack of real-time SUA activation data, general aviation pilots are forced to rely primarily on charted times of use for flight planning. However, this information does not reach most pilots and therefore does not mitigate the impact. AOPA would like to see the USAF amended charted times of use to more accurately depict the actual usage of the proposed PRTC airspace, in order to minimize the impact to the flying public. AM-6

Eliminate GAP MOA's and Make Them Temporary

As outlined in the Federal Aviation Administration (FAA) Order 7400.2K, Procedures for Handling Airspace Matters, 25-1-7 Temporary MOAs (TMOA) are designated to accommodate the military's need for additional airspace to periodically conduct exercises that supplement routine training. There are three Gap MOAs in the current PRTC proposal, which would be corridors between the larger MOAs, only utilized for large force exercises, approximately ten days a year. Eliminating the Gap MOA's, and making them TMOAs could address the military's need for training airspace while substantially reducing the impact on general aviation.

The USAF requests several TMOAs annually for military exercises nationwide, ranging from 10 days to 31 days. This leaves AOPA questioning the need to establish permanent SUA for the Gap MOAs when the Draft AM-34

300

Draft AM-34

request for TMOAs are routine for exercises that are longer in duration than what is being proposed for the PRTC. The full time establishment of SUA is extreme considering the MOA would be inactive 98% of the year. Establishing TMOAs would allow for true transit capability for non-participating aircraft that would be utilizing the PRTC airspace area.

Establish Special Use Airspace Communication Plan

AM-3

The lack of real-time information sharing makes it nearly impossible in the current airspace environment for non-participants to know the actual status of SUA at a given time. Not having the ability to obtain real-time airspace information forces civilian pilots to rely solely on charted times of use. According to a survey by AOPA, 67% of pilots circumnavigated SUA regard less of its activation status due to lack of timely and reliable information. Although the USAF plans to notify air traffic control when airspace is no longer active, there is limited communication coverage in the PRTC making it unlikely that general aviation pilots will be aware that the SUA has been deactivated, or is about to be activated. A Special Use Airspace Information Service (SUAIS) system is a 24- hour a day communication system which provides civilian pilots with real-time infonnation regarding military flight operations. Since 1990, SUAIS has been successfully used in a large SUA complex in Alaska, which has greatly improved situational awareness for both civil and military airspace users.

AOPA believes that the FAA should require the USAF to implement a similar service to the PRTC airspace area. As part of a UAIS system, a commitment would be essential by the USAF to implement radio coverage, allowing communication with range control, a tape recorded message that could be broadcast during hours when range control is unmanned, and radio repeaters to provide adequate coverage so there are no gaps in coverage at any altitude. All infrastructures would need to be installed and operational prior to finalizing the PRTC proposal.

IFR Access to MOA Airspace

AM-6

AOPA requests that no additional MOA airspace be added until provisions are made to provide real-time Instrument Flight Rules (IFR) access through active MOAs. While the access may be restricted to limited flight altitudes, it is essential that civil traffic, both emergency and routine, have access to communities both inside and adjacent to MOA airspace given the critical role aviation plays in Montana, Wyoming, orth and South Dakota's transportation systems. For example, an aircraft needing to fly from point A to point B would normally make a relatively direct flight along certain airways, when the proposed MOAs would be active, aircraft would be re-routed, increasing the distance around the airspace. Due to the huge size of this MOA complex, lacking the ability to cross them using the protections of the IFR system is a significant safety as well as economic impact on the aircraft operators, and the customers that pay for the increased operational cost.

Expansive and frequently used SUA significantly impacts the availability to instrument flight operations. IFR aircraft are rarely routed through active MOA's and thus routed around at the expense of the operator. Increased MOAs that further block IFR airways create a significant burden on the NAS, IFR access is essential to improving access and aviation safety between communities that underlie the PRTC. Expansion of T-Routes and wide area augmentation system (WAAS) approaches are providing this access under a wider range of weather conditions, adding to the benefits of the IFR system. Those benefits are seriously degraded by expansions of MOAs that preclude IFR access for all but emergency or Lifeguard flights.

Reduce Impact of Powder River 3 Low MOA

AM-5

The proposed Powder River 3 (PR3) Low MOA would be from 500 feet above ground level (AGL) to, but not including 12,000 feet mean sea level (MSL). Powder River 3 Low would negatively affect underlying airports, including Baker Municipal Airport (BHK). Baker Municipal Airport provides several services to the local community, linking remote communities to larger cities in the region and accommodates extensive corporate aviation activities related to the area's petroleum industry. Currently, there is limited radar coverage under

300

10,000 feet MSL, in the area that would be PR3 low, leaving a significant risk to non-participating aircraft legally transiting MOA airspace. Establishing radar coverage to the surface would help to alleviate this risk. AM-5

Eliminating the PR3 Low or only activating it by NOTAM would significantly reduce the impacts to BHK and other airports. Doing so would keep dangerous operations segregated from civil traffic and ensure the PR3 low was only used when necessary. Civil and military aircraft are dependent on see and avoid procedures to mitigate the risk of a mid-air-collision. The USAF plans to operate aircraft at speeds up to 540 knots within the PRTC rendering see and avoid extremely difficult and unsafe. Establishing radar coverage to the surface would help mitigate this dangerous combination of high speed, low level military aircraft with civil traffic. AM-6

Additionally, establishing corridors for ingress and egress to BHK would mitigate the impact to a host of services including aircraft fuel, maintenance, rental and aerial pipeline patrol. AM-5

Summary
AOPA understands and respects the military's need to train. However, the massive scale of this airspace will have damaging impacts on the general aviation industry. Based on the economic impacts and safety concerns with the proposed expansion of the PRTC, mitigations are a must to reduce the impact of this expansive airspace design and its substantial effect on civil aviation. These mitigations, combined with previously agreed airspace modifications, would reduce the impact of the proposal on civilian aircraft.

Sincerely,

Melissa McCaffrey

ATTN: Manager, AJV-C2, Airspace Study 14-AGL-06NR

Thank you for the opportunity to provide comment on the proposed Department of Defense (DoD) expansion of the Powder River MOA into the Powder River MOA Training Complex (PRMTC). Per invitation via notice in the FAA Circular Airspace Study 14-AGL-06NR, the USDI-Bureau of Land Management (BLM), Montana/Dakotas State Office would like to present comments for your consideration.

Our agency is responsible for land resource management of a large portion of the federal lands underneath the proposed PRMTC. The BLM attended the Air Force public scoping meetings during the initial proposal and also submitted comments in response to the PRMTC draft EIS. Our comments as submitted to the DoD remain unchanged, please find a copy attached.

In consideration of the comments submitted to the DoD, the BLM is requesting the FAA postpone making a decision on the PRMTC until sufficient time has passed to review the final EIS and respond to the FAA with a comprehensive reply.

If you require additional specific information or need clarification on the attached concerns, you may contact Bob Flesch, BLM State Aviation Manager via telephone at 406-896-2912, via email at bflesch@blm.gov or via U.S. mail at BLM-Fire and Aviation, 1299 Rimtop Drive, Billings, MT 59105. Thank you for your consideration.

Sincerely,

James A. Albano

TAKE PRIDE IN AMERICA

In Reply Refer To:

1600 (MTCOOO)

Ms. Linda DeVine
PRTC EIS Project Manager
HQ ACC/A7PP
[redacted]

Dear Ms. DeVine:

Thank you for the opportunity to provide public comment on the Powder River MOA Training Complex (PRTC) draft Environmental Impact Statement (EIS). The United States Department of the Interior (USDI), Bureau of Land Management (BLM), Eastern Montana/Dakotas District (EMDD), Division of Fire and Aviation within the Eastern Montana Fire Zone (EMFZ) has reviewed the proposal and would like to provide comments. As our agency is a primary user of the current and proposed airspace, we would like to see the following concerns addressed in the final Environmental Impact Statement and in your deliberation toward choosing your preferred alternative to implement:

AM-6

1) PRTC PROPOSED ACTION ALTERNATIVES
During the 2008 public scoping period, our office provided you with a request to consider another alternative as was stated below:

> "BLM would also like DoD to evaluate one additional alternative. Please consider, in addition to the existing MOA, adding only one area identified as area PR-3 MOA in the proposal literature. This MOA location north of the existing MOA would add space for additional DoD training and also have the least impact on the Eastern Montana Fire Zone (EMFZ) as far as the number and frequency of aircraft to schedule/deconflict."

AM-12
AM-26
AM-33
SA-19

In reviewing the PRTC draft EIS, the military determined this alternative would not provide adequate training airspace. In consideration of the proposed alternatives, the Fire and Aviation Division of our BLM office would prefer to support the No-Action Alternative over the proposed Alternatives A, B, and C. This is due to the following considerations: potential increased man hours that would be required to coordinate/deconflict the majority of our emergency response flights, which now occur in areas not designated as MOA airspace; potential increased man hours that would be required to coordinate/schedule almost daily fire detection flights during the summer that would occur in the majority of the proposed PRTC identified MOA's; lack of assurances that DoD aircraft can be contacted immediately in "real time" to ensure they will relocate or curtail low level training operations and safely yield to higher priority emergency response aircraft entering active MOA's.

PN-2

Should the DoD elect to adopt an alternative other than the No-Action Alternative, then the Fire and Aviation Division of our BLM office would prefer the implementation of proposed actions as presented in Alternative B. This is due to the following considerations: our area of highest

302

emergency response aircraft activity occurs over the Ashland Ranger District of the Custer National Forest (adjacent to theNorthern Cheyenne Indian Reservation) where there is currently no MOA established- and the option to not establish PR-1A/B MOA and Gap A MOA would help to ensure that our highest use area remains minimally impacted; savings of taxpayer dollars realized in fuel conservation by utilizing MOA's located closer to established military bases, where it is less likely for our emergency response aircraft to be dispatched to (thus providing for fewer interrupted military training sorties). PN-2

2) PRIORITY TO LIFE FLIGHT & EMERGENCY RESPONSE AIRCRAFT
Our staff attended public hearings for the PRTC draft EIS in Miles City, MT on Friday, October 15, 2010. DoD personnel addressing the attendees at those public hearings confirmed that Life Flight and Emergency Response Aircraft activity held higher priority for MOA airspace use than military training sorties within the existing and proposed MOA's. SO-5 SA-7

The BLM would like to see the Final EIS address exactly how the DoD intends to uphold MOA airspace use prioritization. While the scheduling of known flights involving resource project missions and non-emergency fire reconnaissance is understood, the process of having military training missions/sorties yield to Life Flight and Emergency Response Aircraft is not well addressed. Verbiage within the draft EIS indicates that emergency-related activities would be avoided by military training aircraft and that ATC would notify the training aircraft of the emergency. After being contacted, the affected military training mission would avoid the incident area, move to another actiye airspace or return to base in accordance with agreed-to procedures. The draft EIS does not seem to address the additional impacts to public and civil entities involved with emergency related missions should the existing MOA be expanded into the PRTC.

The BLM would like the final EIS to adequately address the impacts to public and civil entities who provide aircraft with rapid access in response to emergency related missions. The BLM would also like to see the specific procedures and protocols of prioritized MOA airspace use be well documented for correct implementation. The nature of life flight and emergency response aircraft missions are unpredictable as to specific launch times. Any steps taken to ensure military aircraft training at low level (i.e. below 5000 feet AGL) yield to higher prioritized missions (by altering training areas or curtailing operations) will need to be immediate and real time.

3) IMMEDIATE "REAL TIME" COMMUNICATIONS WITH MILITARY AIRCRAFT
When an interagency dispatch center launches public aircraft to respond to a wildfire, these aircraft and pilots meet established standards to ensure operational safety. These interagency fire aircraft are required by policy to maintain radio communications with the dispatching unit at all times. The jurisdictional agencies bare the expense of radio communication systems to ensure that aircraft can be contacted real time in the interest of protecting life and property.

One of the greatest concerns of the Fire and Aviation Division within our BLM office involves the delay in relaying airspace use prioritization to military aircraft currently in training within the MOA. Verbiage within the draft EIS indicates the DoD is aware that there is limited communication capabilities in the region. Specific verbiage within the draft EIS states "radar and radio communications are limited below 12,000 feet MSL and in some areas are limited below FL180". (see page ES-14) However, also within the draft EIS there is verbiage stating that the military "would establish communication procedures to ensure the ability to recall the military aircraft from the low altitude MOA's" (see page 2-110) and that the military "would AM-3

302

tablish communication procedures to ensure deconfliction with emergency flight operations within the proposed airspace" (see page 2-110).

In another section of the draft EIS, there is verbiage which seems to contradict this where it states "there is no proposal for increased radio frequency coverage or radar coverage for the PRTC airspace where current coverage is limited" (see page ES-18). DoD officials have informed us that it may take up to 30 minutes for either them or the controlling ARTCC to contact military aircraft currently involved in low level flight profiles. Our response times enable us to have aircraft within MOA airspace in as little as 15 minutes. Because military aircraft in training are not required to maintain immediate "real time" communications to yield the airspace to higher priorities, there can be an unsafe period of at least 15 minutes, and likely more, of increased potential for mid-air collisions. This period of increased risk and exposure would require mitigation to address the effects to other airspaces uses.

The BLM would like to see the DoD address in the final EIS how they will ensure that military training aircraft will be contacted immediately in "real time" to be informed that they must yield to the more critical life flight and fire suppression aircraft in the interest of promoting mid-air collision avoidance. Incident response dispatch centers would need some form of confirmation that military aircraft have indeed been contacted and acknowledge that they are yielding low altitude flight profiles to higher priority emergency response aircraft occupying the airspace.

AM-3

4) COLUSION AVOIDANCE UNDER V.F.R. CONDITIONS

Due to the nature of each agency mission, "see and avoid" may not be sufficient mitigation for mid-air collisions. BLM would like DoD to address more reasonable and effective avoidance measures other than "see and avoid" VFR procedures to prevent mid-air collisions, and seek to increase the safety of our aviation personnel.

SA-1

5) REASONABLE AVOIDANCE MEASURES

There exists predictable periods of airspace usage based on historical data from which reasonable mid-air collision avoidance measures can be implemented. For example, the BLM rarely responds to wildland fires with aircraft from November through April. The shoulder months of the fire season include May and October where average fire season use of aircraft is low. Usage increases to a moderate level in June and September. Our period of highest aircraft use is July and August, when ground fuels are most receptive to ignition sources such as lightning.

In addition, the majority of our incidents are concentrated within a known geographical area. With the likelihood of aircraft responding almost daily to fire dispatches into what would likely be the PR-1 A/B MOA and Gap A MOA during what is typically a two month period, it would seem appropriate for the DoD and partnering agencies such as the BLM to adopt reasonable avoidance measures in the interest of mid-air collision avoidance. This falls in line with your planned actions to avoid altitudes that would interfere with commercial aircraft. In addition, many of our aircraft have to transition from established bases to the TFR area each mission to reload with fire suppressants/retardants and thus have a period of risk during flight not addressed by implementing the TFR.

Please find attached a 20-year fire occurrence map indicating historical incident locations. The majority of fires on the EMFZ are "short duration" which means that the use of aircraft to aid in the suppression of these fires typically lasts only 1 to 2 days. It is impractical to establish a TFR for multiple fires when most are going to be contained within 2 shifts. It would be more practical if the EMFZ could call the DoD scheduling desk and let them know that we have active fires requiring the use of aircraft and that our aircraft will remain 3500' AGL and below (our

SA-1
PN-2
AM-3
SO-5
SA-7

302

ceiling height for Fire Traffic Area dimensions). If the DoD would initiate avoidance measures such as establishing their training floor (hard deck) with a reasonable buffer (say 5000' AGL) then the establishment of TFR's that could number into the hundreds annually during June through September may be avoided. USAF personnel informed BLM that DoD training is typically done either at low level or well above our Fire Traffic Area ceiling. Ideally it would save multiple agencies tremendous coordination time, effort, and expense if no low level DoD training were held during the primary fire season when the EMFZ utilizes aircraft on active incidents (typically between June through September).

It would seem to be less efficient and more costly when low level military training missions within the proposed PR-1 A/B MOA and Gap A MOA are curtailed or interrupted repeatedly from frequent emergency response aircraft dispatches. When considering the data presented in the draft EIS concerning the Average Annual Baseline Training Hours and Estimated Annual Day-to-Day Time and Altitude Distributions, implementing a 5000' AGL low level VFR training floor as a temporary avoidance measure during the highest fire occurrence period would seem a reasonable and realistic solution.

Verbiage within the draft EIS indicates that the military would establish reasonable temporary or seasonal avoidance areas for concerns with other topics already identified, such as over ranches during calving/weaning/branding seasons or cultural native American/tribal events. Specific verbiage indicates the military "would establish reasonable temporary or seasonal avoidance areas or could adopt other measures identified in Government-to-Government consultation..." (see page 2-100). The BLM would like the PRTC final EIS to address reasonable avoidance measures which would include no low level military training flights during the highest incident response months within all existing and/or proposed PRTC MOA's.

SA-1
PN-2
AM-3
SO-5
SA-7

6) SCHEDUUNG OF LONG DURATION MULTIPLE MOA FLIGHTS

With the current size of the Powder River MOA, it has been practical to work out a schedule with DoD when fire detection aircraft need to patrol the Eastern Montana Fire Zone (EMFZ). Lightning maps from the previous storms determine areas that are to be flown by detection aircraft. Historically the majority of fire activity on the EMFZ is south ofinterstate 94. To date, we have been successful to direct flight routes through the current MOA during periods of DoD inactivity.

However, with the proposed expansion of the PRTC spanning from Billings, MT to Bismarck, ND this would end up encompassing most of the southern half of the EMFZ, which is where our predominant fire activity occurs. At public hearings held in eastern Montana during October of 2010, DoD officials commented in their presentations that expansion of the current MOA into the PRTC would not impact Life Flight or Emergency Response Aircraft missions. Is there analyses within the draft EIS to support this? Incidents within the current MOA utilizing aircraft require man-hours to coordinate and deconflict the airspace each time. With the proposed expansion, that workload will increase proportionately.

How will BLM be able to do late morning/early afternoon VFR reconnaissance flights (typically lasting about 3-4 hours due to the size of the area of jurisdiction) to cover that area in the proposed Powder River 1, 2, and 3, which may need to occur daily from June through September? Would DoD schedulers be able to reserve a 3-4 hour time slot in late morning/early afternoon for Powder Rivers 1-3 that will facilitate a VFR detection flight daily through those 3 MOA's for basically a 4 month period?

SA-1
PN-2
AM-3
SO-5
SA-7

302

7) FUTURING POTENTIAL MOA AIRSPACE USAGE

The PRTC Draft EIS indicates that expansion of the existing MOA into the PRTC will benefit both current and future DoD training needs, yet there is very little discussion found within the document to address potential future airspace use. The BLM would like to see the EIS address how expanding the current MOA could potentially allow additional training opportunities that have to date been prevented, due primarily because of size. PN-2

8) MISCELLANEOUS UNANSWERED QUESTIONS

Most of the following questions were presented during the public scoping period and answers were either not provided or could not be found within the draft EIS:

- What safety measures beyond see-and-avoid will the DoD implement to buffer between military and civil or public aircraft operating concurrently within an active MOA? SA-7
- Will there be quantity limitations as to how many military aircraft will occupy any given PRTC area at any one time? PN-2
- As ARTCC's covering the proposed PRTC are divided between Salt Lake City, Denver, and Minneapolis, will there be a communication gap in contacting military aircraft that are moving between MOA's as ARTCC's hand off DoD aircraft to each other?
- Will the FAA be considering moving ARTCC jurisdictional boundaries to simplify coverage within the PRTC?
- How will the scheduling of non-DoD aircraft occur within the MOA's during the quarterly "mass" large force DoD exercises (LFE's) that are anticipated to last from 1-3 days?
- If the DoD will be monitoring seasonal fire conditions to determine when to discontinue use of chaff and flares over receptive fuels (i.e. NFDRS; Red Flag Warnings; etc.), how and when will the decisions be made to implement and rescind these actions? AM-12 AM-27
- What sort of aircraft chaff/flare training is available to educate interagency wildland fire investigators? SA-5 SA-27
- How quickly will newly used flares and chaff deteriorate so that fire investigators who find them at fire origin locations can determine that the fire could not have started from recently utilized or misfired flares?
- With a larger area to facilitate training of more mission profiles, what are the additional impacts of military ground assets that will likely be integrated into the local training should the MOA expand?
- USAF personnel stated that there is one large fixed and two mobile pedestals used as threat emitters in 15 locations currently within the Powder River MOA. They also stated that these threat emitters require electricity and phone connections, and are therefore moved infrequently. The USAF representatives said that no new threat emitters were anticipated for installation, as current emitters would be adequate for the entire expansion. Should long term needs dictate the need for additional threat emitters, how will the DoD undertake NEPA analysis tiered to the final EIS? PN-2
- Will the military include the use of AWACS aircraft during the Large Force Exercises (LFE's) to enhance the realism of an actual large force mission and concurrently increase the safety of civil, public, and military aircraft within the MOA?

Thank you again for the opportunity to provide input into the final EIS. If you have any general questions, you may contact Kathy Bockness, Planning & Environmental Coordinator for the Miles City BLM Field Office, via phone at 406-233-2844.

302

Aside from the comments above to the Draft PRTC EIS, the Montana/Dakotas BLM State Office currently has a signed Memorandum of Understanding (MOU) between the BLM and Ellsworth Air Force Base in South Dakota where scheduling of the existing MOA occurs. While this document is adequate toward assisting our agencies in achieving mutual objectives of shared airspace usage within the existing MOA, any expansion of the existing Powder River MOA into a larger PRTC would necessitate changes be made to the agreement to address the additional impact.

Personnel who assembled the original MOU agreed that should the MOA be expanded into the PRTC, the document would have to be updated to reflect changes such as the structure of an expanded MOA or inclusion of other affected agencies. Discussions then addressed the likelihood of formulating a MOA committee to address issues/concerns by the identified agency partners as well as development of a more inclusive MOU.

In consideration of the large number of civil and public entities, of which may include city, county, state and federal agencies and other potential partners which could be affected by implementing an expansion to the existing Powder River MOA.....it is requested that a multiple agency "umbrella" Memorandum of Understand (MOU) be developed. We would encourage that development of the MOU be accomplished by open invitation and collaborative teamwork in good faith from interested partners, with periodic meetings of an area MOA committee to review concerns and make needed updates.

If you require additional specific information or need clarifications, you may contact Kevin Gappert, Unit Aviation Manager for the Fire and Aviation Division of the Eastern Montana Fire Zone (EMFZ), via: phone at (406) 233-2909 office or (406) 853-5163 cell; email at kgappert @blm.gov or write him at BLM, 111 Garryowen Road, Miles City, MT 59301.

Sincerely,

M. Elaine Raper
District Manager

OFFICE OF THE GOVERNOR
STATE OF MONTANA

STEVE BULLOCK
GOVERNOR

ANGELA MCLEAN
LT. GOVERNOR

RECEIVED
MAY 02 2014
BY: D. Stern

April 28, 2014

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd
Fort Worth TX 76137

Dear Manager:

I am writing you on behalf of the State of Montana to voice our concerns with the proposal to expand the Powder River Military Operating Area (MOA). I understand that a robust national defense is founded on the proper training of our military. However, this large airspace expansion as proposed raises several concerns that will negatively impact our State.

Safety

Communications/radar – communication capability and radar services are limited to altitudes above those commonly flown by Visual Flight Rules (VFR) aircraft. This prevents a pilot from communicating with or being seen by Air Traffic Control to be alerted to activity in the area. Additional communication and radar capability would enhance safety for aircraft transiting the area. Airspace within the proposed expansion is jointly controlled by the Denver, Minneapolis, and Salt Lake Air Route Traffic Control Centers (ARTCC). High speed military aircraft can transition between these three centers in a short period of time. Coordination between these high speed military aircraft, general aviation (GA) aircraft, and three ARTCC's further complicates the issue of no communication or radar in the area. During LFE operations, a distinct plan must be in place to designate which ARTCC is in charge.

AM-3

SA-4

See and Avoid – by Federal Aviation Regulations, VFR aircraft operating below 10,000 feet are limited to airspeeds of 250 knots to allow the VFR pilot to visually identify other aircraft and take corrective or evasive action to avoid a collision. Allowing high speed military aircraft to operate in excess of 250 knots in the same airspace as GA aircraft is inherently dangerous and compromises the "see and avoid" concept.

SA-7

STATE CAPITOL • P.O. BOX 200801 • HELENA, MONTANA 59620-0801
TELEPHONE: 406-444-3111 • FAX: 406-444-5529 • WEBSITE: WWW.MT.GOV

303

Induced Congestion – the "Gaps" will only serve to concentrate air traffic in corridors and induce congestion that otherwise would not exist. Forcing multiple VFR aircraft to operate in a confined area is fundamentally unsafe particularly during periods of low visibility. SA-25

NOTAM's – a MOA may be activated by a Notice to Airmen (NOTAM) with only 2 hours' notice. The average GA aircraft has an estimated flight duration of 4-6 hours. The MOA may be activated during a GA flight without the pilot having knowledge of this updated information or having the ability to receive it in a timely fashion. AM-12

Flight Training – a prudent flight instructor will not send a student pilot into an active MOA. The workload of a student pilot in the cockpit is challenging enough without the added distraction of flight in a MOA. SO-26

Economic Impacts

Eastern Montana Resource Development Areas– natural gas liquids, crude oil and coal are produced and/or transported in this area resulting in significant aviation activity. GA aircraft that are based at an airport underlying this MOA will be impacted by not having unrestricted 24/7 access to airspace. Some of those may choose to relocate, creating not only logistical but economic issues as well. This development has changed the traffic patterns in the area. The FAA should perform a traffic study to determine if there is a need for an air corridor between Baker, MT and Gillette, WY. SO-17

Airports/Aviation business – Aircraft typically choose to use local services at airports that are not affected by a MOA. There are six public use and more than 40 private use airports underneath the proposed MOA. The public use airports and associated aviation businesses rely on transient traffic for a majority of their income. Private airport owners (farmers, ranchers) utilize GA aircraft in their day-to-day operations. The proposed MOA will reduce revenue and impact efficiency of these business entities by severely restricting their ability to operate and possibly result in moving commerce to sites outsid the proposed MOA. SO-10

Access

Instrument Flight Rules (IFR) – by current practice, IFR traffic in an active MOA is prohibited by ARTCC. Procedures for "recalling" military aircraft to allow for civilian departures and arrivals must be agreed to by both agencies and clearly identified. AM-1

Air Traffic Control Assigned Airspace (ATCAA) – the effect of the proposed MOA a or above 18,000 feet (ATCAA) is unknown. An action to create an ATCAA will affect GA, commercial and airline operations. AM-6

Life Flight –the draft EIS states priority will be given to these operations, however, prioritization is not defined. Communication issues further complicate an already complex set of circumstances and any delay to life flight operations is unacceptable. SA-18 SA-19 SO-5

303

Aerial Applicators- The proposed MOA will create significant problems for aerial applicators that operate in the area. Their operations fall well within the use areas and as a seasonal activity, are limited in the window during which they can and must operate.] SO-2

Mitigations

In addition to the restrictions listed in the FAA proposal, the State of Montana proposes the following mitigations concerning low altitude operations, supersonic flight, and chaff/flare expenditure over SE Montana be mandated by the FAA prior to approving the Powder River MOA expansion:

Powder River 3 MOA – restrict to the high MOA only removing the PR3 Low MOA and restrict PR3 operations to LFE only (10 days/year).] PN-2

Hardin, Colstrip, St. Labre Mission, Broadus, Ekalaka and Baker - raise the minimum altitude and radius to 5000' AGL and 5 nautical miles over these Montana communities; restrict supersonic flight over these communities to no lower than 20,000' AGL and 10 nautical miles; and raise the minimum altitude for chaff and flare expenditures to 12,000' over these communities.] DO-3 DO-4

Chaff/Flare Expenditure –restrict over the National Park Service (NPS) mitigation designation for the Little Bighorn Monument.

Supersonic - no supersonic operations within the Powder River Training Complex after 8pm Mountain Time.] PN-3

Private airfields - maintain the 1,500' AGL and 3 nautical mile restrictions over active SE Montana private airfields within the Powder River Training Complex.] AM-5

Hours of activation - develop coordination procedures that are clearly defined to include anticipated hours of operation as well as deconfliction processes for VFR aircraft.] AM-12

I am interested in continuing to work together to enjoy our freedom that open skies provide and am hopeful that the above measures will be adopted to accommodate the desires of the State of Montana. The State of Montana is committed to working with all stakeholders to develop a safe and effective airspace plan for our military.

I appreciate our Armed Forces and the service they provide to this great country.

Sincerely,

STEVE BULLOCK
Governor

Manager, Operations Support Group, ATO Central Service Center, AJV-C2
Airspace Study 14-AGL-06NR
Department of Transportation
Federal Aviation Administration
2601 Meacham Blvd.
Fort Worth, TX 76137

RE: Proposed Establishment of the Powder River Training Complex Military Operations – North Dakota, South Dakota, Montana and Wyoming

To Whom It May Concern:

The North Dakota Stockmen's Association is an 85-year-old trade organization representing nearly 3,000 North Dakota cattlemen and cattlewomen. We strive to ensure a favorable business climate and quality of life for North Dakota ranch families.

Thank you for the opportunity to comment on the proposed expansion of the Powder River Training Complex Military Operations, which would overlay eight southwestern North Dakota counties – Bowman, Slope, Grant, Adams and Hettinger Counties and the southern portions of Stark, Golden Valley and Billings Counties – and encompass approximately 28,000 square miles of air space.

North Dakota Stockmen's Association members understand the need for military operation areas and proper training of military officials within the Air Force in order to provide national security, which is paramount. However, we are opposed to the proposed expansion of the Powder River Training Complex because of the serious negative impacts it could pose to North Dakota's ranchers. Members outlined these concerns in a policy resolution adopted first in 2010, then renewed in 2013, at our organization's annual convention.

02/2014 13:13 7012232587 ND STOCKMENS ASSOCIT PAGE 03/04

305

Among members' concerns:

- **Safety for livestock industry aviators:** As you know, civilian aviation is prevalent in this area, whether it is by livestock producers checking their land and livestock or animal damage control officials controlling predators. As the North Dakota Aeronautics Commission pointed out in its comments, there is low altitude radar coverage and voice communications in this region, which shares Federal Aviation Administration Air Traffic Control (ATC) responsibilities between Salt Lake, Denver and Minneapolis ATC Centers, which creates safety issues. With the proposal of a 500-foot floor for large Air Force flights, this limitation adds to the difficulty in segregating military and civilian flight. Sharing air-space with low-flying, high-speed military aircraft with limited radar and communication services available presents a huge safety concern. — AM-3, SA-9, SO-11

- **Safety for aerial applicators.** North Dakota agriculture utilizes aviation for the aerial application of crop protection products throughout the state, including the proposed expansion area. Because Federal Aviation Administration requirements mandate that aerial applicators fly at least 500 feet above any person or structure when transitioning between fields and their airport, these pilots will be at the same altitude as large, high-speed military aircraft in the midst of military training, which could be very dangerous for all parties involved. — S0-2

- **Fire potential:** As we know, chaff and flares can occasionally fall to the ground and cause grassfires to start, particularly in the semi-arid regions of southwestern North Dakota, which receives just 14 to 16 inches of precipitation each year, according to the U.S. Geological Survey. This could put people and livestock, as well as sensitive wildlife species, in serious danger. Absent a mitigation plan, landowners and local fire crews will be the ones who have to respond to emergencies and deal with damages. — SA-5, SA-6

- **Potential medical flight interference:** The proposed training area could hinder medical flights into and out of the area. Such flights are critically important in remote, rural communities, which, in many cases, are many miles from life-saving medical services. While we appreciate the U.S. Air Force's commitment to making emergency flights a priority, relocating large military exercises out of the airspace would be difficult to do quickly, and we do not see that as a realistic option. — SO-5

- **Livestock welfare issues.** The unusual activity and additional noise that are expected to accompany the proposed expansion could be damaging to livestock. Unnaturally high levels of noise can mask more subtle sounds that they need to hear in order to survive and reproduce. They may also react with a fight-or-flight response to artificial sounds like aircraft noise and thereby use up valuable energy reserves to flee from non-existent predators. According to Dr. Temple Grandin, a world-renowned authority — BI-1, BI-2, BI-4

305

on livestock behavior and animal welfare, cattle and sheep are more sensitive than people to high frequency noises, and unexpected loud or novel noises can be highly stressful to livestock. These conclusions have been scientifically documented. Grandin noted that sheep exposed to exploding firecrackers or noise in a slaughter plant, for instance, had increased thyroid hormone levels and elevated cortisol. Similarly, T. Camp of the U.S. Department of Agriculture's Experimental Station in College Station, Texas, indicated that even a loud clanging bell from an outdoor telephone will raise a calf's heartrate 50 to 70 beats per minute.

BI-1
BI-2
BI-4

In summary, the NDSA is grateful to the men and women who sacrifice to defend our nation and our way of life and recognizes the need for the military to have appropriate training to do so. Our members also understand that that is the intent of the proposal to expand the Power River Training Complex and appreciate what the Air Force is aiming to achieve. However, the proposal as currently written would present considerable safety and well-being concerns for the people and livestock residing in this area on as many as 240 days of the year.

We hope that the Federal Aviation Administration and the U.S. Air Force recognize the significance of the concerns our organization and others have identified with this proposal and are willing to work with all stakeholders to develop a safe, efficient alternative.

Thank you for the consideration of these comments. If you have any questions, please don't hesitate to call our office at (701) 223-2522.

Sincerely,

Jason Zahn
President
North Dakota Stockmen's Association

RE: PRTC MOA Expansion

Dear Operations Support Group Manager,

Fallon Medical Complex's Board, Medical Staff, and Administration would like to collectively express concern for the proposed expansion of the Powder River Training Complex Military Operations Area. We were very discouraged to hear that a Bridger Pipeline helicopter was grounded in mid-April due to military exercises.

Granted, it was a commercial aircraft and the grounding was only for a few hours. However, we are gravely concerned that a similar incident involving medical aircraft could cause a person his/her life. Whereas, grounding the Bridger Pipeline helicopter was an annoyance to the pilot and an expense to the company, the reason that we fly out patients is because they need immediate attention at a higher level of care.

SA-19
SO-5

In other words, seconds count when we are talking about saving a human life. We do not have the luxury of time to drive them to another community to catch a flight. Since Baker is at least 85 miles from the next largest community, delaying a flight means delaying a patient's care for at least another hour in good weather.

On average, our hospital flies out about two patients a month to Billings, Bismarck, or Rapid City. All of these cities are equidistant from Baker, so it takes about 2-1/2 hours from the time that the flight service is called until the patient arrives at the receiving facility. This, in itself, is generally considered marginal when a patient is suffering from a heart attack or bleeding from a trauma. We cannot possibly accept a longer wait-time, especially on that could possibly extend up to ten hours.

307

Plus, given that the MOA is proposed to operate 240 days per year, there is a good chance that a patient's transfer could occur during a no-fly directive, given that we transfer patients during all times of the day or night. Our patients cannot choose when they require emergency care and we cannot choose when to ship them. We simply need to respond when the time is right.

It is our hope that you can see that the MOA expansion will put our community and our patients at grave risk. Baker largely thrives because of its excellent medical facility, its reputation for successfully stabilizing emergency room patients and expediently transferring them to a higher level of care. It is conceivable that the expansion could threaten not only the viability of the facility, but also the community, given that our lifeline to larger hospitals could be restricted.

All in all, it our hope that you can see that the expanded MOA would be an extreme detriment to our community. Providing health care in a rural, isolated area is difficult enough without further limiting options for obtaining timely, necessary higher levels of care for patients. We cannot underscore enough how the expansion has the potential to severely affect the health, safety and welfare of our county and our community.

Regards,

Betty Mueller

Betty Mueller, Board Chair

Airspace Study 14-AGL-06NR

Department of Transportation

Federal Aviation Administration

2061 Meacham Blvd.

Fort Worth, Texas 76137

Dear Sirs:

I am opposed to the expansion of the Powder River Military Area for three reasons- GE-2

1. This expansion would cause great danger to the local pilots flying small aircraft checking livestock. Also the pilots doing animal damage control would be in the same danger situation. SA-8 SA-9
2. The threat of starting prairie fires with the dropping of flares. SA-6
3. The dropping of chaff would have the potential of contaminating a wool crop if dropped on a flock of sheep. As a sheep producer we strive very hard to keep the wool clip free of polyester and other contaminates. If a wool clip has been contaminated the value of that wool is greatly reduced or could be valued at zero. SO-16

Sincerely yours,

David Niemi

Comments on the Powder River Training Complex Aeronautical Study

We acknowledge the FAA's role in the efforts of the Air Force to expand their training area to reduce fuel costs and continue to provide training for their pilots with this effort. We do ask that some things be clarified or considered in more detail. Training flights already occur over much of the Ashland and Sioux ranger Districts in Powder River and Carter counties, MT and Harding County, South Dakota, in the current Powder River A and B MOAs. Staff from each ranger district report they have not heard of problems as a result of the use of that airspace.

1) Use of Above Ground Level vs. Mean Sea Level

The Air Force mentioned having planes at certain elevations above the ground. One was Above Ground Level (AGL) for most flights. However, another type of training flight mentioned would use Mean Sea Level (MSL) instead. We suggest using AGL as the guide when talking about all flights unless a specific training need is identified that needs to use MSL instead.

AM-32

2) Archaeology

It is our understanding that the North and South Cave Hills land units of the Forest Service are considered sacred to the Lakota, Mandan, Hidatsa and Arikara tribes and are used for vision quests, solitude, etc. These three land units are part of the Sioux Ranger District and are located in Harding County, South Dakota. The Sioux Ranger District consists of eight land units, five of which are located in South Dakota and the remaining three in southeast Montana, in Carter County. We recommend that you may wish to contact the tribes regarding those areas they might consider sacred.

CU-2

There appears to be no analysis on the effects of noise and vibration, related to sonic booms and low altitude fly-overs, to the geologic units where rock art sites currently listed on the National Register of Historic Places are located. The sites are listed in tables, but no analysis is disclosed if there are potential effects. Also, there does not appear to be analysis of effects to four potentially eligible historic structures located within the analysis area - Jessie Elliott Guard Station, Tri-point Lookout, and the Molstad Cook shack located on the Sioux Ranger District; and Poker Jim Lookout and Whitetail cabin located on Ashland Ranger District. The concern is the potential effects of noise and vibration to the rock art sites and historic structures located on National Forest System land within the proposed project area. Please consider the effects of noise and vibration to these resources.

CU-5

3) Botany

The following species of sensitive plants should be considered in the FAA decision making process:

309

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
		ND	SD	MT	WY		
Nutall desert-parsley	Lomatium nuttallii			Big Horn, Rosebud		USFS Species of Interest	Open, rocky pine woodlands in mid to lower elevation.
Pregnant sedge	Carex gravid var. gravida			Big Horn, Carter, Powder River, Rosebud		USFS	Green ash ravines and wooded draws.
Visher's buckwheat	Eriogonum visheri			Carter		USFS	Barren rock outcrops or clay outwash.
Barr's milvetch	Astragalus barrii			Powder River, Rosebud		USFS	Gullied knolls, buttes, & barren hilltops, often on calcareous soft shale and siltstone.
Ovalleaf milkweed	Asclepias ovalifolia			Carter		USFS	Prairies and woodlands in sandy, gravelly or clayey soils.
Prairie gentian	Gentiana affinis		Harding			USFS	Wet meadows, shores, seeps, springs.

309

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
							and low prairie.
Mountain bluebells	Mertensia ciliata		Harding			USFS	Forested slopes, damp thickets, moist valley bottoms.
Small yellow lady's slipper	Cypripedium parviflorum			Carter		USFS	Fens, damp mossy woodlands, seepage areas.

4) Fire, Fuels, and Fire Suppression, and Emergency Aircraft

The Forest Service recommends using a combination of the National Fire Danger Rating System's (NFDRS) Adjective Fire Danger Rating and the National Weather Service's Red Flag Warning system to determine times when flare use should be suspended. The NFDRS Adjective Fire Danger Rating is based on indices that track season long and short term fire danger trends by combining calculated Staffing Levels and Ignition Component. We suggest utilizing Miles City Dispatch calculated values for determining the Adjective Fire Danger Rating and suspending flare use between 1000 and 2100 during days of Very High and Extreme Adjective Ratings or raising the minimum altitude for flare deployment to 5000 feet during Very High and Extreme rating days. Very High and Extreme ratings tend to correlate with the potential for numerous fire starts and large fires thus representative of environmental conditions where flares used at low altitude would cause a fire. Additionally, the National Weather Service issues Red Flag Warnings when predicted wind speed, minimum relative humidity and/or lighting activity reach critical thresholds for a particular fire weather zone. The Forest Service recommends suspending flare use during Red Flag Warning issuances.

SA-6

During fire season (June-September) how much notice will Miles City Dispatch be given of planned exercises. We would ask that large quarterly exercises be scheduled in June or late September to avoid the peak of fire season and fire aviation traffic which is typically mid-July through the first part of September to reduce airspace traffic conflicts.

AM-33

We have reviewed the July 2008 scoping comments submitted by the Bureau of Land Management (BLM) and concur and incorporate those comments into our recommendations. The Forest Service and BLM jointly work together with other Federal, Montana State and local

309

departments, such as the Department of Natural Resources and Conservation, as well as the Bureau of Indian Affairs in the management and suppression of fire in the Eastern Montana Fire Zone (EMFZ). Due to the large number of cooperating agencies in EMFZ and the need for rapid fire management response, we want to emphasize the need for quick, efficient and effective communication between the Air Force and Miles City and/or Billings Dispatch Center(s).

5) Recreation

The Ashland and Sioux ranger districts on the Custer National Forest are very popular destinations for hunters. National Forest System (NFS) lands provide an important recreation opportunity for hunters both in local communities and those who travel from neighboring states. Families return annually to hunt on these particular lands. Hunting provides individuals an important connection to the land, an opportunity to engage in individual and family hunting traditions, and a way to provide meat for oneself and family. During the various hunting seasons, use of the Forest occurs throughout the week, though use is heaviest on weekends. Noise from aircraft has the potential to negatively affect hunters and their prey.

SO-9

6) Wildlife

Several wildlife species need to be considered in the FAA decision. Some of these species are considered Northern Region Forest Service sensitive species, and others are Forest Plan Habitat Indicator Species (also known as Management Indicator Species (MIS)), and other species are Forest Plan key species. Forest Service sensitive species are analyzed pursuant to the National Forest Management Act (NFMA) to determine whether the effects of an action to these species would cause a trend toward listing under ESA. The analysis of Habitat Indicator Species and Key species ensure an action is consistent with the Custer National Forest Land and Resource Management Plan (Forest Plan) pursuant to NFMA. These species are indicated in the table below.

BI-8

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
		ND	SD	MT	WY		
Blue-gray gnatcatcher	*Polioptila*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Sensitive	Open stands of juniper and limber pine with intermixed sagebrush.
Loggerhead shrike	*Lanius ludovicianus*		Harding	Big Horn, Carter, Powder River,		USFS, Sensitive	Grassy pastures that are well grazed, nest in shrubs or small trees, preferably

309

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
				Rosebud			thorny such as hawthorn.
Long-eared myotis	*Myotis evotis*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Sensitive	Use a variety of habitats but are strongly associated with coniferous forests.
Long-legged myotis	*Myotis volans*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Sensitive	Primarily a coniferous-juniper forest bat found at moderate elevations (≥6000ft) but may also inhabit riparian cottonwood bottoms and desert areas.
Greater Short-horned lizard	*Phrynosoma hernandesi*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS' Sensitive	Areas with short, sparse grass or sagebrush; flats with pebbly or stony soil; and rock outcrops.
Western kingbird	*Tyrannus verticalis*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Open or partially open country with scattered trees, including agricultural lands.
Lark sparrow	*Chondestes grammacus*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Open or partially open country with scattered trees, including agricultural lands.
Bullock's oriole	*Icterus bullockii*		Harding	Big Horn, Carter, Powder River,		USFS, MIS	Open deciduous woodland and riparian areas.

309

Common Name	Scientific Name	Project Area States and Counties of Known Occurrence				FED	Habitat
				Rosebud			
Yellow warbler	*Dendroica petechia*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Brushy riparian especially with willows.
Ovenbird	*Seiurus aurocapillus*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, MIS	Mid-late successional, closed-canopied deciduous or deciduous/conifer forests with limited understory.
Golden eagle	*Aquila chrysaetos*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Key Species	Open hilly to mountainous areas. habitat
Merlin	*Falco columbarius*		Harding	Big Horn, Carter, Powder River, Rosebud		USFS, Key species	Patchy shrub/grassland habitats with large trees to support nesting (secondary nester).

A Biological Assessment should be prepared, pursuant to the Endangered Species Act. Please make the Biological Assessment available for review.

The Forest Service conducts flights for wildlife surveys (e.g. goshawk nest surveys), reconnaissance flights after lightning activity or infrared flights to determine hot spot activity during fire operations. Please clarify what procedure will be used when coordinating flights with the DoD flight scheduling desk at Ellsworth AFB. The nature of some of these flights does not warrant requesting a TFR due to the limited amount of flight time required. How much consideration and how far in advance would we be able to schedule flights to avoid conflicts with planned exercises?

AM-12

309

Rocky Mountain Region

Comments on the Powder River Training Complex Aeronautical Study

Emergency Use of Airspace

The Air Force proposal identifies that emergency related airspace needs for life flight or firefighting activities would take priority over training exercises and that exercises would be relocated or aborted as needed to accommodate these uses. We recommend that the USFS, FAA, and US Air Force enter into an MOU for this purpose similar to the MOU with the Montana BLM identified in the Air Force DEIS.

Effects to Wildlife

This proposed project will allow Air Force flights over portions of the Thunder Basin National Grassland that have been designated By the State of Wyoming as Core Sage Grouse Habitat. This habitat has been designated throughout Wyoming in an effort to provide protection to a significant portion of the states sage grouse population. Since this species has been identified as being "warranted but precluded" from listing under the Endangered Species Act, it has been listed as a U.S. Forest Service Region 2 Sensitive Species. Wildlife that fall into this category receives additional management consideration by the Forest Service. Adverse impacts are avoided or minimize as much as possible to prevent a continued downward trend in populations and habitat condition.

To accomplish these goals, the Forest Service has been a partner in the development of sage grouse conservation plans and the State of Wyoming's Greater Sage Grouse Core Population Strategy. This strategy provides stipulations and guidelines designed to protect the sage grouse and its habitat. We would encourage the Air Force to review this strategy as well as the Northeast Wyoming Sage Grouse Conservation Plan. Information from both of these plans can be useful in designing their proposed project to minimize impacts to sage grouse and their habitat. This information, used in concert with the above recommendations should provide a framework to assist the State of Wyoming and the U.S. Forest Service manage sage grouse habitat effectively, while allowing the Air Force to conduct their training missions. The long term management of effective habitat and a stable to growing population of sage grouse is the key to keeping this species off of the Endangered Species list.

SO-27

Effects to Recreation Use

We are concerned about the Air Force conclusion that there would be no negatives to recreational land use under the proposal. Many of our visitors come to the National Forests and Grasslands to enjoy nature. For many, this includes freedom from noise and other human impacts. The FAA should note that increasing training overflights and introducing sonic booms would conflict with these goals and would potentially have adverse impacts to visitors to the National Forests and Grasslands.

SO-9

Use of Chaff and Flares

It appears from the Air Force proposal that over the next ten years about 300,000 chaff bundles of 5 million fibers each (1.5 trillion total fibers) will be dropped on lands underneath the training activities. The FAA should clarify if this is the maximum amount of fibers to be permitted. We note that the useful training life cycle of chaff ends after it forms a cloud and is then deposited on the land and that chaff is

309

defined as ordnance. The FAA should identify the permitting processes for this chaff ordnance disposal on lands beneath the airspace.

We understand that these fibers generally do not degrade chemically. Instead, they break down mechanically, apparently into smaller, more numerous fibers. Information on the potential for wildlife or humans to inhale or ingest these smaller, mechanically broken down fibers appears to be limited and could be improved through a monitoring effort to determine the long term environmental effects of these fibers. We understand that biodegradable chaff has not proven feasible. It would be useful to know if other training options, such as electronic simulation of chaff clouds could be investigated. BI-8

Management of any clean up of litter from the chaff on National Forest System lands, how any fires from flares will be suppressed and paid for, and how any dud flares would be handled should be considered in a Memorandum of Agreement. SA-5

Master Agreement

A Memorandum of Agreement (MOA) for this project needs to be completed with the US Forest Service.

310

Rejection of proposed PR2 MOA near Ellsworth AFB South Dakota urged in the strongest possible terms - not lawful.

All of the low level airspace in the U.S. is badly needed for air transport. In previous reviews of this and other proposed MOAs, the proposed PR2 and any future MOA additions would be an obstruction of air commerce; or highly unlawful.

AM-6

The U.S. Air Force must figure out how to use its existing MOAs more efficiently without adding any to prevent obstruction of air commerce. The U.S. Air Force disengagement from the proposed PR2 MOA addition and all future MOA additions are urged as the only lawful choice using existing MOAs only.

AM-6
PN-3

Note: unencumbered, unimpeded transportation of all types in the U.S. is guarranted by the U.S. Constitution; known as the Commerce Clause.

Respectfully submitted,

Terry D. Welander

TO: Manager, Airspace Study - Operations Support Group
FROM: Southwest Healthcare Services, Bowman, ND
DATE: April 30, 2014
SUBJECT: Powder River Training Areas

We at Southwest Healthcare are very concerned about the proposed Powder River training expansion areas. Our community has undergone great changes associated with the Bakken and Williston oil activities in the state. High salary jobs are increasing; population is growing; and air traffic is increasing with local communities trying to keep pace with the demand in services. Rural fire departments, hospital and clinic staff, ambulance and EMT staff, and emergency response offices are all impacted by this increase in demand.

We may now be required to do more with the Powder River Area which is Area #3 and is directly over our community! The potential for aircraft mid-air or crashes is very real with the proposed 500 foot altitude restriction. Also, fire potential is a major concern with flare dropping operations. How will these area restrictions impact local health services such as *med-evac* and life flights to transport patients to larger, higher level facilities?

SA-1
SA-5
SA-18
SA-19

Some recommendations that could greatly reduce these impacts include the following:

1. NO area #3, or a "high area" designation
2. . Raise area floors to 8000 feet
3. 500 feet restriction 1 day/week instead of 5 days/week

We do appreciate your attention to this matter which we consider very important to our facility and our communities.

Respectfully,

H

Becky Hansen, CEO

United States Senate

WASHINGTON, DC 20510

May 22, 2014

Michael P. Huerta
Administrator
Federal Aviation Administration
800 Independence Avenue SW
Washington, DC 20591

Dear Administrator Huerta:

As you know, the Air Force has worked for many years to develop the Powder River Military Training Range proposal. I am encouraged by the fact that the Air Force has designed several sections of the Powder River range to avoid civilian traffic, including section four, where military airspace would not extend below 12,000 feet mean sea level (MSL). I hope that you will work with the Air Force to mitigate some additional concerns that will maximize the availability of airspace for civilian use while still accommodating the needs of the men and women of the Air Force.

I am specifically concerned with section three of the proposed range, which would involve military traffic as low as 500 feet above ground level (AGL). Such a low altitude greatly complicates civilian use of the airspace and could adversely affect:

- Weather modification activities;
- Air ambulance services; and
- Commercial traffic, especially in and out of the Bowman airport.

SA-15
SO-28
SA-19
AM-21

Better communication is essential to minimizing the effects of military use of the Powder River airspace on civilian users. I welcome the Air Force proposal to create a communications network to provide real-time airspace status to civilian pilots and two-way communication with the scheduling agency. I also believe the Air Force must increase efforts to communicate with the public when it will use the range, perhaps through a hotline or website, and I hope that the FAA will work with the Air Force to ensure the public is notified to the greatest extent possible when the range is in use. Finally, the FAA should encourage the Air Force to establish procedures that allow for maximum civilian use of the airspace in question, including the use of memorandums of understanding with civilian users, the deactivation of the range when the Air Force does not require it, and the development of procedures to accommodate civilian emergency flights.

AM-3

AM-6

Thank you for your attention to this matter. If you have questions, please contact Josh Carter of my staff at 202-224-2551.

Sincerely,

John Hoeven
U.S. Senator

EAA
THE SPIRIT OF AVIATION

April 28, 2014

Mr. Kent M. Wheeler
Manager, Operations Support Group
ATO Central Service Center, AJV-C2
Department of Transportation
Federal Aviation Administration
2601 Meacham Boulevard
Fort Worth, Texas 76137

In Re: Airspace Study 14-AGL-06NR, Powder River Training Complex Special Use Airspace

Dear Mr. Wheeler:

EAA (the Experimental Aircraft Association) is the world leader in recreational aviation. With an international membership of more than 180,000 people in more than 100 nations, EAA brings together pilots, aircraft owners, and aviation enthusiasts who are dedicated to sharing *the Spirit of Aviation* by promoting the continued growth of aviation, the preservation of its history and a commitment to aviation's future.

EAA is commenting on the proposed Powder River Training Complex (PRTC), which, if approved, will be the largest Special Use Airspace (SUA) in the United States. The United States Air Force (USAF) determined that their training mission requires a four-fold expansion of the existing Powder River Military Operating Area (MOA). The new PRTC would cover approximately 28,000 square miles of Montana, Wyoming, and North and South Dakota, and includes airspace over 39 general aviation (GA) airports and nearly 300 based civil aircraft.

On behalf of our membership, EAA supports and encourages the mission of the USAF and recognizes the need for appropriate training airspace. However, we are also committed to general aviation safety and access, and we have concerns that the proposed PRTC could provide a significant detriment to airports, pilots, student pilots, and aviation businesses located underneath the SUA. We are also concerned that without proper safety considerations in place, non-participating VFR operations could present a safety hazard to both GA and USAF pilots.

EAA hopes that, in the best interest of aviation safety, local economic activity, and airspace access, FAA will consider the following requests and recommendations prior to approving the expansion of the PRTC:

[redacted]

2. 2014 4:05PM EAA OSHKOSH, WI NO. 6135 P. 3

313

Establishment of Advisory Communication Services for the PRTC

The most pressing safety requirement for protecting non-participating VFR traffic, locally based or transient, is the creation and implementation of real-time MOA status advisories distributed through multiple channels. EAA requests that the USAF develop a continuously-operational communications plan that will allow pilots on the ground and in the air to immediately determine the status of the MOA. Such a plan might include a website, a toll-free telephone hotline, and/or an automated VHF broadcast, **before** the FAA approves the PRTC expansion. This system would ideally be continuously updated with information including current MOA status, as well as planned activation and deactivation times.

EAA understands that the establishment of such a system is vital and necessary to promoting situational awareness for GA pilots, especially because the dissimilar operating envelopes of military aircraft and GA aircraft make "see and avoid" difficult at best to practice.

A comprehensive communications plan would also help mitigate some of the deleterious economic effects of the proposed PRTC expansion. Transient GA traffic is an important source of income for many businesses based at airports under the proposed SUA, and EAA believes that without a convenient and accurate source of information, the majority of transient traffic would simply avoid the charted MOA due to safety concerns. This avoidance would immediately harm aeronautical businesses and their communities.

AM-1
AM-3
AM-6
AM-12

Establishment of Full-Coverage, Two-Way VHF Communication for the SUA

EAA requests that the USAF establish a radio communication network that will permit GA traffic and the USAF to communicate over VHF frequencies across the expanse of the proposed PRTC. In contrast to military aircraft, nearly all GA aircraft use VHF exclusively and it is important that these GA aircraft are able to communicate with military range controllers. Additionally, a range-wide system of VHF radio repeaters would facilitate the automated status broadcasts previously referenced.

AM-3

Temporary, Uncharted Gap MOAs

EAA requests that the proposed Gap MOAs remain uncharted and become activated as temporary MOAs, following the guidance for establishing temporary MOAs outlined in FAA Order 7400.2K, section 25-1-7. The relevant passage states that temporary MOAs are appropriate for military operations "that supplement routine training" and for "short-term military exercises," both of which succinctly describe the Large Force Exercises that the USAF plans to conduct once a quarter for a few days per exercise.

Leaving the Gap MOAs uncharted would provide VFR GA traffic with a safe way to transit the area of an active MOA without having to either fly directly through it or fly completely around it, which reduces the inconvenience and imposition of the MOAs to the local GA community.

AM-34

[redacted]

313

While Order 7400.2K section 25-1-7(b) does allow that if "it is determined that the need for a temporary MOA will occur on a regular and continuing basis, the airspace should be considered for establishment as a permanent MOA," EAA does not believe that a few days of usage for Large Force Exercises four times a year, totaling nine or 10 days annually by the USAF's own prediction, reaches the standard of "regular and continuing."

Charted MOA Active Hours That Represent Planned Airspace Usage

The current proposal for the PRTC includes charted MOA activity durations that are not consistent with the USAF estimates of actual usage. For example, the Monday through Thursday charted activity times for PR3 Low MOA are 0730-1200 and 1800-2330—a total of 10 hours—while the USAF estimates daily use to be only three hours. EAA understands that the discrepancy between charted times of activity versus actual use time gives the USAF flexibility in launching and recovering sorties, but we believe that the inflating charted activity times detracts from the public's ability to confidently use the airspace for a larger-than-necessary portion of the day. EAA requests that the charted activity times be amended to reflect estimated usage times. We also respectfully note that should the charted times be inadequate on rare occasions, the USAF always has the option of extending or altering the MOA activity times by NOTAM.

PN-5
AM-6

Summary

The proposed PRTC is a massive Special Use Airspace situated over communities with robust GA communities that provide recreational flying, flight training, medivac services, agricultural flying, aircraft maintenance, business travel, and cargo transport for their host communities. EAA requests that the FAA consider and implement our recommendations in the hopes that the flight safety risks presented by the PRTC, as well as the negative economic consequences, will be mitigated for these communities.

Respectfully Submitted,

Jonathan Harger

May 21, 2014

RE: Powder River Training Complex

Dear Administrator Huerta;

This entire comment process has been tainted and needs to be re-opened to accept electronic comments as is currently being done with the Cheyenne MOA comments. I was told by the FAA Central ATO that electronic comments were not possible!

Another issue is the EAS that was conducted by the USAF in2006. It did not fully address the concerns of the oil & gas industry. This has also changed significantly over the last 10 years, as 10% of the current US consumption of crude oil is produced in this area.

With the upturn in our area economy due to the oil & gas industry, our airport has become one of the busiest in eastern Montana with over 6,000 operations per year.

Flight instruction has increased immensely at our airport and will not be sustainable with this proposed MOA. This will cost jobs at our airport, as well as fuel sales. Remember, flight instruction is where the food chain for aviation starts!! Without pilots, we do not need airplanes, airports, or the FAA. There is a massive pilot shortage coming.

The FAA cannot justify the Powder River Training Complex after spending $30 million in ADAP funds in Montana alone over the last 20 years on the airports that lay beneath this massive proposed MOA. Bowman, ND is currently spending over $20 million on a new airport to provide services for the oil & gas industry. That's over $50 million dollars!!!

SO-10

The USAF says they will "share" airspace, as long as they can have it on their schedule, prime civilian use times. They have not one damn thing to cooperate with the current Powder River MOA! Ellsworth AFB even issued a "TFR" no fly zone around the last accident site, and kept in place for over 30 days.

On February 11, 2014, a Phenom 300 was cleared direct thru the Powder River MOA, which was active at the time. With no communications or radar coverage in this area, this could have been disastrous had an over flying airline not relayed message to turn 180 degrees immediately!!

AM-3
SA-1

I have enclosed two letters that I sent in to the ATO during the comment period for your review.

Please don't destroy our airport, KBHK, as I have worked for over 36 years to build it to what it is today.

Comment and Response Matrix – FAA Aeronautical Inputs

Comment	*Description*	*Response*
1	Modify Gap B MOA/ ATCAA as depicted on Attachment 1 to avoid Gap B extending across Gap C to prevent usage of V-491 when Gap B MOA/ A TCAA is active and the Gap C MOA/ ACT AA is not.	The Air Force redesigned the Gap B and C intersection. The supporting coordinates are: Gap B High and Low: Beginning at Lat. N46°08 ' 55", Long. Wl05°27'24"; Counter Clockwise along the MLS VOR/DME, 25 NM arc; to Lat. N46°18'08", Long. W105°21'51"; to Lat. N46°03'21", Long. W104°31'24"; to Lat. N45°52'07", Long. W103°44'36"; to Lat. N45°35'42", Long. W103°01'21"; to Lat. N45°29'36", Long. W103°02'33"; to Lat. N45°29'05", Long. W103°17'10"; to Lat. N45°37'48", Long. W103°52'28"; to Lat. N45°53'08", Long. W104°33'46"; to the point of beginning. Gap C High: Beginning at Lat. N46°22'24", Long. W102°56'07"; Counter Clockwise along the DIK VORTAC, 30 NM arc; to Lat. N46°2l'48", Long. W102°41'42"; to Lat. N45°48'35", Long. W102°44'37"; to Lat. N45°30'13", Long. W102°44'07"; to Lat. N45°29'36", Long. W103°02'33"; to Lat. N45°35'42", Long. W103°01'21 "; to Lat. N45°47'47", Long. W102°59'01"; to the point of beginning.
2	Deny the Gap C low MOA (airspace below 12,000MSL) due to the conflict with V-491 and the excessive impacts to traffic by losing that route. Minneapolis Center does not support approval of the Gap C Low MOA (MOA airspace below 12,000MSL) even if limited to Large Force Exercises. In addition: The base of the Gap C MOA should be raised to 12,000 to	The Air Force removed the Gap C Low MOA.

	coincide with the base of the Powder River 4 MOA. The eastern tip of the Gap B should be "clipped-off' and added to Gap C (See Fig 3-l).This would allow low-altitude aircraft to use V -491 while the Gap B low MOA is active.	
3	Amend the Times of Use to read: i. Powder River 2 MOA: By NOTAM 2 hours in advance, 0730-1200 and 1800-2330 Monday-Thursday, and 0730-1200 Friday, Other Times by NOTAM 4 hours in advance. ii. Powder River 1, 3, 4 MOA's: Intermittent by NOTAM 4 hours in advance, 0730-1200 and 1800-2330 Monday-Thursday, and 0730-1200 Friday, Other Times by NOTAM 4 hours in advance. iii. Gap A, B, C MOAs: By NOTAM 4 hours in advance, Large Force Exercise Only. In addition: The proposal request times of use to be published for airspace to be from 0730-1200 and 1800-2330 Mountain Time, Monday- Thursday; 0730-1200 Mountain Time, Friday; other times by NOTAM. Salt Lake center requests PR-2 have these published times and all the rest by NOTAM.	The Air Force revised the Times of Use to the following: For 1A Low, 1B High/Low, IC Low, 1D High/Low; 2 High/Low, 3 High/Low; and 4 High: - By NOTAM 2 hours in advance 0730-1200 and 1800-2330 Monday-Thursday and 0730-1200 Friday; other times by NOTAM 4 hours in advance. For 1A High, 1C High, Gap A High/Low, Gap B High/Low and Gap C High: - By NOTAM 4 hours in advance.
4	Require that Ellsworth AFB have a means of communication with participating aircraft at all altitudes to facilitate a near immediate modification or recall of active airspace if necessary to accommodate arrivals and departures to/from underlying or adjacent airspaces, including the new.	The Air Force intends to establish radio coverage across the PRTC with training aircraft to support agile recall of active airspace. The current coverage for all high-altitude segments and PR2 low is considered effective. The shortfall in coverage for PR1 and PR3 low will be resolved after a determination is made on the airspace action.
5	Require that Ellsworth staff a position to manage real-time activation, use, modification, recall, and return of the proposal airspace as discussed in section H [should read G] "ATC Services" above.	The Air Force intends to establish a focal point responsible for dynamically coordinating the segmentation of the airspace; changing the base or ceiling of the airspace to support nonparticipants requiring minimal delay.
6	Boundary modification (cut-out) of the PR2 low and high MOAs.	The Air Force enlarged the cutout exclusionary area in PR2 high and low-altitude area for Hulett WY (W43). The supporting coordinates are: PR2 High and Low: Beginning at Lat. N45°59'27", Long. Wl05°45'07";

		Counter Clockwise along the MLS VOR/DME, 25 NM arc; to Lat. N46°08'55", Long. W105°27'24"; to Lat. N45°53'08", Long. W104°33'46"; to Lat. N45°37'48", Long. W103°52'28"; to Lat. N45°29'05 ", Long. W103°17'10"; to Lat. N45°03'44", Long. W103°17'58"; to Lat. N44°48'05", Long. W104°15'25 "; to Lat. N44°50'57", Long. W104°35'41"; to Lat. N44°47'04", Long. W104°46'22"; to Lat. N44°42'03", Long. W104°49'27"; to Lat. N44°38'57", Long. W104°48'43"; to Lat. N44°33'01", Long. W105°10'34"; Counter Clockwise along the GCC VOR/DME, 20 NM arc; to Lat. N44°39'45", Long. W105°23'20"; to Lat. N44°47'12", Long. W105°30'41"; to the point of beginning.
7	During large force exercises Gap MOAs and ATCAA's would have an extreme impact to users. Air Force must comply with the AIR FORCE INSTRUCTION 11-214 AIR OPERATIONS RULES AND PROCEDURES Dated 14 A UGUST2012 "Large Force Exercise--Training where more than 1 0 aircraft are operating in the assigned airspace" to be considered a large force exercise when scheduling the GAPS and other airspace.	The Air Force intends to comply with the Air Force Instruction 11-214 guidance for Large Force Exercises.

315

Federal Aviation Administration

Memorandum

Date: July 25, 2014

To: Lt Col Richard Miller, US Air Force Representative (AFREP), Air Traffic Organization (ATO) Central Service Center, ASW-910

From: Dr. John A. Wilucki, Air Traffic Representative (ATREP), Operations Support Group, ATO Central Service Center, AJV-C23

Subject: Aeronautical Study Consultations, Powder River Training Complex, Military Operations Area, 14-AGL-06NR

The US Air Force (USAF) submitted the Powder River Training Complex (PRTC) Military Operations Airspace (MOA) Airspace Proposal (AP) to the Federal Aviation Administration (FAA) for consideration. The submission was processed using the Order 7400.2K, Procedures for Handling Airspace Matters. The process includes Aeronautical Studies of the AP by the affected air traffic facilities as covered in Order 7400.2K Part 5, Chapter 21, Section 6.

The procedures in Order 7400.2K, Part 5, Chapter 21, Section 5 covers the Regional/Service Area Office Actions for the processing requirements of items such as issues brought forward by the facilities identified during the Aeronautical Studies. Airspace issues identified during the Aeronautical Studies were provided to the USAF (Attach 1).

The Central Operations Support Group (COSG) and the airspace Proponent coordinated on the issues identified during the Aeronautical Studies (Attach 2). The coordination between the agencies was pre-decisional. The communication or conclusions from coordination provided for in 7400.2 with the Proponent does not constitute a decision or represent an approval by the FAA of the airspace action. The coordination concentrated on investigating ways for the Proponent to lessen the potential aeronautical impacts captured during the studies and/or resolve problem areas. After the USAF consulted with the FAA on the airspace issues, a conclusion was reached that the following revisions to the AP would decrease aeronautical impacts on the NAS.

1. Modify Gap B MOA/ATCAA as depicted on Attachment 1 to avoid Gap B extending across Gap C to prevent usage of V-491 when Gap B MOA/ATCAA is active and the Gap C MOA/ACTAA is not. 1

- The Proponent redesigned the Gap B and C intersection. The supporting coordinates are:

315

2

Gap B High and Low. Beginning at Lat. N46°08'55", Long. W105°27'24";
Counter Clockwise along the MLS VOR/DME, 25 NM arc;
to Lat. N46°18'08", Long. W105°21'51";
to Lat. N46°03'21", Long. W104°31'24";
to Lat. N45°52'07", Long. W103°44'36";

to Lat. N45°47'47", Long. W102°59'01";
to the point of beginning.

2. Deny the Gap C low MOA (airspace below 12,000MSL) due to the conflict with V-491 and the excessive impacts to traffic by losing that route. Minneapolis Center does not support approval of the Gap C Low MOA (MOA airspace below 12,000MSL) even if limited to Large Force Exercises.

In addition:
The base of the Gap C MOA should be raised to 12,000 to coincide with the base of the Powder River 4 MOA. The eastern tip of the Gap B should be "clipped-off" and added to Gap C (See Fig 3-1).This would allow low-altitude aircraft to use V-491 while the Gap B low MOA is active.

- The Proponent removed the Gap C Low MOA.

2

3. Amend the Times of Use to read:

i. Powder River 2 MOA: By NOTAM 2 hours in advance, 0730-1200 and 1800-2330 Monday-Thursday, and 0730-1200 Friday, Other Times by NOTAM 4 hours in advance.

ii. Powder River 1, 3, 4 MOA's: Intermittent by NOTAM 4 hours in advance, 0730-1200 and 1800-2330 Monday-Thursday, and 0730-1200 Friday, Other Times by NOTAM 4 hours in advance.

iii. Gap A, B, C MOAs: By NOTAM 4 hours in advance, Large Force Exercise Only.

In addition:
The proposal request times of use to be published for airspace to be from 0730 - 1200 and 1800 -2330 Mountain Time, Monday - Thursday; 0730 - 1200 Mountain Time, Friday; other times by NOTAM. Salt Lake center requests PR-2 have these published times and all the rest by NOTAM.

- The Proponent revised the Time of Use.

3

315

For 1A Low, 1B High/Low, 1C Low, 1D High/Low; 2 High/Low, 3 High/Low; and 4 High.

- By NOTAM 2 hours in advance 0730 - 1200 and 1800 -2330 Monday - Thursday and 0730 - 1200 Friday; other times by NOTAM 4 hours in advance.

For 1A High, 1C High, Gap A High/Low, Gap B High/Low and Gap C High.

- By NOTAM 4 hours in advance.

4. Require that Ellsworth AFB have a means of communication with participating aircraft at all altitudes to facilitate a near immediate modification or recall of active airspace if necessary to accommodate arrivals and departures to/from underlying or adjacent airspaces, including the new.

- The Proponent intends on establishing radio coverage across the PRTC between the Using Agency and training aircraft to support agile recall of active airspace. The current coverage for all high-altitude segments and PR2 low is considered effective. The shortfall in coverage for PR1 and PR3 low will be resolved after a determination is made on the airspace action.

4

5. Require that Ellsworth staff a position to manage real-time activation, use, modification, recall, and return of the proposal airspace as discussed in section H [should read G] "ATC Services" above.

- The Proponent intends on establishing a focal point responsible for dynamically coordinating the segmentation of the airspace; changing the base or ceiling of the airspace to support nonparticipants requiring minimal delay.

5

6. Boundary modification (cut-out) of the PR2 low and high MOAs.

- The Proponent enlarged the cutout exclusionary area in PR2 high and low-altitude area for Hulett WY (W43). The supporting coordinates are:

6

PR2 High and Low. Beginning at Lat. N45°59'27", Long. W105°45'07";

7. During large force exercises Gap MOAs and ATCAA's would have an extreme impact to users. Air Force must comply with the ***AIR FORCE INSTRUCTION 11-214 AIR OPERATIONS RULES AND PROCEDURES Dated 14 AUGUST2012*** **"Large Force Exercise**—Training where more than 10 aircraft are operating in the assigned airspace" to be considered a large force exercise when scheduling the GAPS and other airspace. 7

- The Proponent intends on complying with the Air Force Instruction 11-214 guidance for Large Force Exercise.

Any changes or alterations of these AP revisions will require further consultations between the USAF and the FAA. Should you have any questions, please contact Dr. John Witucki, Air Traffic Representative at 817-321-7734.

APPENDIX I
NOISE

This page intentionally left blank.

APPENDIX I NOISE

Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (such as hearing loss or damage to structures) or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho- and socio-acoustic effects.

Section 1.0 of this appendix describes how sound is measured and summarizes noise impacts in terms of community acceptability and land use compatibility. Section 2.0 gives detailed descriptions of the effects of noise that lead to the impact guidelines presented in Section 1.0. Section 3.0 provides a description of the specific methods used to predict aircraft noise, including a detailed description of sonic booms.

1.0 NOISE DESCRIPTORS AND IMPACT

Aircraft operating in military airspace generate two types of sound. One is "subsonic" noise, which is continuous sound generated by the aircraft's engines and also by air flowing over the aircraft itself. The other is sonic booms (where authorized for supersonic), which are transient impulsive sounds generated during supersonic flight. These are quantified in different ways.

Section 1.1 describes the characteristics which are used to describe sound. Section 1.2 describes the specific noise metrics used for noise impact analysis. Section 1.3 describes how environmental impact and land use compatibility are judged in terms of these quantities.

1.1 QUANTIFYING SOUND

Measurement and perception of sound involve two basic physical characteristics: amplitude and frequency. Amplitude is a measure of the strength of the sound and is directly measured in terms of the pressure of a sound wave. Because sound pressure varies in time, various types of pressure averages are usually used. Frequency, commonly perceived as pitch, is the number of times per second the sound causes air molecules to oscillate. Frequency is measured in units of cycles per second, or hertz (Hz).

Amplitude. The loudest sounds the human ear can comfortably hear have acoustic energy one trillion times the acoustic energy of sounds the ear can barely detect. Because of this vast range, attempts to represent sound amplitude by pressure are generally unwieldy. Sound is, therefore, usually represented on a logarithmic scale with a unit called the decibel (dB). Sound measured on the decibel scale is referred to as a sound level. The threshold of human hearing is approximately 0 dB, and the threshold of discomfort or pain is around 120 dB.

Because of the logarithmic nature of the decibel scale, sounds levels do not add and subtract directly and are somewhat cumbersome to handle mathematically. However, some simple rules of thumb are useful in dealing with sound levels. First, if a sound's intensity is doubled, the sound level increases by 3 dB, regardless of the initial sound level. Thus, for example:

60 dB + 60 dB = 63 dB, and

80 dB + 80 dB = 83 dB.

The total sound level produced by two sounds of different levels is usually only slightly more than the higher of the two. For example:

60.0 dB + 70.0 dB = 70.4 dB.

Because the addition of sound levels behaves differently than that of ordinary numbers, such addition is often referred to as "decibel addition" or "energy addition." The latter term arises from the fact that the combination of decibel values consists of first converting each decibel value to its corresponding acoustic energy, then adding the energies using the normal rules of addition, and finally converting the total energy back to its decibel equivalent.

The difference in dB between two sounds represents the ratio of the amplitudes of those two sounds. Because human senses tend to be proportional (i.e., detect whether one sound is twice as big as another) rather than absolute (i.e., detect whether one sound is a given number of pressure units bigger than another), the decibel scale correlates well with human response.

Under laboratory conditions, differences in sound level of 1 dB can be detected by the human ear. In the community, the smallest change in average noise level that can be detected is about 3 dB. A change in sound level of about 10 dB is usually perceived by the average person as a doubling (or halving) of the sound's loudness, and this relation holds true for loud sounds and for quieter sounds. A decrease in sound level of 10 dB actually represents a 90 percent decrease in sound *intensity* but only a 50 percent decrease in perceived *loudness* because of the nonlinear response of the human ear (similar to most human senses).

The one exception to the exclusive use of levels, rather than physical pressure units, to quantify sound is in the case of sonic booms. As described in Section 3.2, sonic booms are coherent waves with specific characteristics. There is a long-standing tradition of describing individual sonic booms by the amplitude of the shock waves, in pounds per square foot (psf). This is particularly relevant when assessing structural effects as opposed to loudness or cumulative community response. In this environmental analysis, sonic booms are quantified by either dB or psf, as appropriate for the particular impact being assessed.

***Frequency*.** The normal human ear can hear frequencies from about 20 Hz to about 20,000 Hz. It is most sensitive to sounds in the 1,000 to 4,000 Hz range. When measuring community response to noise, it is common to adjust the frequency content of the measured sound to correspond to the frequency sensitivity of the human ear. This adjustment is called A-weighting (American National Standards Institute 1988). Sound levels that have been so adjusted are referred to as A-weighted sound levels.

The audible quality of high thrust engines in modern military combat aircraft can be somewhat different than other aircraft, including (at high throttle settings) the characteristic nonlinear crackle of high thrust engines. The spectral characteristics of various noises are accounted for by A-weighting, which approximates the response of the human ear but does not necessarily account for quality. There are other, more detailed, weighting factors that have been applied to sounds. In the 1950s and 1960s, when noise from civilian jet aircraft became an issue, substantial research was performed to determine what characteristics of jet noise were a problem. The metrics Perceived Noise Level and Effective Perceived Noise Level were developed. These accounted for nonlinear behavior of hearing and the importance of low frequencies at high levels, and for many years airport/airbase noise contours were presented in terms of Noise Exposure Forecast, which was based on Perceived Noise Level and Effective Perceived Noise Level. In the 1970s, however, it was realized that the primary intrusive aspect of aircraft noise was the high noise level, a factor which is well represented by A-weighted levels and day-night average sound level (DNL). The refinement of Perceived Noise Level, Effective Perceived Noise Level, and Noise Exposure Forecast was not significant in protecting the public from noise.

There has been continuing research on noise metrics and the importance of sound quality, sponsored by the Department of Defense (DoD) for military aircraft noise and by the Federal Aviation Administration

(FAA) for civil aircraft noise. The metric L_{dnmr}, which is described later and accounts for the increased annoyance of rapid onset rate of sound, is a product of this long-term research.

The amplitude of A-weighted sound levels is measured in dB. It is common for some noise analysts to denote the unit of A-weighted sounds by dBA. As long as the use of A-weighting is understood, there is no difference between dB or dBA: it is only important that the use of A-weighting be made clear. In this environmental analysis, A-weighted sound levels are reported as dB.

A-weighting is appropriate for continuous sounds, which are perceived by the ear. Impulsive sounds, such as sonic booms, are perceived by more than just the ear. When experienced indoors, there can be secondary noise from rattling of the building. Vibrations may also be felt. C-weighting (American National Standards Institute 1988) is applied to such sounds. This is a frequency weighting that is relatively flat over the range of human hearing (about 20 Hz to 20,000 Hz) that rolls off above 5,000 Hz and below 50 Hz. In this study, C-weighted sound levels are used for the assessment of sonic booms and other impulsive sounds. As with A-weighting, the unit is dB, but dBC is sometimes used for clarity. In this study, sound levels are reported in both A-weighting and C-weighting dBs, and C-weighted metrics are denoted when used.

***Time Averaging*.** Sound pressure of a continuous sound varies greatly with time, so it is customary to deal with sound levels that represent averages over time. Levels presented as instantaneous (i.e., as might be read from the display of a sound level meter) are based on averages of sound energy over either 1/8 second (fast) or 1 second (slow). The formal definitions of fast and slow levels are somewhat complex, with details that are important to the makers and users of instrumentation. They may, however, be thought of as levels corresponding to the root-mean-square sound pressure measured over the 1/8-second or 1-second periods.

The most common uses of the fast or slow sound level in environmental analysis is in the discussion of the maximum sound level that occurs from the action, and in discussions of typical sound levels. Figure I-1 is a chart of A-weighted sound levels from typical sounds. Some (air conditioner, vacuum cleaner) are continuous sounds whose levels are constant for some time. Some (automobile, heavy truck) are the maximum sound during a vehicle pass-by. Some (urban daytime, urban nighttime) are averages over some extended period. A variety of noise metrics have been developed to describe noise over different time periods. These are described in Section 1.2.

Figure I-1. Typical A-Weighted Sound Levels of Common Sounds

1.2 NOISE METRICS

MAXIMUM SOUND LEVEL

The highest A-weighted sound level measured during a single event in which the sound level changes value as time goes on (e.g., an aircraft overflight) is called the maximum A-weighted sound level or maximum sound level, for short. It is usually abbreviated by ALM, L_{max}, or L_{Amax}. The maximum sound level is important in judging the interference caused by a noise event with conversation, TV or radio listening, sleeping, or other common activities. Table I-1 reflects L_{max} values for typical aircraft associated with this assessment operating at the indicated flight profiles and power settings.

Table I-1. Representative Maximum Sound Levels (L_{max})

Aircraft (engine type)	*Power Setting*	*Power Unit*	L_{MAX} VALUES (IN DBA) AT VARYING DISTANCES (IN FEET)

PEAK SOUND LEVEL

For impulsive sounds, the true instantaneous sound pressure is of interest. For sonic booms, this is the peak pressure of the shock wave, as described in Section 3.2 of this appendix. This pressure is usually presented in physical units of pounds per square foot. Sometimes it is represented on the decibel scale, with symbol L_{pk}. Peak sound levels do not use either A or C weighting.

SOUND EXPOSURE LEVEL

Individual time-varying noise events have two main characteristics: a sound level that changes throughout the event and a period of time during which the event is heard. Although the maximum sound level, described above, provides some measure of the intrusiveness of the event, it alone does not completely describe the total event. The period of time during which the sound is heard is also significant. The Sound Exposure Level (abbreviated SEL or L_{AE} for A-weighted sounds) combines both of these characteristics into a single metric.

SEL is a composite metric that represents both the intensity of a sound and its duration. Mathematically, the mean square sound pressure is computed over the duration of the event, then multiplied by the duration in seconds, and the resultant product is turned into a sound level. It does not

directly represent the sound level heard at any given time, but rather provides a measure of the net impact of the entire acoustic event. It has been well established in the scientific community that SEL measures this impact much more reliably than just the maximum sound level. Table I-2 shows SEL values corresponding to the aircraft and power settings reflected in Table I-1.

Table I-2. Representative Sound Exposure Levels (SEL)

Aircraft (engine type)	*Power Setting*	*Power Unit*	SEL Values (in dBA) At Varying Distances (In Feet)				
			500	*1,000*	*2,000*	*5,000*	*10,000*
Takeoff/Departure Operations (at 300 knots airspeed)

Source: SELCalc2 (Flyover Noise Calculator), Using Noisemap 6/7 and Maximum Omega10 Result as the defaults.

Because the SEL and the maximum sound level are both used to describe single events, there is sometimes confusion between the two, so the specific metric used should be clearly stated.

SEL can be computed for C-weighted levels (appropriate for impulsive sounds), and the results denoted CSEL or L_{CE}. SEL for A-weighted sound is sometimes denoted ASEL. Within this study, SEL is used for A-weighted sounds and CSEL for C-weighted.

Equivalent Sound Level

For longer periods of time, total sound is represented by the equivalent continuous sound pressure level (L_{eq}). L_{eq} is the average sound level over some time period (often an hour or a day, but any explicit time span can be specified), with the averaging being done on the same energy basis as used for SEL. SEL and L_{eq} are closely related, with L_{eq} being SEL over some time period normalized by that time.

Just as SEL has proven to be a good measure of the noise impact of a single event, L_{eq} has been established to be a good measure of the impact of a series of events during a given time period. Also, while L_{eq} is defined as an average, it is effectively a sum over that time period and is, thus, a measure of the cumulative impact of noise.

Day-Night Average Sound Level

Noise tends to be more intrusive at night than during the day. This effect is accounted for by applying a 10 dB penalty to events that occur after 10 pm and before 7 am. If L_{eq} is computed over a 24-hour period with this nighttime penalty applied, the result is the DNL. DNL is the community noise metric recommended by the USEPA (United States Environmental Protection Agency [USEPA] 1974) and has been adopted by most federal agencies (Federal Interagency Committee on Noise 1992). It has been

well established that DNL correlates well with long-term community response to noise (Schultz 1978; Finegold *et al.* 1994). This correlation is presented in Section 1.3 of this appendix.

DNL accounts for the total, or cumulative, noise impact at a given location, and for this reason is often referred to as a "cumulative" metric.

It was noted earlier that, for impulsive sounds, such as sonic booms, C-weighting is more appropriate than A-weighting. The day-night average sound level computed with C-weighting is denoted CDNL or L_{Cdn}. This procedure has been standardized, and impact interpretive criteria similar to those for DNL have been developed (Committee on Hearing, Bioacoustics and Biomechanics 1981).

ONSET-ADJUSTED MONTHLY DAY-NIGHT AVERAGE SOUND LEVEL

Aircraft operations in military training airspace generate a noise environment somewhat different from other community noise environments. Overflights are sporadic, occurring at random times and varying from day to day and week to week. This situation differs from most community noise environments, in which noise tends to be continuous or patterned. Individual military overflight events also differ from typical community noise events in that noise from a low-altitude, high-airspeed flyover can have a rather sudden onset.

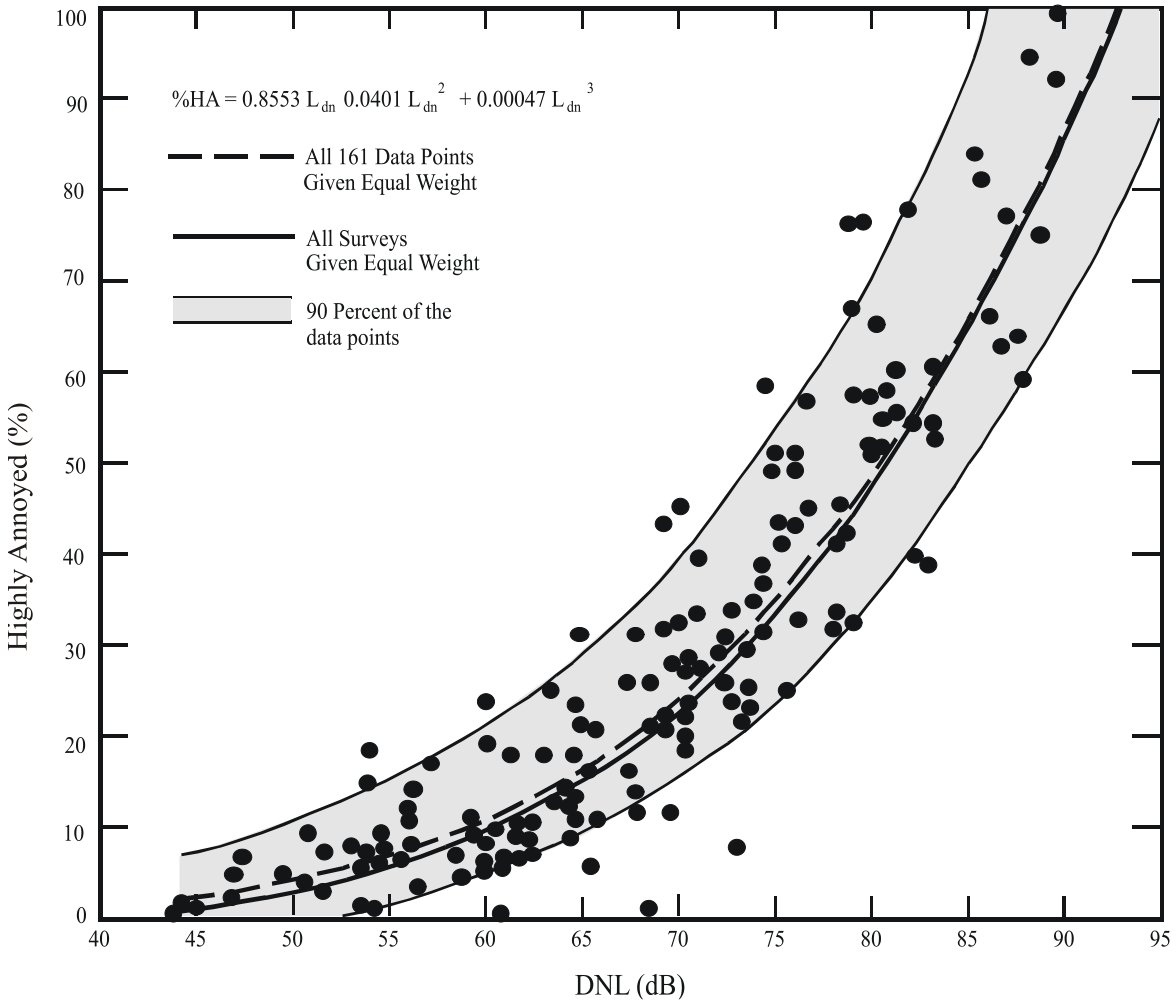
To represent these differences, the conventional DNL metric is adjusted to account for the "surprise" effect of the sudden onset of aircraft noise events on humans (Plotkin *et al.* 1987; Stusnick *et al.* 1992; Stusnick *et al.* 1993). For aircraft exhibiting a rate of increase in sound level (called onset rate) of from 15 to 150 dB per second, an adjustment or penalty ranging from 0 to 11 dB is added to the normal SEL. Onset rates above 150 dB per second require an 11 dB penalty, while onset rates below 15 dB per second require no adjustment. The DNL is then determined in the same manner as for conventional aircraft noise events and is designated as Onset-Rate Adjusted Day-Night Average Sound Level (abbreviated L_{dnmr}).

Because of the irregular occurrences of aircraft operations, the number of average daily operations is determined by using the calendar month with the highest number of operations. The monthly average is denoted L_{dnmr}. Noise levels are calculated the same way for both DNL and L_{dnmr}. L_{dnmr} is interpreted by the same criteria as used for DNL.

1.3 NOISE IMPACT

COMMUNITY REACTION

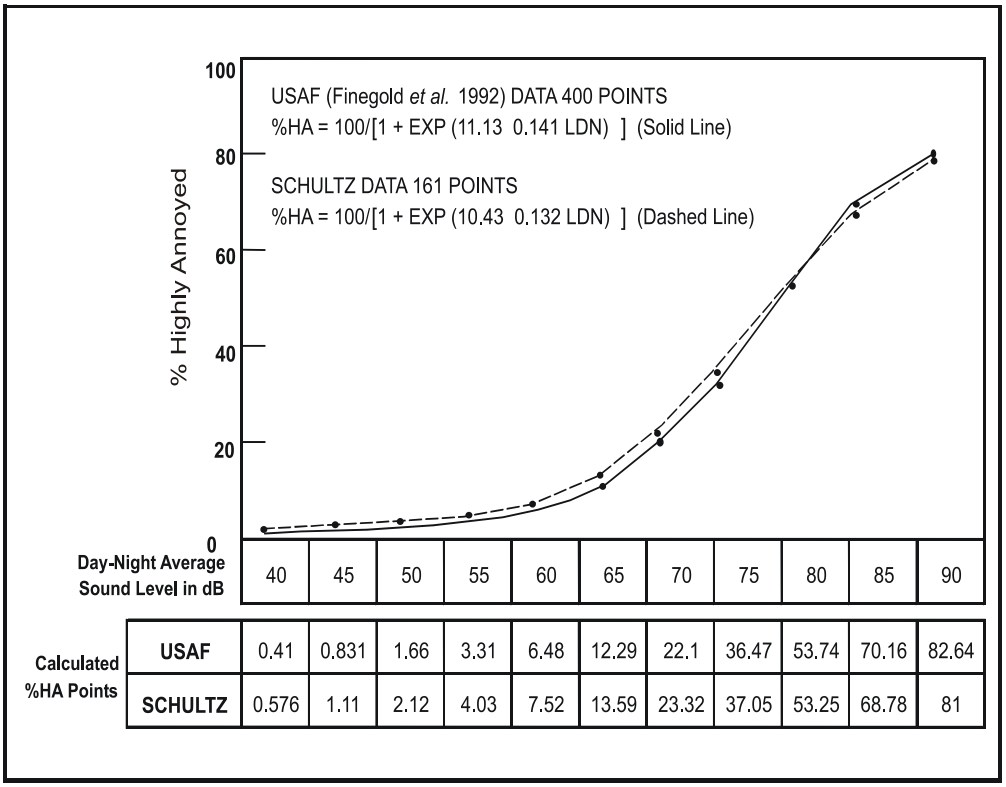
Studies of long-term community annoyance to numerous types of environmental noise show that DNL correlates well with the annoyance. Schultz (1978) showed a consistent relationship between DNL and annoyance. Shultz's original curve fit (Figure I-2) shows that there is a remarkable consistency in results of attitudinal surveys which relate the percentages of groups of people who express various degrees of annoyance when exposed to different DNL.



Source: Schultz 1978

Figure I-2. Community Surveys of Noise Annoyance

A more recent study has reaffirmed this relationship (Fidell *et al.* 1991). Figure I-3 (Federal Interagency Committee on Noise 1992) shows an updated form of the curve fit (Finegold *et al.* 1994) in comparison with the original. The updated fit, which does not differ substantially from the original, is the current preferred form. In general, correlation coefficients of 0.85 to 0.95 are found between the percentages of groups of people highly annoyed and the level of average noise exposure. The correlation coefficients for the annoyance of individuals are relatively low, however, on the order of 0.5 or less. This is not surprising, considering the varying personal factors that influence the manner in which individuals react to noise. Nevertheless, findings substantiate that community annoyance to aircraft noise is represented quite reliably using DNL.



Day-Night Average Sound Level in dB		40	45	50	55	60	65	70	75	80	85	90
Calculated %HA Points	USAF	0.41	0.831	1.66	3.31	6.48	12.29	22.1	36.47	53.74	70.16	82.64
	SCHULTZ	0.576	1.11	2.12	4.03	7.52	13.59	23.32	37.05	53.25	68.78	81

Figure I-3. Response of Communities to Noise; Comparison of Original (Schultz 1978) and Current (Finegold *et al*. 1994) Curve Fits

As noted earlier for SEL, DNL does not represent the sound level heard at any particular time, but rather represents the total sound exposure. DNL accounts for the sound level of individual noise events, the duration of those events, and the number of events. Its use is endorsed by the scientific community (American National Standards Institute 1980, 1988, 2005; USEPA 1974; Federal Interagency Committee on Urban Noise 1980; Federal Interagency Committee on Noise 1992).

While DNL is the best metric for quantitatively assessing cumulative noise impact, it does not lend itself to intuitive interpretation by non-experts. Accordingly, it is common for environmental noise analyses to include other metrics for illustrative purposes. A general indication of the noise environment can be presented by noting the maximum sound levels which can occur and the number of times per day noise events will be loud enough to be heard. Use of other metrics as supplements to DNL has been endorsed by federal agencies (Federal Interagency Committee on Noise 1992).

The Schultz curve is generally applied to annual average DNL. In Section 1.2, L_{dnmr} was described and presented as being appropriate for quantifying noise in military airspace. The Schultz curve is used with L_{dnmr} as the noise metric. L_{dnmr} is always equal to or greater than DNL, so impact is generally higher than would have been predicted if the onset rate and busiest-month adjustments were not accounted for.

There are several points of interest in the noise-annoyance relation. The first is DNL of 65 dB. This is a level most commonly used for noise planning purposes and represents a compromise between community impact and the need for activities like aviation which do cause noise. Areas exposed to DNL above 65 dB are generally not considered suitable for residential use. The second is DNL of 55 dB, which was identified by USEPA as a level "...requisite to protect the public health and welfare with an adequate margin of safety," (USEPA 1974) which is essentially a level below which adverse impact is not expected. The third is DNL of 75 dB. This is the lowest level at which adverse health effects could be credible

(USEPA 1974). The very high annoyance levels correlated with DNL of 75 dB make such areas unsuitable for residential land use.

Sonic boom exposure is measured by C-weighting, with the corresponding cumulative metric being CDNL. Correlation between CDNL and annoyance has been established, based on community reaction to impulsive sounds (Committee on Hearing, Bioacoustics and Biomechanics 1981). Values of the C-weighted equivalent to the Schultz curve are different than that of the Schultz curve itself. Table I-3 shows the relation between annoyance, DNL, and CDNL.

Table I-3. Relation Between Annoyance, DNL and CDNL

DNL	*% Highly Annoyed*	*CDNL*
45	0.83	42
50	1.66	46
55	3.31	51
60	6.48	56
65	12.29	60
70	22.10	65

Interpretation of CDNL from impulsive noise is accomplished by using the CDNL versus annoyance values in Table I-3. CDNL can be interpreted in terms of an "equivalent annoyance" DNL. For example, CDNL of 52, 61, and 69 dB are equivalent to DNL of 55, 65, and 75 dB, respectively. If both continuous and impulsive noise occurs in the same area, impacts are assessed separately for each.

LAND USE COMPATIBILITY

As noted above, the inherent variability between individuals makes it impossible to predict accurately how any individual will react to a given noise event. Nevertheless, when a community is considered as a whole, its overall reaction to noise can be represented with a high degree of confidence. As described above, the best noise exposure metric for this correlation is the DNL or L_{dnmr} for military overflights. Impulsive noise can be assessed by relating CDNL to an "equivalent annoyance" DNL, as outlined in Section 1.3.1.

In June 1980, an ad hoc Federal Interagency Committee on Urban Noise published guidelines (Federal Interagency Committee on Urban Noise 1980) relating DNL to compatible land uses. This committee was composed of representatives from DoD, Transportation, and Housing and Urban Development; USEPA; and the Veterans Administration. Since the issuance of these guidelines, federal agencies have generally adopted these guidelines for their noise analyses.

Following the lead of the committee, DoD and FAA adopted the concept of land-use compatibility as the accepted measure of aircraft noise effect. The FAA included the committee's guidelines in the Federal Aviation Regulations (United States Department of Transportation 1984). These guidelines are reprinted in Table I-4, along with the explanatory notes included in the regulation. Although these guidelines are not mandatory (note the footnote "*" in the table), they provide the best means for determining noise impact in airport communities. In general, residential land uses normally are not compatible with outdoor DNL values above 65 dB, and the extent of land areas and populations exposed to DNL of 65 dB and higher provides the best means for assessing the noise impacts of alternative aircraft actions. In some cases a change in noise level, rather than an absolute threshold, may be a more appropriate measure of impact. The FAA recognizes that there are settings where the 65 dB DNL standard may not apply. Special consideration needs to be given to the evaluation of the significance of noise impacts on noise sensitive areas within national parks, national wildlife refuges and historic sites, including traditional cultural properties.

Table I-4. Land-Use Compatibility With Yearly Day-Night Average Sound Levels

	Yearly Day-Night Average Sound Level (DNL) in Decibels

* The designations contained in this table do not constitute a federal determination that any use of land covered by the program is acceptable or unacceptable under federal, state, or local law. The responsibility for determining the acceptable and permissible land uses and the relationship between specific properties and specific noise contours rests with the local authorities. FAA determinations under Part 150 are not intended to substitute federally determined land uses for those determined to be appropriate by local authorities in response to locally determined needs and values in achieving noise-compatible land uses.

Key:

Y (YES) = Land Use and related structures compatible without restrictions.

N (No) = Land Use and related structures are not compatible and should be prohibited.

NLR = Noise Level Reduction (outdoor to indoor) to be achieved through incorporation of noise attenuation into the design and construction of the structure.

25, 30, or 35 = Land Use and related structures generally compatible; measures to achieve NLR of 25, 30, or 35 dB must be incorporated into design and construction of structures.

Notes:

1. Where the community determines that residential or school uses must be allowed, measures to achieve outdoor-to-indoor NLR of at least 25 dB and 30 dB should be incorporated into building codes and be considered in individual approvals. Normal residential construction can be expected to provide an NLR of 20 dB; thus the reduction requirements are often stated as 5, 10, or 15 dB over standard construction and normally assume mechanical ventilation and closed windows year-round. However, the use of NLR criteria will not eliminate outdoor noise problems.
2. Measures to achieve NLR 25 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise-sensitive areas, or where the normal noise level is low.
3. Measures to achieve NLR 30 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise-sensitive areas, or where the normal noise level is low.
4. Measures to achieve NLR 35 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise-sensitive areas, or where the normal noise level is low.
5. Land-use compatible provided special sound reinforcement systems are installed.
6. Residential buildings require an NLR of 25.
7. Residential buildings require an NLR of 30.
8. Residential buildings not permitted.

2.0 NOISE EFFECTS

The discussion in Section 1.3 presents the global effect of noise on communities. The following sections describe particular noise effects.

2.1 HEARING LOSS

Noise-induced hearing loss is probably the best defined of the potential effects of human exposure to excessive noise. Federal workplace standards for protection from hearing loss allow a time-average level of 90 dB over an 8-hour work period, or 85 dB averaged over a 16-hour period. Even the most protective criterion (no measurable hearing loss for the most sensitive portion of the population at the ear's most sensitive frequency, 4,000 Hz, after a 40-year exposure suggests a time-average sound level of 70 dB over a 24-hour period (USEPA 1974). Since it is unlikely that airport neighbors will remain outside their homes 24 hours per day for extended periods of time, there is little possibility of hearing loss below a DNL of 75 dB, and this level is extremely conservative.

2.2 NONAUDITORY HEALTH EFFECTS

Nonauditory health effects of long-term noise exposure, where noise may act as a risk factor, have not been found to occur at levels below those protective against noise-induced hearing loss, described above. Most studies attempting to clarify such health effects have found that noise exposure levels established for hearing protection will also protect against any potential nonauditory health effects, at least in workplace conditions. The best scientific summary of these findings is contained in the lead paper at the National Institutes of Health Conference on Noise and Hearing Loss, held on January 22–24, 1990, in Washington, D.C., which states "The nonauditory effects of chronic noise exposure, when noise is suspected to act as one of the risk factors in the development of hypertension, cardiovascular disease, and other nervous disorders, have never been proven to occur as chronic manifestations at levels below these criteria (an average of 75 dBA for complete protection against hearing loss for an eight-hour day)" (von Gierke 1990; parenthetical wording added for clarification). At the International Congress (1988) on Noise as a Public Health Problem, most studies attempting to clarify such health effects did not find them at levels below the criteria protective of noise-induced hearing loss; and even above these criteria, results regarding such health effects were ambiguous.

Consequently, it can be concluded that establishing and enforcing exposure levels protecting against noise-induced hearing loss would not only solve the noise-induced hearing loss problem but also any potential nonauditory health effects in the work place.

Although these findings were directed specifically at noise effects in the work place, they are equally applicable to aircraft noise effects in the community environment. Research studies regarding the nonauditory health effects of aircraft noise are ambiguous, at best, and often contradictory. Yet, even those studies which purport to find such health effects use time-average noise levels of 75 dB and higher for their research.

For example, in an often-quoted paper, two University of California at Los Angeles researchers found a relation between aircraft noise levels under the approach path to Los Angeles International Airport and increased mortality rates among the exposed residents by using an average noise exposure level greater than 75 dB for the "noise-exposed" population (Meecham and Shaw 1979). Nevertheless, three other University of California at Los Angeles professors analyzed those same data and found no relation between noise exposure and mortality rates (Frerichs *et al*. 1980).

As a second example, two other University of California at Los Angeles researchers used this same population near Los Angeles International Airport to show a higher rate of birth defects during the period of 1970 to 1972 when compared with a control group residing away from the airport (Jones and Tauscher 1978). Based on this report, a separate group at the United States Centers for Disease Control performed a more thorough study of populations near Atlanta's Hartsfield International Airport for 1970 to 1972 and found no relation in their study of 17 identified categories of birth defects to aircraft noise levels above 65 dB (Edmonds *et al.* 1979).

A recent review of health effects, prepared by a Committee of the Health Council of The Netherlands (Committee of the Health Council of the Netherlands 1996), analyzed currently available published information on this topic. The committee concluded that the threshold for possible long-term health effects was a 16-hour (6:00 a.m. to 10:00 p.m.) L_{eq} of 70 dB. Projecting this to 24 hours and applying the 10 dB nighttime penalty used with DNL, this corresponds to DNL of about 75 dB. The study also affirmed the risk threshold for hearing loss, as discussed earlier.

In summary, there is no scientific basis for a claim that potential health effects exist for aircraft time-average sound levels below 75 dB. The potential for noise to affect physiological health, such as the cardiovascular system, has been speculated; however, no unequivocal evidence exists to support such claims (Harris 1997). Conclusions drawn from a review of health effect studies involving military low-altitude flight noise with its unusually high maximum levels and rapid rise in sound level have shown no increase in cardiovascular disease (Schwarze and Thompson 1993). Additional claims that are unsupported include flyover noise producing increased mortality rates and increases in cardiovascular death, aggravation of post-traumatic stress disorder, increased stress, increases in admissions to mental hospitals, and adverse affects on pregnant women and the unborn fetus (Harris 1997).

2.3 ANNOYANCE

The primary effect of aircraft noise on exposed communities is one of annoyance. Noise annoyance is defined by the USEPA as any negative subjective reaction on the part of an individual or group (USEPA 1974). As noted in the discussion of DNL above, community annoyance is best measured by that metric.

Because the USEPA Levels Document (USEPA 1974) identified DNL of 55 dB as ". . . requisite to protect public health and welfare with an adequate margin of safety," it is commonly assumed that 55 dB should be adopted as a criterion for community noise analysis. From a noise exposure perspective, that would be an ideal selection. However, financial and technical resources are generally not available to achieve that goal. Most agencies have identified DNL of 65 dB as a criterion which protects those most impacted by noise, and which can often be achieved on a practical basis (Federal Interagency Committee on Noise 1992). This corresponds to about 12 percent of the exposed population being highly annoyed.

Although DNL of 65 dB is widely used as a benchmark for significant noise impact, and is often an acceptable compromise, it is not a statutory limit, and it is appropriate to consider other thresholds in particular cases.

In this analysis, no specific threshold is used. The noise in the affected environment is evaluated on the basis of the information presented in this appendix and in the body of the environmental analysis.

Community annoyance from sonic booms is based on CDNL, as discussed in Section 1.3. These effects are implicitly included in the "equivalent annoyance" CDNL values in Table I-3, since those were developed from actual community noise impact.

2.4 SPEECH INTERFERENCE

Speech interference associated with aircraft noise is a primary cause of annoyance to individuals on the ground. The disruption of routine activities in the home, such as radio or television listening, telephone use, or family conversation, gives rise to frustration and irritation. The quality of speech communication is also important in classrooms, offices, and industrial settings and can cause fatigue and vocal strain in those who attempt to communicate over the noise. Research has shown that the use of the SEL metric will measure speech interference successfully, and that a SEL exceeding 65 dB will begin to interfere with speech communication.

2.5 SLEEP INTERFERENCE

Sleep interference is another source of annoyance associated with aircraft noise. This is especially true because of the intermittent nature and content of aircraft noise, which is more disturbing than continuous noise of equal energy and neutral meaning.

Sleep interference may be measured in either of two ways. "Arousal" represents actual awakening from sleep, while a change in "sleep stage" represents a shift from one of four sleep stages to another stage of lighter sleep without actual awakening. In general, arousal requires a somewhat higher noise level than does a change in sleep stage.

An analysis sponsored by the Air Force summarized 21 published studies concerning the effects of noise on sleep (Pearsons *et al*. 1989). The analysis concluded that a lack of reliable in-home studies, combined with large differences among the results from the various laboratory studies, did not permit development of an acceptably accurate assessment procedure. The noise events used in the laboratory studies and in contrived in-home studies were presented at much higher rates of occurrence than would normally be experienced. None of the laboratory studies were of sufficiently long duration to determine any effects of habituation, such as that which would occur under normal community conditions. A recent extensive study of sleep interference in people's own homes (Ollerhead *et al.* 1992) showed very little disturbance from aircraft noise.

There is some controversy associated with the recent studies, so a conservative approach should be taken in judging sleep interference. Based on older data, the USEPA identified an indoor DNL of 45 dB as necessary to protect against sleep interference (USEPA 1974). Assuming a very conservative structural noise insulation of 20 dB for typical dwelling units, this corresponds to an outdoor DNL of 65 dB as minimizing sleep interference.

A 1984 publication reviewed the probability of arousal or behavioral awakening in terms of SEL (Kryter 1984). Figure I-4, extracted from Figure 10.37 of Kryter (1984), indicates that an indoor SEL of 65 dB or lower should awaken less than 5 percent of those exposed. These results do not include any habituation over time by sleeping subjects. Nevertheless, this provides a reasonable guideline for assessing sleep interference and corresponds to similar guidance for speech interference, as noted above.

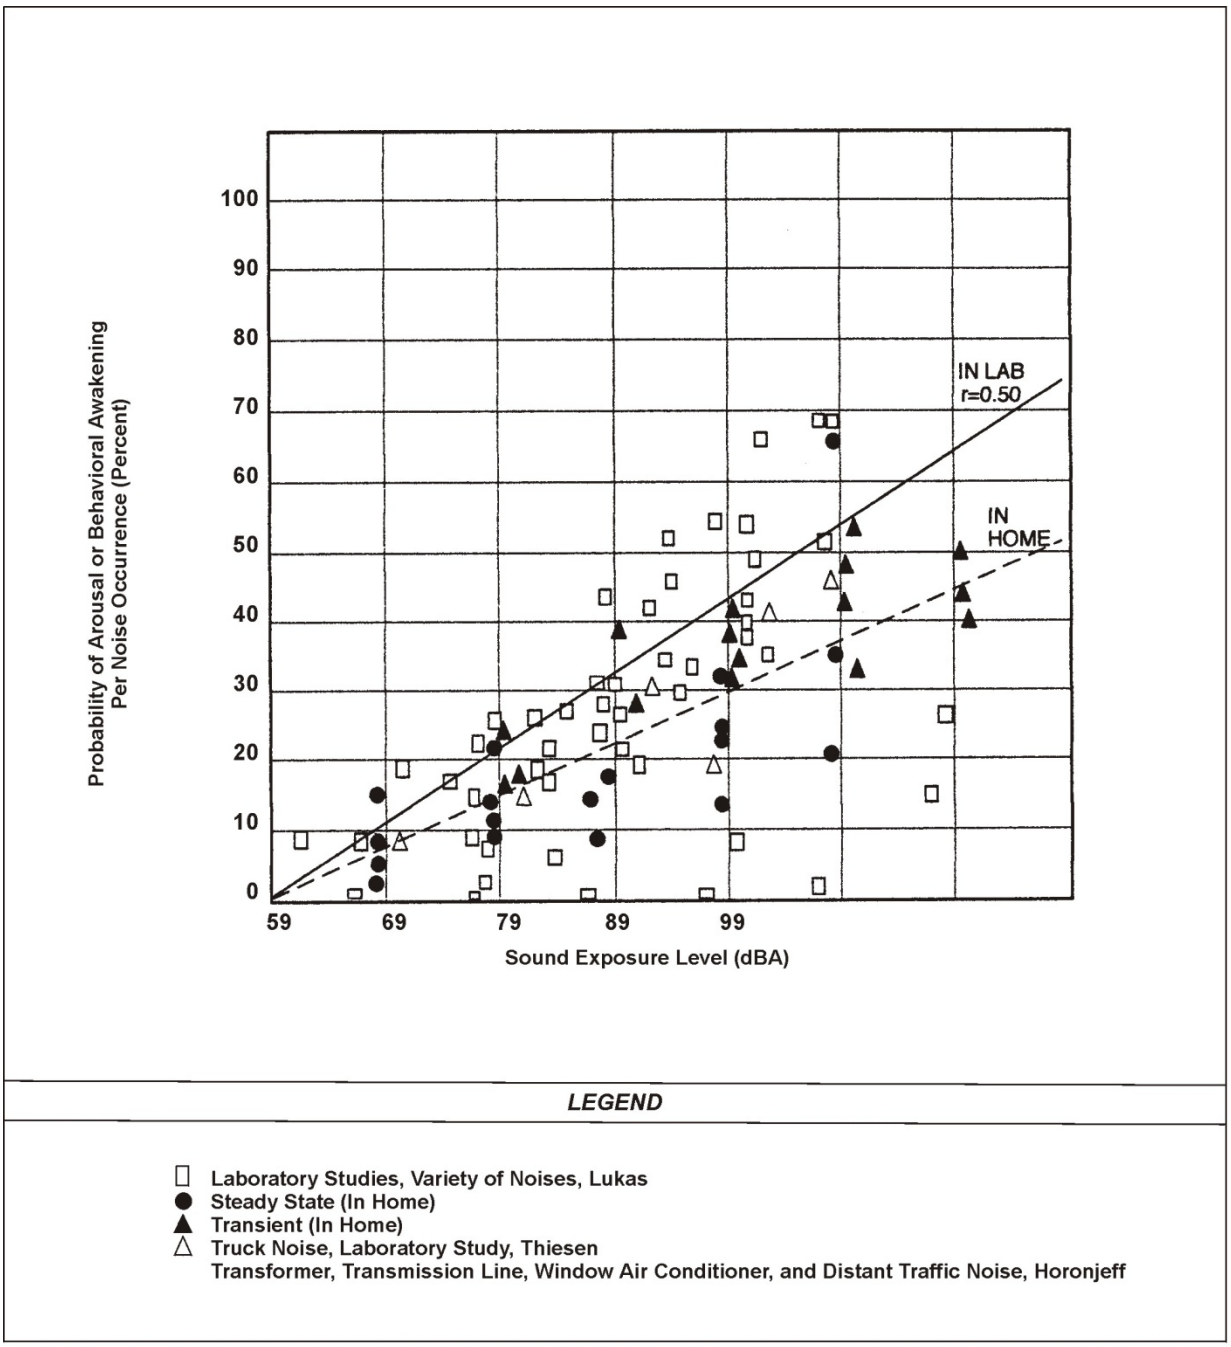

Figure I-4. Probability of Arousal or Behavioral Awakening in Terms of Sound Exposure Level

2.6 NOISE EFFECTS ON DOMESTIC ANIMALS AND WILDLIFE

Animal species differ greatly in their responses to noise. Each species has adapted, physically and behaviorally, to fill its ecological role in nature, and its hearing ability usually reflects that role. Animals rely on their hearing to avoid predators, obtain food, and communicate with and attract other members of their species. Aircraft noise may mask or interfere with these functions. Secondary effects may include nonauditory effects similar to those exhibited by humans: stress, hypertension, and other nervous disorders. Tertiary effects may include interference with mating and resultant population declines.

2.7 NOISE EFFECTS ON STRUCTURES

SUBSONIC AIRCRAFT NOISE

Normally, the most sensitive components of a structure to airborne noise are the windows and, infrequently, the plastered walls and ceilings. An evaluation of the peak sound pressures impinging on the structure is normally sufficient to determine the possibility of damage. In general, at sound levels above 130 dB, there is the possibility of the excitation of structural component resonance. While certain frequencies (such as 30 Hz for window breakage) may be of more concern than other frequencies, conservatively, only sounds lasting more than one second above a sound level of 130 dB are potentially damaging to structural components (National Research Council/National Academy of Sciences 1977).

A study directed specifically at low-altitude, high-speed aircraft showed that there is little probability of structural damage from such operations (Sutherland 1989). One finding in that study is that sound levels at damaging frequencies (e.g., 30 Hz for window breakage or 15 to 25 Hz for whole-house response) are rarely above 130 dB.

Noise-induced structural vibration may also cause annoyance to dwelling occupants because of induced secondary vibrations, or "rattle," of objects within the dwelling, such as hanging pictures, dishes, plaques, and bric-a-brac. Window panes may also vibrate noticeably when exposed to high levels of airborne noise, causing homeowners to fear breakage. In general, such noise-induced vibrations occur at sound levels above those considered normally incompatible with residential land use. Thus assessments of noise exposure levels for compatible land use should also be protective of noise-induced secondary vibrations.

SONIC BOOMS

Sonic booms are commonly associated with structural damage. Most damage claims are for brittle objects, such as glass and plaster. Table I-5 summarizes the threshold of damage that might be expected at various overpressures. There is a large degree of variability in damage experience, and much damage depends on the pre-existing condition of a structure. Breakage data for glass, for example, spans a range of two to three orders of magnitude at a given overpressure. At 1 psf, the probability of a window breaking ranges from one in a billion (Sutherland 1990) to one in a million (Hershey and Higgins 1976). These damage rates are associated with a combination of boom load and glass condition. At 10 psf, the probability of breakage is between one in a hundred and one in a thousand. Laboratory tests of glass (White 1972) have shown that properly installed window glass will not break at overpressures below 10 psf, even when subjected to repeated booms, but in the real world glass is not in pristine condition.

Table I-5. Possible Damage to Structures From Sonic Booms

Sonic Boom Overpressure Nominal (psf)	*Type of Damage*	*Item Affected*
0.5 - 2	Plaster	Fine cracks; extension of existing cracks; more in ceilings; over door frames; between some plaster boards.
	Glass	Rarely shattered; either partial or extension of existing.
	Roof	Slippage of existing loose tiles/slates; sometimes new cracking of old slates at nail hole.
	Damage to outside walls	Existing cracks in stucco extended.
	Bric-a-brac	Those carefully balanced or on edges can fall; fine glass, such as large goblets, can fall and break.
	Other	Dust falls in chimneys.
2 - 4	Glass, plaster, roofs, ceilings	Failures show that would have been difficult to forecast in terms of their existing localized condition. Nominally in good condition.
4 - 10	Glass	Regular failures within a population of well-installed glass; industrial as well as domestic greenhouses.
	Plaster	Partial ceiling collapse of good plaster; complete collapse of very new, incompletely cured, or very old plaster.
	Roofs	High probability rate of failure in nominally good state, slurry-wash; some chance of failures in tiles on modern roofs; light roofs (bungalow) or large area can move bodily.
	Walls (out)	Old, free standing, in fairly good condition can collapse.
	Walls (in)	Inside ("party") walls known to move at 10 psf.
Greater than 10	Glass	Some good glass will fail regularly to sonic booms from the same direction. Glass with existing faults could shatter and fly. Large window frames move.
	Plaster	Most plaster affected.
	Ceilings	Plaster boards displaced by nail popping.
	Roofs	Most slate/slurry roofs affected, some badly; large roofs having good tile can be affected; some roofs bodily displaced causing gale-end and will-plate cracks; domestic chimneys dislodged if not in good condition.
	Walls	Internal party walls can move even if carrying fittings such as hand basins or taps; secondary damage due to water leakage.
	Bric-a-brac	Some nominally secure items can fall; e.g., large pictures, especially if fixed to party walls.

Source: Haber and Nakaki 1989

Damage to plaster occurs at similar ranges to glass damage. Plaster has a compounding issue in that it will often crack due to shrinkage while curing, or from stresses as a structure settles, even in the absence of outside loads. Sonic boom damage to plaster often occurs when internal stresses are high from these factors.

Some degree of damage to glass and plaster should thus be expected whenever there are sonic booms, but usually at the low rates noted above. In general, structural damage from sonic booms should be expected only for overpressures above 10 psf.

2.8 NOISE EFFECTS ON TERRAIN

SUBSONIC AIRCRAFT NOISE

Members of the public often believe that noise from low-flying aircraft can cause avalanches or landslides by disturbing fragile soil or snow structures in mountainous areas. There are no known instances of such effects, and it is considered improbable that such effects will result from routine, subsonic aircraft operations**.**

SONIC BOOMS

In contrast to subsonic noise, sonic booms are considered to be a potential trigger for snow avalanches. Avalanches are highly dependent on the physical status of the snow, and do occur spontaneously. They can be triggered by minor disturbances, and there are documented accounts of sonic booms triggering avalanches. Switzerland routinely restricts supersonic flight during avalanche season.

Landslides are not an issue for sonic booms. There was one anecdotal report of a minor landslide from a sonic boom generated by the Space Shuttle during landing, but there is no credible mechanism or consistent pattern of reports.

2.9 NOISE EFFECTS ON HISTORICAL AND ARCHAEOLOGICAL SITES

Because of the potential for increased fragility of structural components of historical buildings and other historical sites, aircraft noise may affect such sites more severely than newer, modern structures. Again, there are few scientific studies of such effects to provide guidance for their assessment.

One study involved the measurements of sound levels and structural vibration levels in a superbly restored plantation house, originally built in 1795, and now situated approximately 1,500 feet from the centerline at the departure end of Runway 19L at Washington Dulles International Airport. These measurements were made in connection with the proposed scheduled operation of the supersonic Concorde airplane at Dulles (Wesler 1977). There was special concern for the building's windows, since roughly half of the 324 panes were original. No instances of structural damage were found. Interestingly, despite the high levels of noise during Concorde takeoffs, the induced structural vibration levels were actually less than those induced by touring groups and vacuum cleaning within the building itself.

As noted above for the noise effects of noise-induced vibrations on normal structures, assessments of noise exposure levels for normally compatible land uses should also be protective of historic and archaeological sites.

3.0 NOISE MODELING

3.1 SUBSONIC AIRCRAFT NOISE

An aircraft in subsonic flight generally emits noise from two sources: the engines and flow noise around the airframe. Noise generation mechanisms are complex and, in practical models, the noise sources must be based on measured data. The Air Force has developed a series of computer models and aircraft noise databases for this purpose. The models include NOISEMAP (Moulton 1992) for noise around airbases, and MR_NMAP (Lucas and Calamia 1996) for use in MOAs, ranges, and low-level training routes. These models use the NOISEFILE database developed by the Air Force. NOISEFILE data includes SEL and L_{Amax} as a function of speed and power setting for aircraft in straight flight.

Noise from an individual aircraft is a time-varying continuous sound. It is first audible as the aircraft approaches, increases to a maximum when the aircraft is near its closest point, then diminishes as it departs. The noise depends on the speed and power setting of the aircraft and its trajectory. The models noted above divide the trajectory into segments whose noise can be computed from the data in NOISEFILE. The contributions from these segments are summed.

MR_NMAP was used to compute noise levels in the airspace. The primary noise metric computed by MR_NMAP was L_{dnmr} averaged over each airspace. Supporting routines from NOISEMAP were used to calculate SEL and L_{Amax} for various flight altitudes and lateral offsets from a ground receiver position.

3.2 SONIC BOOMS

When an aircraft moves through the air, it pushes the air out of its way. At subsonic speeds, the displaced air forms a pressure wave that disperses rapidly. At supersonic speeds, the aircraft is moving too quickly for the wave to disperse, so it remains as a coherent wave. This wave is a sonic boom. When heard at the ground, a sonic boom consists of two shock waves (one associated with the forward part of the aircraft, the other with the rear part) of approximately equal strength and (for fighter aircraft) separated by 100 to 200 milliseconds. When plotted, this pair of shock waves and the expanding flow between them have the appearance of a capital letter “N,” so a sonic boom pressure wave is usually called an “N-wave.” An N-wave has a characteristic "bang-bang" sound that can be startling. Figure I-5 shows the generation and evolution of a sonic boom N-wave under the aircraft. Figure I-6 shows the sonic boom pattern for an aircraft in steady supersonic flight. The boom forms a cone that is said to sweep out a “carpet” under the flight track.

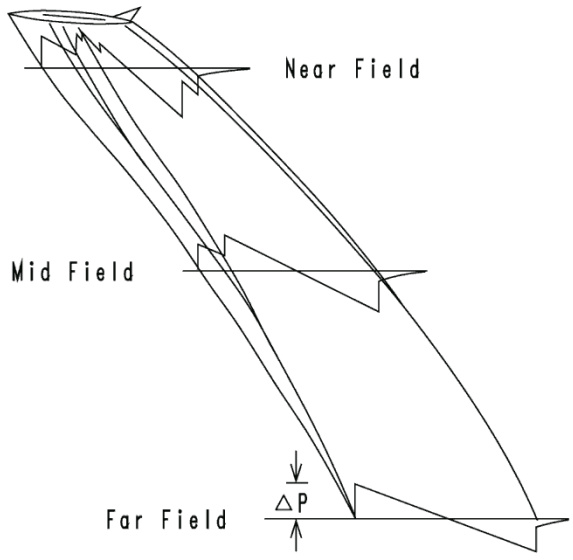

Figure I-5. Sonic Boom Generation and Evolution to N-Wave

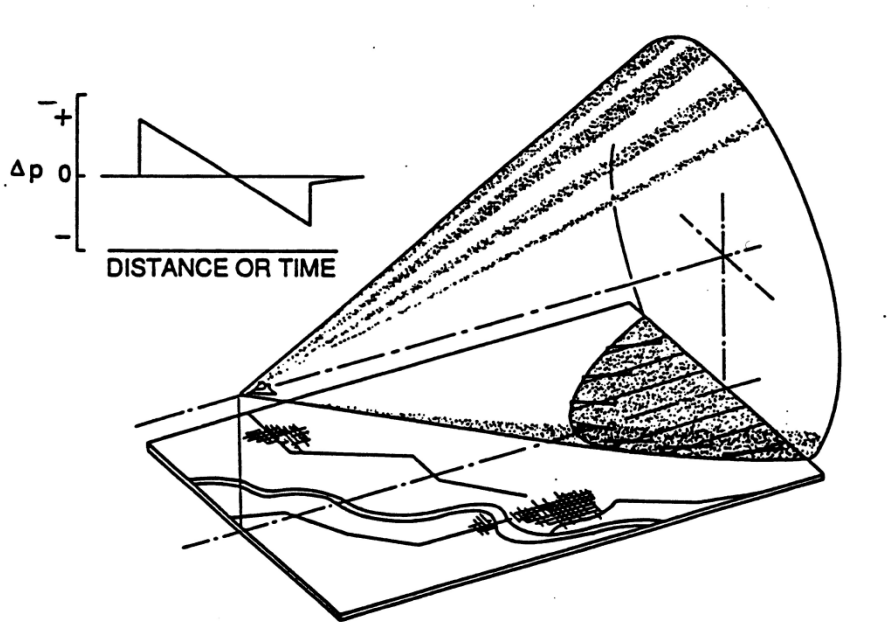

Figure I-6. Sonic Boom Carpet in Steady Flight

The complete ground pattern of a sonic boom depends on the size, shape, speed, and trajectory of the aircraft. Even for a nominally steady mission, the aircraft must accelerate to supersonic speed at the start, decelerate back to subsonic speed at the end, and usually change altitude. Figure I-7 illustrates the complexity of a nominal full mission.

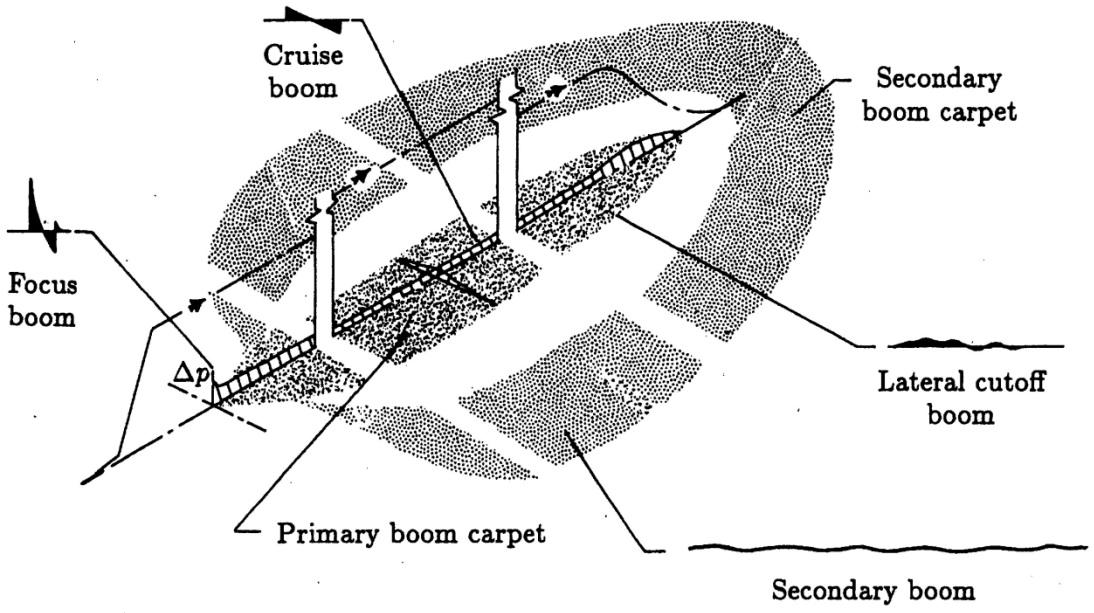

Figure I-7. Complex Sonic Boom Pattern for Full Mission

The Air Force's PCBoom4 computer program (Plotkin and Grandi 2002) can be used to compute the complete sonic boom footprint for a given single event, accounting for details of a particular maneuver.

Supersonic operations for the proposed action and alternatives are, however, associated with air combat training, which cannot be described in the deterministic manner that PCBoom4 requires. Supersonic events occur as aircraft approach an engagement, break at the end, and maneuver for advantage during the engagement. Long time cumulative sonic boom exposure, CDNL, is meaningful for this kind of environment.

Long-term sonic boom measurement projects have been conducted in four supersonic air combat training airspaces: White Sands, New Mexico (Plotkin *et al.* 1989); the eastern portion of the Goldwater Range, Arizona (Plotkin *et al.* 1992); the Elgin MOA at Nellis AFB, Nevada (Frampton *et al.* 1993); and the western portion of the Goldwater Range (Page *et al.* 1994). These studies included analysis of schedule and air combat maneuvering instrumentation data and supported development of the 1992 BOOMAP model (Plotkin *et al.* 1992). The current version of BOOMAP (Frampton *et al.* 1993; Plotkin 1996) incorporates results from all four studies. Because BOOMAP is directly based on long-term measurements, it implicitly accounts for such variables as maneuvers, statistical variations in operations, atmosphere effects, and other factors.

Figure I-8 shows a sample of supersonic flight tracks measured in the air combat training airspace at White Sands (Plotkin *et al.* 1989). The tracks fall into an elliptical pattern aligned with preferred engagement directions in the airspace. Figure I-9 shows the CDNL contours that were fit to six months of measured booms in that airspace. The subsequent measurement programs refined the fit, and demonstrated that the elliptical maneuver area is related to the size and shape of the airspace (Frampton *et al*. 1993). BOOMAP quantifies the size and shape of CDNL contours, and also numbers of booms per day, in air combat training airspaces. That model was used for prediction of cumulative sonic boom exposure in this analysis.

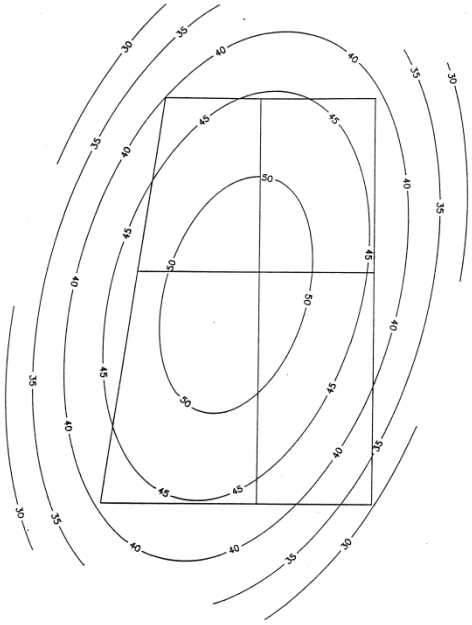

Figure I-9. Elliptical CDNL Contours in Supersonic Air Combat Training Airspace

4.0 DETAILED NOISE ANALYSIS RESULTS

Table I-6 expands on Table 4.2-5 in the body of the document. The frequency of events exceeding stated thresholds under baseline conditions is compared to the frequency of events under the proposed Modified Alternative A. In addition, a 95 dB threshold is included to show the frequency of overflights at higher noise levels.

Table I-7 compares the number of days between noise events under baseline conditions and under the proposed Modified Alternative A. Under the proposed Modified Alternative A, overflights of 65 dB SEL would occur as frequently as every other day, to once every 19 days. Overflights of 105 dB SEL would occur rarely under the proposed Modified Alternative A.

Table I-8 expands on Table 4.2-7 in the Chapter 4 of the document. The frequency of events under baseline conditions is compared to the frequency of events under the proposed Modified Alternative A using the Maximum Sound Level (L_{max}) noise metric. The L_{max} noise metric is used to further clarify effects of noise on different types of community annoyance.

Table I-9 compares the number of days between noise events under baseline conditions and under the proposed Modified Alternative A using the L_{max} noise metric.

1. Overflight occurrences described as rare may happen less frequently than once every 100,000 days.
2. In using MRNMAP2 to calculate time-average sound levels for airspaces, the reliability of the results varies at lower levels (below 55 dB). This arises from the increasing variability of individual aircraft sound levels at the longer distances due to atmospheric effects on sound propagation and to the presence of other sources of noise. Also, when flight activity is infrequent, the time-averaged sound levels are generated by only a few individual aircraft noise events, which may not be statistically representative of the given aircraft modeled. These infrequent operations modeled in MRNMAP2 may result in frequency anomalies at some noise level thresholds.

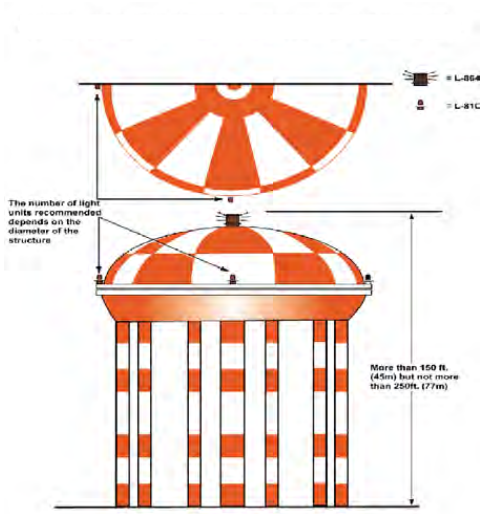
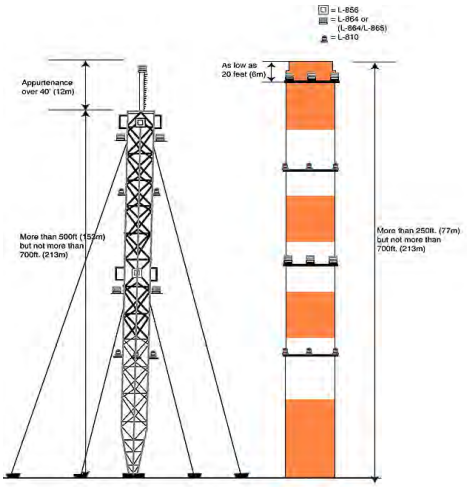
of Transportation
Federal Aviation
Administration

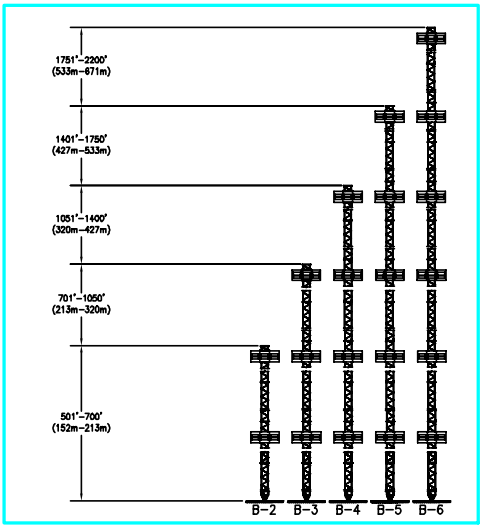
ADVISORY CIRCULAR

AC 70/7460-1K

Obstruction Marking and Lighting







Effective: 2/1/07 **Initiated by: System Operations Services**

Subject: CHANGE 2 TO OBSTRUCTION MARKING AND LIGHTING **Date:** 2/1/07 **Initiated by:** AJR-33 **AC No.:** 70/7460-1K **Change:** 2

1. PURPOSE. This change amends the Federal Aviation Administration's standards for marking and lighting structures to promote aviation safety. The change number and date of the change material are located at the top of the page.

2. EFFECTIVE DATE. This change is effective February 1, 2007.

3. EXPLANATION OF CHANGES.

   a. Table of Contents. Change pages i through iii.

   b. Page 1. Paragraph 1. **Reporting Requirements**. Incorporated the word "Title" in reference to the 14 Code of Federal Regulations (14 CFR part 77). FAA Regional Air Traffic Division office to read Obstruction Evaluation service (OES). FAA website to read http://oeaaa.faa.gov.

   c. Page 1. Paragraph 4. **Supplemental Notice Requirement** (subpart b). FAA Regional Air Traffic Division office to read OES.

   d. Page 1. Paragraph 5. **Modifications and Deviations** (subpart a). FAA Regional Air Traffic Division office to read OES.

   e. Page 1. Paragraph 5. **Modifications and Deviations** (subpart c). FAA Regional office to read OES.

   f. Page 2. Paragraph 5. **Modifications and Deviations** (subpart d). Removed period to create one sentence.

   g. Page 2. Paragraph 7. **Metric Units**. And to read however.

   h. Page 3. Paragraph 23. **Light Failure Notification** (subpart b). Nearest to read appropriate. FAA's website to read web. Website www.faa.gov/ats/ata/ata400 to read http://www.afss.com.

   i. Page 4. Paragraph 24. **Notification of Restoration**. Removed AFSS.

   j. Page 5. Paragraph 32. **Paint Standards**. Removed a comma after "Since".

   k. Page 5. Paragraph 33. **Paint Patterns** (subpart d. **Alternate Bands**). Removed number 6. Number 7 to read number 6.

   l. Page 9. Paragraph 41. **Standards**. TASC to read OTS. SVC-121.23 to read M-30.

m. Page 14. Paragraph 55. **Wind Turbine Structures**. Removed. The paragraph numbers that follow have been changed accordingly.

n. Page 18. Paragraph 65. **Wind Turbine Structures**. Removed. The paragraph numbers that follow have been changed accordingly.

o. Page 20. Paragraph 77. **Radio and Television Towers and Similar Skeletal Structures**. Excluding to read including.

p. Page 23. Paragraph 85. **Wind Turbine Structures**. Removed. The paragraph number that follows has been changed accordingly.

q. Page 33-34. Chapter 13. **Marking and Lighting Wind Turbine Farms**. Added.

CHAPTER 1. ADMINISTRATIVE AND GENERAL PROCEDURES

1. REPORTING REQUIREMENTS

A sponsor proposing any type of construction or alteration of a structure that may affect the National Airspace System (NAS) is required under the provisions of Title 14 Code of Federal Regulations (14 CFR part 77) to notify the FAA by completing the Notice of Proposed Construction or Alteration form (FAA Form 7460-1). The form should be sent to the Obstruction Evaluation service (OES). Copies of FAA Form 7460-1 may be obtained from OES, Airports District Office or FAA Website at http://oeaaa.faa.gov.

2. PRECONSTRUCTION NOTICE

The notice must be submitted:

a. At least 30 days prior to the date of proposed construction or alteration is to begin.

b. On or before the date an application for a construction permit is filed with the Federal Communications Commission (FCC). (The FCC advises its applicants to file with the FAA well in advance of the 30-day period in order to expedite FCC processing.)

3. FAA ACKNOWLEDGEMENT

The FAA will acknowledge, in writing, receipt of each FAA Form 7460-1 notice received.

4. SUPPLEMENTAL NOTICE REQUIREMENT

a. If required, the FAA will include a FAA Form 7460-2, Notice of Actual Construction or Alteration, with a determination.

b. FAA Form 7460-2 Part 1 is to be completed and sent to the FAA at least 48 hours prior to starting the actual construction or alteration of a structure. Additionally, Part 2 shall be submitted no later than 5 days after the structure has reached its greatest height. The form should be sent to the OES.

c. In addition, supplemental notice shall be submitted upon abandonment of construction.

d. Letters are acceptable in cases where the construction/alteration is temporary or a proposal is abandoned. This notification process is designed to permit the FAA the necessary time to change affected procedures and/or minimum flight altitudes, and to otherwise alert airmen of the structure's presence.

Note-
NOTIFICATION AS REQUIRED IN THE DETERMINATION IS CRITICAL TO AVIATION SAFETY.

5. MODIFICATIONS AND DEVIATIONS

a. Requests for modification or deviation from the standards outlined in this AC must be submitted to the OES. The sponsor is responsible for adhering to approved marking and/or lighting limitations, and/or recommendations given, and should notify the FAA and FCC (for those structures regulated by the FCC) prior to removal of marking and/or lighting. A request received after a determination is issued may require a new study and could result in a new determination.

b. ***Modifications***. Modifications will be based on whether or not they impact aviation safety. Examples of modifications that may be considered:

1. ***Marking and/or Lighting Only a Portion of an Object.*** The object may be so located with respect to other objects or terrain that only a portion of it needs to be marked or lighted.

2. ***No Marking and/or Lighting***. The object may be so located with respect to other objects or terrain, removed from the general flow of air traffic, or may be so conspicuous by its shape, size, or color that marking or lighting would serve no useful purpose.

3. ***Voluntary Marking and/or Lighting***. The object may be so located with respect to other objects or terrain that the sponsor feels increased conspicuity would better serve aviation safety. Sponsors who desire to voluntarily mark and/or light their structure should request the proper marking and/or lighting from the FAA to ensure no aviation safety issues are impacted.

4. ***Marking or Lighting an Object in Accordance with the Standards for an Object of Greater Height or Size.*** The object may present such an extraordinary hazard potential that higher standards may be recommended for increased conspicuity to ensure the safety to air navigation.

c. ***Deviations***. The OES conducts an aeronautical study of the proposed deviation(s) and forwards its recommendation to FAA headquarters in Washington, DC, for final approval. Examples of deviations that may be considered:

1. Colors of objects.

2. Dimensions of color bands or rectangles.

3. Colors/types of lights.

4. Basic signals and intensity of lighting.

5. Night/day lighting combinations.

6. Flash rate.

d. The FAA strongly recommends that owners become familiar with the different types of lighting systems and to specifically request the type of lighting system desired when submitting FAA Form 7460-1. (This request should be noted in "item 2.D" of the FAA form.) Information on these systems can be found in Chapter 12, Table 4 of this AC. While the FAA will make every effort to accommodate the structure sponsor's request, sponsors should also request information from system manufacturers in order to determine which system best meets their needs based on purpose, installation, and maintenance costs.

6. ADDITIONAL NOTIFICATION

Sponsors are reminded that any change to the submitted information on which the FAA has based its determination, including modification, deviation or optional upgrade to white lighting on structures which are regulated by the FCC, must also be filed with the FCC prior to making the change for proper authorization and annotations of obstruction marking and lighting. These structures will be subject to inspection and enforcement of marking and lighting requirements by the FCC. FCC Forms and Bulletins can be obtained from the FCC's National Call Center at 1-888-CALL-FCC (1-888-225-5322). Upon completion of the actual change, notify the Aeronautical Charting office at:

NOAA/NOS
Aeronautical Charting Division
Station 5601, N/ACC113
1305 East-West Highway
Silver Spring, MD 20910-3233

7. METRIC UNITS

To promote an orderly transition to metric units, sponsors should include both English and metric (SI units) dimensions. The metric conversions may not be exact equivalents, however, until there is an official changeover to the metric system, the English dimensions will govern.

CHAPTER 2. GENERAL

20. STRUCTURES TO BE MARKED AND LIGHTED

Any temporary or permanent structure, including all appurtenances, that exceeds an overall height of 200 feet (61m) above ground level (AGL) or exceeds any obstruction standard contained in 14 CFR part 77, should normally be marked and/or lighted. However, an FAA aeronautical study may reveal that the absence of marking and/or lighting will not impair aviation safety. Conversely, the object may present such an extraordinary hazard potential that higher standards may be recommended for increased conspicuity to ensure safety to air navigation. Normally outside commercial lighting is not considered sufficient reason to omit recommended marking and/or lighting. Recommendations on marking and/or lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structures and overall layout of design. The FAA may also recommend marking and/or lighting a structure that does not exceed 200 (61m) feet AGL or 14 CFR part 77 standards because of its particular location.

21. GUYED STRUCTURES

The guys of a 2,000-foot (610m) skeletal tower are anchored from 1,600 feet (488m) to 2,000 feet (610m) from the base of the structure. This places a portion of the guys 1,500 feet (458m) from the tower at a height of between 125 feet (38m) to 500 feet (153m) AGL. 14 CFR part 91, section 119, requires pilots, when operating over other than congested areas, to remain at least 500 feet (153m) from man-made structures. Therefore, the tower must be cleared by 2,000 feet (610m) horizontally to avoid all guy wires. Properly maintained marking and lighting are important for increased conspicuity since the guys of a structure are difficult to see until aircraft are dangerously close.

22. MARKING AND LIGHTING EQUIPMENT

Considerable effort and research have been expended in determining the minimum marking and lighting systems or quality of materials that will produce an acceptable level of safety to air navigation. The FAA will recommend the use of only those marking and lighting systems that meet established technical standards. While additional lights may be desirable to identify an obstruction to air navigation and may, on occasion be recommended, the FAA will recommend minimum standards in the interest of safety, economy, and related concerns. Therefore, to provide an adequate level of safety, obstruction lighting systems should be installed, operated, and maintained in accordance with the recommended standards herein.

23. LIGHT FAILURE NOTIFICATION

a. Sponsors should keep in mind that conspicuity is achieved only when all recommended lights are working. Partial equipment outages decrease the margin of safety. Any outage should be corrected as soon as possible. Failure of a steady burning side or intermediate light should be corrected as soon as possible, but notification is not required.

b. Any failure or malfunction that lasts more than thirty (30) minutes and affects a top light or flashing obstruction light, regardless of its position, should be reported immediately to the appropriate flight service station (FSS) so a Notice to Airmen (NOTAM) can be issued. Toll-free numbers for FSS are listed in most telephone books or on the web at http://www.afss.com. This report should contain the following information:

1. Name of persons or organizations reporting light failures including any title, address, and telephone number.

2. The type of structure.

3. Location of structure (including latitude and longitude, if known, prominent structures, landmarks, etc.).

4. Height of structure above ground level (AGL)/above mean sea level (AMSL), if known.

5. A return to service date.

6. FCC Antenna Registration Number (for structures that are regulated by the FCC).

Note-
1. *When the primary lamp in a double obstruction light fails, and the secondary lamp comes on, no report is required. However, when one of the lamps in an incandescent L-864 flashing red beacon fails, it should be reported.*

2. *After 15 days, the NOTAM is automatically deleted from the system. The sponsor is responsible for calling the nearest FSS to extend the outage date or to report a return to service date.*

24. NOTIFICATION OF RESTORATION

As soon as normal operation is restored, notify the same FSS that received the notification of failure. The FCC advises that noncompliance with notification procedures could subject its sponsor to penalties or monetary forfeitures.

25. FCC REQUIREMENT

FCC licensees are required to file an environmental assessment with the Commission when seeking authorization for the use of the high intensity flashing white lighting system on structures located in residential neighborhoods, as defined by the applicable zoning law.

CHAPTER 3. MARKING GUIDLINES

30. PURPOSE

This chapter provides recommended guidelines to make certain structures conspicuous to pilots during daylight hours. One way of achieving this conspicuity is by painting and/or marking these structures. Recommendations on marking structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structures and overall layout of design.

31. PAINT COLORS

Alternate sections of aviation orange and white paint should be used as they provide maximum visibility of an obstruction by contrast in colors.

32. PAINT STANDARDS

The following standards should be followed. To be effective, the paint used should meet specific color requirements when freshly applied to a structure. Since all outdoor paints deteriorate with time and it is not practical to give a maintenance schedule for all climates, surfaces should be repainted when the color changes noticeably or its effectiveness is reduced by scaling, oxidation, chipping, or layers of contamination.

a. ***Materials and Application***. Quality paint and materials should be selected to provide extra years of service. The paint should be compatible with the surfaces to be painted, including any previous coatings, and suitable for the environmental conditions. Surface preparation and paint application should be in accordance with manufacturer's recommendations.

Note-
In-Service Aviation Orange Color Tolerance Charts are available from private suppliers for determining when repainting is required. The color should be sampled on the upper half of the structure, since weathering is greater there.

b. ***Surfaces Not Requiring Paint.*** Ladders, decks, and walkways of steel towers and similar structures need not be painted if a smooth surface presents a potential hazard to maintenance personnel. Paint may also be omitted from precision or critical surfaces if it would have an adverse effect on the transmission or radiation characteristics of a signal. However, the overall marking effect of the structure should not be reduced.

c. ***Skeletal Structures***. Complete all marking/painting prior to or immediately upon completion of construction. This applies to catenary support structures, radio and television towers, and similar skeletal structures. To be effective, paint should be applied to all inner and outer surfaces of the framework.

33. PAINT PATTERNS

Paint patterns of various types are used to mark structures. The pattern to be used is determined by the size and shape of the structure. The following patterns are recommended.

a. ***Solid Pattern***. Obstacles should be colored aviation orange if the structure has both horizontal and vertical dimensions not exceeding 10.5 feet (3.2m).

b. ***Checkerboard Pattern***. Alternating rectangles of aviation orange and white are normally displayed on the following structures:

1. Water, gas, and grain storage tanks.

2. Buildings, as required.

3. Large structures exceeding 10.5 feet (3.2m) across having a horizontal dimension that is equal to or greater than the vertical dimension.

c. ***Size of Patterns***. Sides of the checkerboard pattern should measure not less than 5 feet (1.5m) or more than 20 feet (6m) and should be as nearly square as possible. However, if it is impractical because of the size or shape of a structure, the patterns may have sides less than 5 feet (1.5m). When possible, corner surfaces should be colored orange.

d. ***Alternate Bands***. Alternate bands of aviation orange and white are normally displayed on the following structures:

1. Communication towers and catenary support structures.

2. Poles.

3. Smokestacks.

4. Skeletal framework of storage tanks and similar structures.

5. Structures which appear narrow from a side view, that are 10.5 feet (3.2m) or more across and the horizontal dimension is less than the vertical dimension.

6. Coaxial cable, conduits, and other cables attached to the face of a tower.

e. ***Color Band Characteristics***. Bands for structures of any height should be:

1. Equal in width, provided each band is not less than $1^1/_2$ feet (0.5m) or more than 100 feet (31m) wide.

2. Perpendicular to the vertical axis with the bands at the top and bottom ends colored orange.

3. An odd number of bands on the structure.

4. Approximately one-seventh the height if the structure is 700 feet (214m) AGL or less. For each additional 200 feet (61m) or fraction thereof, add one (1) additional orange and one (1) additional white band.

5. Equal and in proportion to the structure's height AGL.

Structure Height to Bandwidth Ratio

Example: If a Structure is:		
Greater Than	**But Not More Than**	**Band Width**
10.5 feet (3.2m)	700 feet (214m)	$^1/_7$ of height
701 feet (214m)	900 feet (275m)	$^1/_9$ of height
901 feet (275m)	1,100 feet (336m)	$^1/_{11}$ of height
1,100 feet (336m)	1,300 feet (397m)	$^1/_{13}$ of height

TBL 1

f. ***Structures With a Cover or Roof***. If the structure has a cover or roof, the highest orange band should be continued to cover the entire top of the structure.

g. ***Skeletal Structures Atop Buildings***. If a flagpole, skeletal structure, or similar object is erected on top of a building, the combined height of the object and building will determine whether marking is recommended; however, only the height of the object under study determines the width of the color bands.

h. ***Partial Marking***. If marking is recommended for only a portion of a structure because of shielding by other objects or terrain, the width of the bands should be determined by the overall height of the structure. A minimum of three bands should be displayed on the upper portion of the structure.

i. ***Teardrop Pattern***. Spherical water storage tanks with a single circular standpipe support may be marked in a teardrop-striped pattern. The tank should show alternate stripes of aviation orange and white. The stripes should extend from the top center of the tank to its supporting standpipe. The width of the stripes should be equal, and the width of each stripe at the greatest girth of the tank should not be less than 5 feet (1.5m) nor more than 15 feet (4.6m).

j. ***Community Names***. If it is desirable to paint the name of the community on the side of a tank, the stripe pattern may be broken to serve this purpose. This open area should have a maximum height of 3 feet (0.9m).

k. ***Exceptions.*** Structural designs not conducive to standard markings may be marked as follows:

1. If it is not practical to color the roof of a structure in a checkerboard pattern, it may be colored solid orange.

2. If a spherical structure is not suitable for an exact checkerboard pattern, the shape of the rectangles may be modified to fit the shape of the surface.

3. Storage tanks not suitable for a checkerboard pattern may be colored by alternating bands of aviation orange and white or a limited checkerboard pattern applied to the upper one-third of the structure.

4. The skeletal framework of certain water, gas, and grain storage tanks may be excluded from the checkerboard pattern.

34. MARKERS

Markers are used to highlight structures when it is impractical to make them conspicuous by painting. Markers may also be used in addition to aviation orange and white paint when additional conspicuity is necessary for aviation safety. They should be displayed in conspicuous positions on or adjacent to the structures so as to retain the general definition of the structure. They should be recognizable in clear air from a distance of at least 4,000 feet (1219m) and in all directions from which aircraft are likely to approach. Markers should be distinctively shaped, i.e., spherical or cylindrical, so they are not mistaken for items that are used to convey other information. They should be replaced when faded or otherwise deteriorated.

a. ***Spherical Markers***. Spherical markers are used to identify overhead wires. Markers may be of another shape, i.e., cylindrical, provided the projected area of such markers will not be less than that presented by a spherical marker.

1. *Size and Color*.

The diameter of the markers used on extensive catenary wires across canyons, lakes, rivers, etc., should be not less than 36 inches (91cm). Smaller 20-inch (51cm) spheres are permitted on less extensive power lines or on power lines below 50 feet (15m) above the ground and within 1,500 feet (458m) of an airport runway end. Each marker should be a solid color such as aviation orange, white, or yellow.

2. ***Installations.***

(a) *Spacing.* Markers should be spaced equally along the wire at intervals of approximately 200 feet (61m) or a fraction thereof. Intervals between markers should be less in critical areas near runway ends (i.e., 30 to 50 feet (10m to 15m)). They should be displayed on the highest wire or by another means at the same height as the highest wire. Where there is more than one wire at the highest point, the markers may be installed alternately along each wire if the distance between adjacent markers meets the spacing standard. This method allows the weight and wind loading factors to be distributed.

(b) *Pattern*. An alternating color scheme provides the most conspicuity against all backgrounds. Mark overhead wires by alternating solid colored markers of aviation orange, white, and yellow. Normally, an orange sphere is placed at each end of a line and the spacing is adjusted (not to exceed 200 feet (61m)) to accommodate the rest of the markers. When less than four markers are used, they should all be aviation orange.

b. ***Flag Markers***. Flags are used to mark certain structures or objects when it is technically impractical to use spherical markers or painting. Some examples are temporary construction equipment, cranes, derricks, oil and other drilling rigs. Catenaries should use spherical markers.

1. *Minimum Size*. Each side of the flag marker should be at least 2 feet (0.6m) in length.

2. ***Color Patterns***. Flags should be colored as follows:

(a) ***Solid***. Aviation orange.

(b) *Orange and White*. Arrange two triangular sections, one aviation orange and the other white to form a rectangle.

(c) *Checkerboard.* **Flags** 3 feet (0.9m) or larger should be a checkerboard pattern of aviation orange and white squares, each 1 foot (0.3m) plus or minus 10 percent.

3. ***Shape***. Flags should be rectangular in shape and have stiffeners to keep them from drooping in calm wind.

4. ***Display***. Flag markers should be displayed around, on top, or along the highest edge of the obstruction. When flags are used to mark extensive or closely grouped obstructions, they should be displayed approximately 50 feet (15m) apart. The flag stakes should be of such strength and height that they will support the flags above all surrounding ground, structures, and/or objects of natural growth.

35. UNUSUAL COMPLEXITIES

The FAA may also recommend appropriate marking in an area where obstructions are so grouped as to present a common obstruction to air navigation.

36. OMISSION OR ALTERNATIVES TO MARKING

There are two alternatives to marking. Either alternative requires FAA review and concurrence.

a. ***High Intensity Flashing White Lighting Systems***. The high intensity lighting systems are more effective than aviation orange and white paint and therefore can be recommended instead of marking. This is particularly true under certain ambient light conditions involving the position of the sun relative to the direction of flight. When high intensity lighting systems are operated during daytime and twilight, other methods of marking may be omitted. When operated 24 hours a day, other methods of marking and lighting may be omitted.

b. ***Medium Intensity Flashing White Lighting Systems.*** When medium intensity lighting systems are operated during daytime and twilight on structures 500 feet (153m) AGL or less, other methods of marking may be omitted. When operated 24 hours a day on structures 500 feet (153m) AGL or less, other methods of marking and lighting may be omitted.

Note-
SPONSORS MUST ENSURE THAT ALTERNATIVES TO MARKING ARE COORDINATED WITH THE FCC FOR STRUCTURES UNDER ITS JURISDICTION PRIOR TO MAKING THE CHANGE.

CHAPTER 4. LIGHTING GUIDELINE

40. PURPOSE

This chapter describes the various obstruction lighting systems used to identify structures that an aeronautical study has determined will require added conspicuity. The lighting standards in this circular are the minimum necessary for aviation safety. Recommendations on lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structures and overall layout of design.

41. STANDARDS

The standards outlined in this AC are based on the use of light units that meet specified intensities, beam patterns, color, and flash rates as specified in AC 150/5345-43.

These standards may be obtained from:

Department of Transportation
OTS
Subsequent Distribution Office, M-30
Ardmore East Business Center
3341 Q 75th Avenue
Landover, MD 20785

42. LIGHTING SYSTEMS

Obstruction lighting may be displayed on structures as follows:

a. ***Aviation Red Obstruction Lights***. Use flashing beacons and/or steady burning lights during nighttime.

b. ***Medium Intensity Flashing White Obstruction Lights.*** Medium intensity flashing white obstruction lights may be used during daytime and twilight with automatically selected reduced intensity for nighttime operation. When this system is used on structures 500 feet (153m) AGL or less in height, other methods of marking and lighting the structure may be omitted. Aviation orange and white paint is always required for daytime marking on structures exceeding 500 feet (153m) AGL. This system is not normally recommended on structures 200 feet (61m) AGL or less.

c. ***High Intensity Flashing White Obstruction Lights***. Use high intensity flashing white obstruction lights during daytime with automatically selected reduced intensities for twilight and nighttime operations. When this system is used, other methods of marking and lighting the structure may be omitted. This system should not be recommended on structures 500 feet (153m) AGL or less, unless an FAA aeronautical study shows otherwise.

Note-
All flashing lights on a structure should flash simultaneously except for catenary support structures, which have a distinct sequence flashing between levels.

d. ***Dual Lighting***. This system consists of red lights for nighttime and high or medium intensity flashing white lights for daytime and twilight. When a dual lighting system incorporates medium flashing intensity lights on structures 500 feet (153m) or less, or high intensity flashing white lights on structures of any height, other methods of marking the structure may be omitted.

e. ***Obstruction Lights During Construction***. As the height of the structure exceeds each level at which permanent obstruction lights would be recommended, two or more lights of the type specified in the determination should be installed at that level. Temporary high or medium intensity flashing white lights, as recommended in the determination, should be operated 24 hours a day until all permanent lights are in operation. In either case, two or more lights should be installed on the uppermost part of the structure any time it exceeds the height of the temporary construction equipment. They may be turned off for periods when they would interfere with construction personnel. If practical, permanent obstruction lights should be installed and operated at each level as construction progresses. The lights should be positioned to ensure that a pilot has an unobstructed view of at least one light at each level.

f. ***Obstruction Lights in Urban Areas***. When a structure is located in an urban area where there are numerous other white lights (e.g., streetlights, etc.) red obstruction lights with painting or a medium intensity dual system is recommended. Medium intensity lighting is not normally recommended on structures less than 200 feet (61m).

g. ***Temporary Construction Equipment Lighting***. Since there is such a variance in construction cranes, derricks, oil and other drilling rigs, each case should be considered individually. Lights should be installed according to the standards given in Chapters 5, 6, 7, or 8, as they would apply to permanent structures.

43. CATENARY LIGHTING

Lighted markers are available for increased night conspicuity of high-voltage (69KV or greater) transmission line catenary wires. These markers should be used on transmission line catenary wires near airports, heliports, across rivers, canyons, lakes, etc. The lighted markers should be manufacturer certified as recognizable from a minimum distance of 4,000 feet (1219m) under nighttime conditions, minimum visual flight rules (VFR) conditions or having a minimum intensity of at least 32.5 candela. The lighting unit should emit a steady burning red light. They should be used on the highest energized line. If the lighted markers are installed on a line other than the highest catenary, then markers specified in paragraph 34 should be used in addition to the lighted markers. (The maximum distance between the line energizing the lighted markers and the highest catenary above the lighted marker should be no more than 20 feet (6m).) Markers should be distinctively shaped, i.e., spherical, cylindrical, so they are not mistaken for items that are used to convey other information. They should be visible in all directions from which aircraft are likely to approach. The area in the immediate vicinity of the supporting structure's base should be clear of all items and/or objects of natural growth that could interfere with the line-of-sight between a pilot and the structure's lights. Where a catenary wire crossing requires three or more supporting structures, the inner structures should be equipped with enough light units per level to provide a full coverage.

44. INSPECTION, REPAIR AND MAINTENANCE

To ensure the proper candela output for fixtures with incandescent lamps, the voltage provided to the lamp filament should not vary more than plus or minus 3 percent of the rated voltage of the lamp. The input voltage should be measured at the lamp socket with the lamp operating during the hours of normal operation. (For strobes, the input voltage of the power supplies should be within 10 percent of rated voltage.) Lamps should be replaced after being operated for not more than 75 percent of their rated life or immediately upon failure. Flashtubes in a light unit should be replaced immediately upon failure, when the peak effective intensity falls below specification limits or when the fixture begins skipping flashes, or at the manufacturer's recommended intervals. Due to the effects of harsh environments, beacon lenses should be visually inspected for ultraviolet damage, cracks, crazing, dirt build up, etc., to insure that the certified light output has not deteriorated. (See paragraph 23, for reporting requirements in case of failure.)

45. NONSTANDARD LIGHTS

Moored balloons, chimneys, church steeples, and similar obstructions may be floodlighted by fixed search light projectors installed at three or more equidistant points around the base of each obstruction. The searchlight projectors should provide an average illumination of at least 15 foot-candles over the top one-third of the obstruction.

46. PLACEMENT FACTORS

The height of the structure AGL determines the number of light levels. The light levels may be adjusted slightly, but not to exceed 10 feet (3m), when necessary to accommodate guy wires and personnel who replace or repair light fixtures. Except for catenary support structures, the following factors should be considered when determining the placement of obstruction lights on a structure.

a. ***Red Obstruction Lighting Systems***. The overall height of the structure including all appurtenances such as rods, antennas, obstruction lights, etc., determines the number of light levels.

b. ***Medium Intensity Flashing White Obstruction Lighting Systems***. The overall height of the structure including all appurtenances such as rods, antennas, obstruction lights, etc., determines the number of light levels.

c. ***High Intensity Flashing White Obstruction Lighting Systems***. The overall height of the main structure including all appurtenances such as rods, antennas, obstruction lights, etc., determines the number of light levels.

d. ***Dual Obstruction Lighting Systems***. The overall height of the structure including all appurtenances such as rods, antennas, obstruction lights, etc., is used to determine the number of light levels for a medium intensity white obstruction light/red obstruction dual lighting system. The overall height of the structure including all appurtenances is used to determine the number of light levels for a high intensity white obstruction light/red obstruction dual lighting system.

e. ***Adjacent Structures***. The elevation of the tops of adjacent buildings in congested areas may be used as the equivalent of ground level to determine the proper number of light levels required.

f. ***Shielded Lights***. If an adjacent object shields any light, horizontal placement of the lights should be adjusted or additional lights should be mounted on that object to retain or contribute to the definition of the obstruction.

47. MONITORING OBSTRUCTION LIGHTS

Obstruction lighting systems should be closely monitored by visual or automatic means. It is extremely important to visually inspect obstruction lighting in all operating intensities at least once every 24 hours on systems without automatic monitoring. In the event a structure is not readily accessible for visual observation, a properly maintained automatic monitor should be used. This monitor should be designed to register the malfunction of any light on the obstruction regardless of its position or color. When using remote monitoring devices, the communication status and operational status of the system should be confirmed at least once every 24 hours. The monitor (aural or visual) should be located in an area generally occupied by responsible personnel. In some cases, this may require a remote monitor in an attended location. For each structure, a log should be maintained in which daily operations status of the lighting system is recorded. Beacon lenses should be replaced if serious cracks, crazing, dirt build up, etc., has occurred.

48. ICE SHIELDS

Where icing is likely to occur, metal grates or similar protective ice shields should be installed directly over each light unit to prevent falling ice or accumulations from damaging the light units.

49. DISTRACTION

a. Where obstruction lights may distract operators of vessels in the proximity of a navigable waterway, the sponsor must coordinate with the Commandant, U.S. Coast Guard, to avoid interference with marine navigation.

b. The address for marine information and coordination is:

Chief, Aids to Navigation
Division (OPN)
U.S. Coast Guard Headquarters
2100 2nd Street, SW., Rm. 3610
Washington, DC 20593-0001
Telephone: (202) 267-0980

CHAPTER 5. RED OBSTRUCTION LIGHT SYSTEM

50. PURPOSE

Red Obstruction lights are used to increase conspicuity during nighttime. Daytime and twilight marking is required. Recommendations on lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structutes and overall layout of design.

51. STANDARDS

The red obstruction lighting system is composed of flashing omnidirectional beacons (L-864) and/or steady burning (L-810) lights. When one or more levels is comprised of flashing beacon lighting, the lights should flash simultaneously.

a. ***Single Obstruction Light***. A single (L-810) light may be used when more than one obstruction light is required either vertically or horizontally or where maintenance can be accomplished within a reasonable time.

1. *Top Level*. A single light may be used to identify low structures such as airport ILS buildings and long horizontal structures such as perimeter fences and building roof outlines.

2. ***Intermediate Level***. Single lights may be used on skeletal and solid structures when more than one level of lights is installed and there are two or more single lights per level.

b. ***Double Obstruction Light***. A double (L-810) light should be installed when used as a top light, at each end of a row of single obstruction lights, and in areas or locations where the failure of a single unit could cause an obstruction to be totally unlighted.

1. ***Top Level.*** **Structures** 150 feet (46m) AGL or less should have one or more double lights installed at the highest point and operating simultaneously.

2. ***Intermediate Level***. Double lights should be installed at intermediate levels when a malfunction of a single light could create an unsafe condition and in remote areas where maintenance cannot be performed within a reasonable time. Both units may operate simultaneously, or a transfer relay may be used to switch to a spare unit should the active system fail.

3. ***Lowest Level***. The lowest level of light units may be installed at a higher elevation than normal on a structure if the surrounding terrain, trees, or adjacent building(s) would obscure the lights. In certain instances, as determined by an FAA aeronautical study, the lowest level of lights may be eliminated.

52. CONTROL DEVICE

Red obstruction lights should be operated by a satisfactory control device (e.g., photo cell, timer, etc.) adjusted so the lights will be turned on when the northern sky illuminance reaching a vertical surface falls below a level of 60 foot-candles (645.8 lux) but before reaching a level of 35 foot-candles (367.7 lux). The control device should turn the lights off when the northern sky illuminance rises to a level of not more than 60 foot-candles (645.8 lux). The lights may also remain on continuously. The sensing device should, if practical, face the northern sky in the Northern Hemisphere. (See AC 150/5345-43.)

53. POLES, TOWERS, AND SIMILAR SKELETAL STRUCTURES

The following standards apply to radio and television towers, supporting structures for overhead transmission lines, and similar structures.

a. ***Top Mounted Obstruction Light.***

1. *Structures 150 Feet (46m) AGL or Less*. Two or more steady burning (L-810) lights should be installed in a manner to ensure an unobstructed view of one or more lights by a pilot.

2. ***Structures Exceeding 150 Feet (46m) AGL***. At least one red flashing (L-864) beacon should be installed in a manner to ensure an unobstructed view of one or more lights by a pilot.

3. ***Appurtenances 40 Feet (12m) or Less***. If a rod, antenna, or other appurtenance 40 feet (12m) or less in height is incapable of supporting a red flashing beacon, then it may be placed at the base of the appurtenance. If the mounting location does not allow unobstructed viewing of the beacon by a pilot, then additional beacons should be added.

4. ***Appurtenances Exceeding 40 Feet (12m)***. If a rod, antenna, or other appurtenance exceeding 40 feet (12m) in height is incapable of supporting a red flashing beacon, a supporting mast with one or more beacons should be installed adjacent to the appurtenance. Adjacent installations should not exceed the height of the appurtenance and be within 40 feet (12m) of the tip to allow the pilot an unobstructed view of at least one beacon.

b. ***Mounting Intermediate Levels***. The number of light levels is determined by the height of the structure, including all appurtenances, and is detailed in Appendix 1. The number of lights on each level is

determined by the shape and height of the structure. These lights should be mounted so as to ensure an unobstructed view of at least one light by a pilot.

1. ***Steady Burning Lights (L-810).***

(a) ***Structures 350 Feet (107m) AGL or Less***. Two or more steady burning (L-810) lights should be installed on diagonally or diametrically opposite positions.

(b) ***Structures Exceeding 350 Feet (107m) AGL.*** Install steady burning (L-810) lights on each outside corner of each level.

2. ***Flashing Beacons (L-864).***

(a) ***Structures 350 Feet (107m) AGL or Less***. These structures do not require flashing (L-864) beacons at intermediate levels.

(b) ***Structure Exceeding 350 Feet (107m) AGL***. At intermediate levels, two beacons (L-864) should be mounted outside at diagonally opposite positions of intermediate levels.

54. CHIMNEYS, FLARE STACKS, AND SIMILAR SOLID STRUCTURES

a. *Number of Light Units.*

1. The number of units recommended depends on the diameter of the structure at the top. The number of lights recommended below are the minimum.

2. When the structure diameter is:

(a) *20 Feet (6m) or Less.* Three light units per level.

(b) *Exceeding 20 Feet (6m) But Not More Than 100 Feet (31m).* Four light units per level.

(c) *Exceeding 100 Feet (31m) But Not More Than 200 Feet (61m).* Six light units per level.

(d) *Exceeding 200 Feet (61m).* Eight light units per level.

b. ***Top Mounted Obstruction Lights***.

1. *Structures 150 Feet (46m) AGL or Less.* L-810 lights should be installed horizontally at regular intervals at or near the top.

2. *Structures Exceeding 150 Feet (46m) AGL.* At least three L-864 beacons should be installed.

3. *Chimneys, Cooling Towers, and Flare Stacks.* Lights may be displayed as low as 20 feet (6m) below the top to avoid the obscuring effect of deposits and heat generally emitted by this type of structure. It is important that these lights be readily accessible for cleaning and lamp replacement. It is understood that with flare stacks, as well as any other structures associated with the petrol-chemical industry, normal lighting requirements may not be necessary. This could be due to the location of the flare stack/structure within a large well-lighted petrol-chemical plant or the fact that the flare, or working lights surrounding the flare stack/structure, is as conspicuous as obstruction lights.

c. ***Mounting Intermediate Levels***. The number of light levels is determined by the height of the structure including all appurtenances. For cooling towers 600 feet (183m) or less, intermediate light levels are not necessary. Structures exceeding 600 feet (183m) AGL should have a second level of light units installed approximately at the midpoint of the structure and in a vertical line with the top level of lights.

1. ***Steady Burning (L-810) Lights***. The recommended number of light levels may be obtained from Appendix 1. At least three lights should be installed on each level.

2. ***Flashing (L-864) Beacons***. The recommended number of beacon levels may be obtained from Appendix 1. At least three lights should be installed on each level.

(a) *Structures 350 Feet (107m) AGL or Less.* These structures do not need intermediate levels of flashing beacons.

(b) *Structures Exceeding 350 Feet (107m) AGL.* At least three flashing (L-864) beacons should be installed on each level in a manner to allow an unobstructed view of at least one beacon.

55. GROUP OF OBSTRUCTIONS

When individual objects, except wind turbines, within a group of obstructions are not the same height and are spaced a maximum of 150 feet (46m) apart, the prominent objects within the group should be lighted in accordance with the standards for individual obstructions of a corresponding height. If the outer structure is shorter than the prominent, the outer structure should be lighted in accordance with the standards for individual obstructions of a corresponding height. Light units should be placed to ensure that the light is visible to a pilot approaching from **any** direction. In addition, at least one flashing beacon should be installed at the top of a prominent center obstruction or on a special tower located near the center of the group.

56. ALTERNATE METHOD OF DISPLAYING OBSTRUCTION LIGHTS

When recommended in an FAA aeronautical study, lights may be placed on poles equal to the height of the obstruction and installed on or adjacent to the structure instead of installing lights on the obstruction.

57. PROMINENT BUILDINGS, BRIDGES, AND SIMILAR EXTENSIVE OBSTRUCTIONS

When objects within a group of obstructions are approximately the same overall height above the surface and are located a maximum of 150 feet (46m) apart, the group of obstructions may be considered an extensive obstruction. Install light units on the same horizontal plane at the highest portion or edge of prominent obstructions. Light units should be placed to ensure that the light is visible to a pilot approaching from **any** direction. If the structure is a bridge and is over navigable water, the sponsor must obtain prior approval of the lighting installation from the Commander of the District Office of the United States Coast Guard to avoid interference with marine navigation. Steady burning lights should be displayed to indicate the extent of the obstruction as follows:

a. ***Structures 150 Feet (46m) or Less in Any Horizontal Direction***. If the structure/bridge/extensive obstruction is 150 feet (46m) or less horizontally, at least one steady burning light (L-810) should be displayed on the highest point at each end of the major axis of the obstruction. If this is impractical because of the overall shape, display a double obstruction light in the center of the highest point.

b. ***Structures Exceeding 150 Feet (46m) in at Least One Horizontal Direction***. If the structure/bridge/ extensive obstruction exceeds 150 feet (46m) horizontally, display at least one steady burning light for each 150 feet (46m), or fraction thereof, of the overall length of the major axis. At least one of these lights should be displayed on the highest point at each end of the obstruction. Additional lights should be displayed at approximately equal intervals not to exceed 150 feet (46m) on the highest points along the edge between the end lights. If an obstruction is located near a landing area and two or more edges are the same height, the edge nearest the landing area should be lighted.

c. ***Structures Exceeding 150 Feet (46m) AGL***. Steady burning red obstruction lights should be installed on the highest point at each end. At intermediate levels, steady burning red lights should be displayed for each 150 feet (46m) or fraction thereof. The vertical position of these lights should be equidistant between the top lights and the ground level as the shape and type of obstruction will permit. One such light should be displayed at each outside corner on each level with the remaining lights evenly spaced between the corner lights.

d. ***Exceptions***. Flashing red beacons (L-864) may be used instead of steady burning obstruction lights if early or special warning is necessary. These beacons should be displayed on the highest points of an extensive obstruction at intervals not exceeding 3,000 feet (915m). At least three beacons should be displayed on one side of the extensive obstruction to indicate a line of lights.

e. ***Ice Shields***. Where icing is likely to occur, metal grates or similar protective ice shields should be installed directly over each light unit to prevent falling ice or accumulations from damaging the light units. The light should be mounted in a manner to ensure an unobstructed view of at least one light by a pilot approaching from any direction.

CHAPTER 6. MEDIUM INTENSITY FLASHING WHITE OBSTRUCTION LIGHT SYSTEMS

60. PURPOSE

Medium intensity flashing white (L-865) obstruction lights may provide conspicuity both day and night. Recommendations on lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structures and overall layout of design.

61. STANDARDS

The medium intensity flashing white light system is normally composed of flashing omnidirectional lights. Medium intensity flashing white obstruction lights may be used during daytime and twilight with automatically selected reduced intensity for nighttime operation. When this system is used on structures 500 feet (153m) AGL or less in height, other methods of marking and lighting the structure may be omitted. Aviation orange and white paint is always required for daytime marking on structures exceeding 500 feet (153m) AGL. This system is not normally recommended on structures 200 feet (61m) AGL or less.

The use of a 24-hour medium intensity flashing white light system in urban/populated areas in not normally recommended due to their tendency to merge with background lighting in these areas at night. This makes it extremely difficult for some types of aviation operations, i.e., med-evac, and police helicopters to see these structures. The use of this type of system in urban and rural areas often results in complaints. In addition, this system is not recommended on structures within 3 nautical miles of an airport.

62. RADIO AND TELEVISION TOWERS AND SIMILAR SKELETAL STRUCTURES

a. ***Mounting Lights***. The number of levels recommended depends on the height of the structure, including antennas and similar appurtenances.

1. ***Top Levels***. One or more lights should be installed at the highest point to provide 360-degree coverage ensuring an unobstructed view.

2. ***Appurtenances 40 feet (12m) or less***. If a rod, antenna, or other appurtenance 40 feet (12m) or less in height is incapable of supporting the medium intensity flashing white light, then it may be placed at the base of the appurtenance. If the mounting location does not allow unobstructed viewing of the medium intensity flashing white light by a pilot, then additional lights should be added.

3. ***Appurtenances Exceeding 40 feet (12m)***. If a rod, antenna, or other appurtenance exceeds 40 feet (12m) above the tip of the main structure, a medium intensity flashing white light should be placed within 40 feet (12m) from the top of the appurtenance. If the appurtenance (such as a whip antenna) is incapable of supporting the light, one or more lights should be mounted on a pole adjacent to the appurtenance. Adjacent installations should not exceed the height of the appurtenance and be within 40 feet (12m) of the tip to allow the pilot an unobstructed view of at least one light.

b. ***Intermediate Levels***. At intermediate levels, two beacons (L-865) should be mounted outside at diagonally or diametrically opposite positions of intermediate levels. The lowest light level should not be less than 200 feet (61m) AGL.

c. ***Lowest Levels***. The lowest level of light units may be installed at a higher elevation than normal on a structure if the surrounding terrain, trees, or adjacent building(s) would obscure the lights. In certain instances, as determined by an FAA aeronautical study, the lowest level of lights may be eliminated.

d. ***Structures 500 Feet (153m) AGL or Less***. When white lights are used during nighttime and twilight only, marking is required for daytime. When operated 24 hours a day, other methods of marking and lighting are not required.

e. ***Structures Exceeding 500 Feet (153m) AGL***. The lights should be used during nighttime and twilight and may be used 24 hours a day. Marking is always required for daytime.

f. ***Ice Shields***. Where icing is likely to occur, metal grates or similar protective ice shields should be installed directly over each light unit to prevent falling ice or accumulations from damaging the light units. The light should be mounted in a manner to ensure an unobstructed view of at least one light by a pilot approaching from any direction.

63. CONTROL DEVICE

The light intensity is controlled by a device that changes the intensity when the ambient light changes. The system should automatically change intensity steps when the northern sky illumination in the Northern Hemisphere on a vertical surface is as follows:

a. ***Twilight-to-Night***. This should not occur before the illumination drops below five foot-candles (53.8

lux) but should occur before it drops below two foot-candles (21.5 lux).

b. ***Night-to-Day***. The intensity changes listed in subparagraph 63a above should be reversed when changing from the night to day mode.

64. CHIMNEYS, FLARE STACKS, AND SIMILAR SOLID STRUCTURES

a. *Number of Light Units*. The number of units recommended depends on the diameter of the structure at the top. Normally, the top level is on the highest point of a structure. However, the top level of chimney lights may be installed as low as 20 feet (6m) below the top to minimize deposit build-up due to emissions. The number of lights recommended are the minimum. When the structure diameter is:

1. *20 Feet (6m) or Less*. Three light units per level.

2. *Exceeding 20 Feet (6m) But Not More Than 100 Feet (31m).* Four light units per level.

3. *Exceeding 100 Feet (31m) But Not More Than 200 Feet (61m).* Six light units per level.

4. *Exceeding 200 Feet (61m).* Eight light units per level.

65. GROUP OF OBSTRUCTIONS

When individual objects within a group of obstructions are not the same height and are spaced a maximum of 150 feet (46m) apart, the prominent objects within the group should be lighted in accordance with the standards for individual obstructions of a corresponding height. If the outer structure is shorter than the prominent, the outer structure should be lighted in accordance with the standards for individual obstructions of a corresponding height. Light units should be placed to ensure that the light is visible to a pilot approaching from **any** direction. In addition, at least one medium intensity flashing white light should be installed at the top of a prominent center obstruction or on a special tower located near the center of the group.

66. SPECIAL CASES

Where lighting systems are installed on structures located near highways, waterways, airport approach areas, etc., caution should be exercised to ensure that the lights do not distract or otherwise cause a hazard to motorists, vessel operators, or pilots on an approach to an airport. In these cases, shielding may be necessary. This shielding should not derogate the intended purpose of the lighting system.

67. PROMINENT BUILDINGS AND SIMILAR EXTENSIVE OBSTRUCTIONS

When objects within a group of obstructions are approximately the same overall height above the surface and are located a maximum of 150 feet (46m) apart, the group of obstructions may be considered an extensive obstruction. Install light units on the same horizontal plane at the highest portion or edge of prominent obstructions. Light units should be placed to ensure that the light is visible to a pilot approaching from **any** direction. Lights should be displayed to indicate the extent of the obstruction as follows:

a. *Structures 150 Feet (46m) or Less in Any Horizontal Direction.* If the structure/extensive obstruction is 150 feet (46m) or less horizontally, at least one light should be displayed on the highest point at each end of the major axis of the obstruction. If this is impractical because of the overall shape, display a double obstruction light in the center of the highest point.

b. ***Structures Exceeding 150 Feet (46m) in at Least One Horizontal Direction***. If the structure/extensive obstruction exceeds 150 feet (46m) horizontally, display at least one light for each 150 feet (46m) or fraction thereof, of the overall length of the major axis. At least one of these lights should be displayed on the highest point at each end of the obstruction. Additional lights should be displayed at approximately equal intervals not to exceed 150 feet (46m) on the highest points along the edge between the end lights. If an obstruction is located near a landing area and two or more edges are the same height, the edge nearest the landing area should be lighted.

c. ***Structures Exceeding 150 Feet (46m) AGL***. Lights should be installed on the highest point at each end. At intermediate levels, lights should be displayed for each 150 feet (46m), or fraction thereof. The vertical position of these lights should be equidistant between the top lights and the ground level as the shape and type of obstruction will permit. One such light should be displayed at each outside corner on each level with the remaining lights evenly spaced between the corner lights.

CHAPTER 7. HIGH INTENSITY FLASHING WHITE OBSTRUCTION LIGHT SYSTEMS

70. PURPOSE

Lighting with high intensity (L-856) flashing white obstruction lights provides the highest degree of conspicuity both day and night. Recommendations on lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structutes and overall layout of design.

71. STANDARDS

Use high intensity flashing white obstruction lights during daytime with automatically selected reduced intensities for twilight and nighttime operations. When high intensity white lights are operated 24 hours a day, other methods of marking and lighting may be omitted. This system should not be recommended on structures 500 feet (153m) AGL or less unless an FAA aeronautical study shows otherwise.

72. CONTROL DEVICE

Light intensity is controlled by a device that changes the intensity when the ambient light changes. The use of a 24-hour high intensity flashing white light system in urban/populated areas is not normally recommended due to their tendency to merge with background lighting in these areas at night. This makes it extremely difficult for some types of aviation operations, i.e., med-evac, and police helicopters to see these structures. The use of this type of system in urban and rural areas often results in complaints.

The system should automatically change intensity steps when the northern sky illumination in the Northern Hemisphere on a vertical surface is as follows:

a. ***Day-to-Twilight***. This should not occur before the illumination drops to 60 foot-candles (645.8 lux), but should occur before it drops below 35 foot-candles (376.7 lux). The illuminance-sensing device should, if practical, face the northern sky in the Northern Hemisphere.

b. ***Twilight-to-Night***. This should not occur before the illumination drops below five foot-candles (53.8 lux), but should occur before it drops below two foot-candles (21.5 lux).

c. ***Night-to-Day***. The intensity changes listed in subparagraph 72 a and b above should be reversed when changing from the night to day mode.

73. UNITS PER LEVEL

One or more light units is needed to obtain the desired horizontal coverage. The number of light units recommended per level (except for the supporting structures of catenary wires and buildings) depends upon the average outside diameter of the specific structure, and the horizontal beam width of the light fixture. The light units should be installed in a manner to ensure an unobstructed view of the system by a pilot approaching from any direction. The number of lights recommended are the minimum. When the structure diameter is:

a. *20 Feet (6m) or Less.* Three light units per level.

b. *Exceeding 20 Feet (6m) But Not More Than 100 Feet (31m).* Four light units per level.

c. *Exceeding 100 Feet (31m).* Six light units per level.

74. INSTALLATION GUIDANCE

Manufacturing specifications provide for the effective peak intensity of the light beam to be adjustable from zero to 8 degrees above the horizon. Normal installation should place the top light at zero degrees to the horizontal and all other light units installed in accordance with Table 2:

Light Unit Elevation Above the Horizontal

Height of Light Unit Above Terrain	Degrees of Elevation Above the Horizontal
Exceeding 500 feet AGL	0
401 feet to 500 feet AGL	1
301 feet to 400 feet AGL	2
300 feet AGL or less	3

TBL 2

a. ***Vertical Aiming***. Where terrain, nearby residential areas, or other situations dictate, the light beam may be further elevated above the horizontal. The main beam of light at the lowest level should not strike the ground closer than 3 statute miles (5km) from the structure. If additional adjustments are necessary, the lights may be individually adjusted upward, in 1-degree increments, starting at the bottom. Excessive elevation may reduce its conspicuity by raising the beam above a collision course flight path.

b. ***Special Cases***. Where lighting systems are installed on structures located near highways, waterways, airport approach areas, etc., caution should be exercised to ensure that the lights do not distract or otherwise cause a hazard to motorists, vessel operators, or pilots on an approach to an airport. In these cases,

shielding or an adjustment to the vertical or horizontal light aiming may be necessary. This adjustment should not derogate the intended purpose of the lighting system. Such adjustments may require review action as described in Chapter 1, paragraph 5.

c. ***Relocation or Omission of Light Units***. Light units should not be installed in such a manner that the light pattern/output is disrupted by the structure.

1. ***Lowest Level***. The lowest level of light units may be installed at a higher elevation than normal on a structure if the surrounding terrain, trees, or adjacent building(s) would obscure the lights. In certain instances, as determined by an FAA aeronautical study, the lowest level of lights may be eliminated.

2. ***Two Adjacent Structures***. Where two structures are situated within 500 feet (153m) of each other and the light units are installed at the same levels, the sides of the structures facing each other need not be lighted. However, all lights on both structures must flash simultaneously, except for adjacent catenary support structures. Adjust vertical placement of the lights to either or both structures' intermediate levels to place the lights on the same horizontal plane. Where one structure is higher than the other, complete level(s) of lights should be installed on that part of the higher structure that extends above the top of the lower structure. If the structures are of such heights that the levels of lights cannot be placed in identical horizontal planes, then the light units should be placed such that the center of the horizontal beam patterns do not face toward the adjacent structure. For example, structures situated north and south of each other should have the light units on both structures installed on a northwest/southeast and northeast/southwest orientation.

3. ***Three or More Adjacent Structures***. The treatment of a cluster of structures as an individual or a complex of structures will be determined by the FAA as the result of an aeronautical study, taking into consideration the location, heights, and spacing with other structures.

75. ANTENNA OR SIMILAR APPURTENANCE LIGHT

When a structure lighted by a high intensity flashing light system is topped with an antenna or similar appurtenance exceeding 40 feet (12m) in height, a medium intensity flashing white light (L-865) should be placed within 40 feet (12m) from the tip of the appurtenance. This light should operate 24 hours a day and flash simultaneously with the rest of the lighting system.

76. CHIMNEYS, FLARE STACKS, AND SIMILAR SOLID STRUCTURES

The number of light levels depends on the height of the structure excluding appurtenances. Three or more lights should be installed on each level in such a manner to ensure an unobstructed view by the pilot. Normally, the top level is on the highest point of a structure. However, the top level of chimney lights may be installed as low as 20 feet (6m) below the top to minimize deposit build-up due to emissions.

77. RADIO AND TELEVISION TOWERS AND SIMILAR SKELETAL STRUCTURES

a. ***Mounting Lights***. The number of levels recommended depends on the height of the structure, including antennas and similar appurtenances. At least three lights should be installed on each level and mounted to ensure that the effective intensity of the full horizontal beam coverage is not impaired by the structural members.

b. ***Top Level***. One level of lights should be installed at the highest point of the structure. If the highest point is a rod or antenna incapable of supporting a lighting system, then the top level of lights should be installed at the highest portion of the main skeletal structure. When guy wires come together at the top, it may be necessary to install this level of lights as low as 10 feet (3m) below the top. If the rod or antenna exceeds 40 feet (12m) above the main structure, a medium intensity flashing white light (L-865) should be mounted on the highest point. If the appurtenance (such as a whip antenna) is incapable of supporting a medium intensity light, one or more lights should be installed on a pole adjacent to the appurtenance. Adjacent installation should not exceed the height of the appurtenance and be within 40 feet (12m) of the top to allow an unobstructed view of at least one light.

c. ***Ice Shields***. Where icing is likely to occur, metal grates or similar protective ice shields should be installed directly over each light unit to prevent falling ice or accumulations from damaging the light units.

78. HYPERBOLIC COOLING TOWERS

Light units should be installed in a manner to ensure an unobstructed view of at least two lights by a pilot approaching from **any** direction.

a. ***Number of Light Units***. The number of units recommended depends on the diameter of the structure

at the top. The number of lights recommended in the following table are the minimum. When the structure diameter is:

1. *20 Feet (6m) or Less.* Three light units per level.

2. *Exceeding 20 Feet (6m) But Not More Than 100 Feet (31m).* Four light units per level.

3. *Exceeding 100 Feet (31m) But Not More Than 200 Feet (61m).* Six light units per level.

4. *Exceeding 200 Feet (61m).* Eight light units per level.

b. ***Structures Exceeding 600 Feet (183m) AGL***. Structures exceeding 600 feet (183m) AGL should have a second level of light units installed approximately at the midpoint of the structure and in a vertical line with the top level of lights.

79. PROMINENT BUILDINGS AND SIMILAR EXTENSIVE OBSTRUCTIONS

When objects within a group of obstructions are approximately the same overall height above the surface and are located not more than 150 feet (46m) apart, the group of obstructions may be considered an extensive obstruction. Install light units on the same horizontal plane at the highest portion or edge of prominent obstructions. Light units should be placed to ensure that the light is visible to a pilot approaching from **any** direction. These lights may require shielding, such as louvers, to ensure minimum adverse impact on local communities. Extreme caution in the use of high intensity flashing white lights should be exercised.

a. ***If the Obstruction is 200 feet (61m) or Less in Either Horizontal*** *Dimension*, install three or more light units at the highest portion of the structure in a manner to ensure that at least one light is visible to a pilot approaching from **any** direction. Units may be mounted on a single pedestal at or near the center of the obstruction. If light units are placed more than 10 feet (3m) from the center point of the structure, use a minimum of four units.

b. ***If the Obstruction Exceeds 200 Feet (61m) in One Horizontal Dimension***, but is 200 feet (61m) or less in the other, two light units should be placed on each of the shorter sides. These light units may either be installed adjacent to each other at the midpoint of the edge of the obstruction or at (near) each corner with the light unit aimed to provide 180 degrees of coverage at each edge. One or more light units should be installed along the overall length of the major axis. These lights should be installed at approximately equal intervals not to exceed a distance of 100 feet (31m) from the corners or from each other.

c. ***If the Obstruction Exceeds 200 Feet (61m) in Both Horizontal Dimensions***, light units should be equally spaced along the overall perimeter of the obstruction at intervals of 100 feet (31m) or fraction thereof.

CHAPTER 8. DUAL LIGHTING WITH RED/MEDIUM INTENSITY FLASHING WHITE SYSTEMS

80. PURPOSE

This dual lighting system includes red lights (L-864) for nighttime and medium intensity flashing white lights (L-865) for daytime and twilight use. This lighting system may be used in lieu of operating a medium intensity flashing white lighting system at night. There may be some populated areas where the use of medium intensity at night may cause significant environmental concerns. The use of the dual lighting system should reduce/mitigate those concerns. Recommendations on lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structutes and overall layout of design.

81. INSTALLATION

The light units should be installed as specified in the appropriate portions of Chapters 4, 5, and 6. The number of light levels needed may be obtained from Appendix 1.

82. OPERATION

Lighting systems should be operated as specified in Chapter 3. Both systems should not be operated at the same time; however, there should be no more than a 2-second delay when changing from one system to the other. Outage of one of two lamps in the uppermost red beacon (L-864 incandescent unit) or outage of any uppermost red light shall cause the white obstruction light system to operate in its specified ”night” step intensity.

83. CONTROL DEVICE

The light system is controlled by a device that changes the system when the ambient light changes. The system should automatically change steps when

the northern sky illumination in the Northern Hemisphere on a vertical surface is as follows:

a. ***Twilight-to-Night***. This should not occur before the illumination drops below 5 foot-candles (53.8 lux) but should occur before it drops below 2 foot-candles (21.5 lux).

b. ***Night-to-Day***. The intensity changes listed in subparagraph 83 a above should be reversed when changing from the night to day mode.

84. ANTENNA OR SIMILAR APPURTENANCE LIGHT

When a structure utilizing this dual lighting system is topped with an antenna or similar appurtenance exceeding 40 feet (12m) in height, a medium intensity flashing white (L-865) and a red flashing beacon (L-864) should be placed within 40 feet (12m) from the tip of the appurtenance. The white light should operate during daytime and twilight and the red light during nighttime. These lights should flash simultaneously with the rest of the lighting system.

85. OMISSION OF MARKING

When medium intensity white lights are operated on structures 500 feet (153m) AGL or less during daytime and twilight, other methods of marking may be omitted.

CHAPTER 9. DUAL LIGHTING WITH RED/HIGH INTENSITY FLASHING WHITE SYSTEMS

90. PURPOSE

This dual lighting system includes red lights (L-864) for nighttime and high intensity flashing white lights (L-856) for daytime and twilight use. This lighting system may be used in lieu of operating a flashing white lighting system at night. There may be some populated areas where the use of high intensity lights at night may cause significant environmental concerns and complaints. The use of the dual lighting system should reduce/mitigate those concerns. Recommendations on lighting structures can vary depending on terrain features, weather patterns, geographic location, and in the case of wind turbines, number of structutes and overall layout of design.

91. INSTALLATION

The light units should be installed as specified in the appropriate portions of Chapters 4, 5, and 7. The number of light levels needed may be obtained from Appendix 1.

92. OPERATION

Lighting systems should be operated as specified in Chapters 4, 5, and 7. Both systems should not be operated at the same time; however, there should be no more than a 2-second delay when changing from one system to the other. Outage of one of two lamps in the uppermost red beacon (L-864 incandescent unit) or outage of any uppermost red light shall cause the white obstruction light system to operate in its specified "night" step intensity.

93. CONTROL DEVICE

The light intensity is controlled by a device that changes the intensity when the ambient light changes. The system should automatically change intensity steps when the northern sky illumination in the Northern Hemisphere on a vertical surface is as follows:

a. ***Day-to-Twilight***. This should not occur before the illumination drops to 60 foot-candles (645.8 lux) but should occur before it drops below 35 foot-candles (376.7 lux). The illuminance-sensing device should, if practical, face the northern sky in the Northern Hemisphere.

b. ***Twilight-to-Night***. This should not occur before the illumination drops below 5 foot-candles (53.8 lux) but should occur before it drops below 2 foot-candles (21.5 lux).

c. ***Night-to-Day***. The intensity changes listed in subparagraph 93 a and b above should be reversed when changing from the night to day mode.

94. ANTENNA OR SIMILAR APPURTENANCE LIGHT

When a structure utilizing this dual lighting system is topped with an antenna or similar appurtenance exceeding 40 feet (12m) in height, a medium intensity flashing white light (L-865) and a red flashing beacon (L-864) should be placed within 40 feet (12m) from the tip of the appurtenance. The white light should operate during daytime and twilight and the red light during nighttime.

95. OMISSION OF MARKING

When high intensity white lights are operated during daytime and twilight, other methods of marking may be omitted.

CHAPTER 10. MARKING AND LIGHTING OF CATENARY AND CATENARY SUPPORT STRUCTURES

100. PURPOSE

This chapter provides guidelines for marking and lighting catenary and catenary support structures. The recommended marking and lighting of these structures is intended to provide day and night conspicuity and to assist pilots in identifying and avoiding catenary wires and associated support structures.

101. CATENARY MARKING STANDARDS

Lighted markers are available for increased night conspicuity of high-voltage (69KV or greater) transmission line catenary wires. These markers should be used on transmission line catenary wires near airports, heliports, across rivers, canyons, lakes, etc. The lighted markers should be manufacturer certified as recognizable from a minimum distance of 4,000 feet (1219m) under nighttime conditions, minimum VFR conditions or having a minimum intensity of at least 32.5 candela. The lighting unit should emit a steady burning red light. They should be used on the highest energized line. If the lighted markers are installed on a line other than the highest catenary, then markers specified in paragraph 34 should be used in addition to the lighted markers. (The maximum distance between the line energizing the lighted markers and the highest catenary above the lighted marker should be no more than 20 feet (6m).) Markers should be distinctively shaped, i.e., spherical, cylindrical, so they are not mistaken for items that are used to convey other information. They should be visible in all directions from which aircraft are likely to approach. The area in the immediate vicinity of the supporting structure's base should be clear of all items and/or objects of natural growth that could interfere with the line-of-sight between a pilot and the structure's lights. Where a catenary wire crossing requires three or more supporting structures, the inner structures should be equipped with enough light units per level to provide a full coverage.

a. ***Size and Color***. The diameter of the markers used on extensive catenary wires across canyons, lakes, rivers, etc., should be not less than 36 inches (91cm). Smaller 20-inch (51cm) markers are permitted on less extensive power lines or on power lines below 50 feet (15m) above the ground and within 1,500 feet (458m) of an airport runway end. Each marker should be a solid color such as aviation orange, white, or yellow.

b. ***Installation.***

1. ***Spacing.*** Lighted markers should be spaced equally along the wire at intervals of approximately 200 feet (61m) or a fraction thereof. Intervals between markers should be less in critical areas near runway ends, i.e., 30 to 50 feet (10m to 15m). If the markers are installed on a line other than the highest catenary, then markers specified in paragraph 34 should be used in addition to the lighted markers. The maximum distance between the line energizing the lighted markers and the highest catenary above the markers can be no more than 20 feet (6m). The lighted markers may be installed alternately along each wire if the distance between adjacent markers meets the spacing standard. This method allows the weight and wind loading factors to be distributed.

2. ***Pattern***. An alternating color scheme provides the most conspicuity against all backgrounds. Mark overhead wires by alternating solid colored markers of aviation orange, white, and yellow. Normally, an orange marker is placed at each end of a line and the spacing is adjusted (not to exceed 200 feet (61m)) to accommodate the rest of the markers. When less than four markers are used, they should all be aviation orange.

102. CATENARY LIGHTING STANDARDS

When using medium intensity flashing white (L-866), high intensity flashing white (L-857), dual medium intensity (L-866/L-885) or dual high intensity (L-857/885) lighting systems, operated 24 hours a day, other marking of the support structure is not necessary.

a. ***Levels***. A system of three levels of sequentially flashing light units should be installed on each supporting structure or adjacent terrain. Install one level at the top of the structure, one at the height of the lowest point in the catenary and one level approximately midway between the other two light levels. The middle level should normally be at least 50 feet (15m) from the other two levels. The middle light unit may be deleted when the distance between the top and the bottom light levels is less than 100 feet (30m).

1. ***Top Levels***. One or more lights should be installed at the top of the structure to provide 360-degree coverage ensuring an unobstructed view. If the installation presents a potential danger to maintenance personnel, or when necessary for lightning protection, the top level of lights may be mounted as low as 20 feet (6m) below the highest point of the structure.

2. ***Horizontal Coverage***. The light units at the middle level and bottom level should be installed so as to provide a minimum of 180-degree coverage centered perpendicular to the flyway. Where a catenary crossing is situated near a bend in a river, canyon, etc., or is not perpendicular to the flyway, the

horizontal beam should be directed to provide the most effective light coverage to warn pilots approaching from either direction of the catenary wires.

3. ***Variation.*** The vertical and horizontal arrangements of the lights may be subject to the structural limits of the towers and/or adjacent terrain. A tolerance of 20 percent from uniform spacing of the bottom and middle light is allowed. If the base of the supporting structure(s) is higher than the lowest point in the catenary, such as a canyon crossing, one or more lights should be installed on the adjacent terrain at the level of the lowest point in the span. These lights should be installed on the structure or terrain at the height of the lowest point in the catenary.

b. ***Flash Sequence***. The flash sequence should be middle, top, and bottom with all lights on the same level flashing simultaneously. The time delay between flashes of levels is designed to present a unique system display. The time delay between the start of each level of flash duration is outlined in FAA AC 150/5345-43, Specification for Obstruction Lighting Equipment.

c. ***Synchronization***. Although desirable, the corresponding light levels on associated supporting towers of a catenary crossing need not flash simultaneously.

d. ***Structures 500 feet (153m) AGL or Less***. When medium intensity white lights (L-866) are operated 24 hours a day, or when a dual red/medium intensity system (L-866 daytime & twilight/L-885 nighttime) is used, marking can be omitted. When using a medium intensity while light (L-866) or a flashing red light (L-885) during twilight or nighttime only, painting should be used for daytime marking.

e. *Structures Exceeding 500 Feet (153m) AGL.* When high intensity white lights (L-857) are operated 24 hours a day, or when a dual red/high intensity system (L-857 daytime and twilight/L-885 nighttime) is used, marking can be omitted. This system should not be recommended on structures 500 feet (153m) or less unless an FAA aeronautical study shows otherwise. When a flashing red obstruction light (L-885), a medium intensity (L-866) flashing white lighting system or a high intensity white lighting system (L-857) is used for nighttime and twilight only, painting should be used for daytime marking.

103. CONTROL DEVICE

The light intensity is controlled by a device (photocell) that changes the intensity when the ambient light changes. The lighting system should automatically change intensity steps when the northern sky illumination in the Northern Hemisphere on a vertical surface is as follows:

a. ***Day-to-Twilight (L-857 System)***. This should not occur before the illumination drops to 60 foot-candles (645.8 lux), but should occur before it drops below 35 foot-candles (376.7 lux). The illuminant-sensing device should, if practical, face the northern sky in the Northern Hemisphere.

b. ***Twilight-to-Night (L-857 System).*** This should not occur before the illumination drops below 5 foot-candles (53.8 lux), but should occur before it drops below 2 foot-candles (21.5 lux).

c. ***Night-to-Day***. The intensity changes listed in subparagraph 103 a. and b. above should be reversed when changing from the night to day mode.

d. ***Day-to-Night (L-866 or L-885/L-866).*** This should not occur before the illumination drops below 5 foot-candles (563.8 lux) but should occur before it drops below 2 foot-candles (21.5 lux).

e. ***Night-to-Day***. The intensity changes listed in subparagraph d. above should be reversed when changing from the night to day mode.

f. ***Red Obstruction (L-885).*** The red lights should not turn on until the illumination drops below 60 foot-candles (645.8 lux) but should occur before reaching a level of 35 foot-candles (367.7 lux). Lights should not turn off before the illuminance rises above 35 foot-candles (367.7 lux), but should occur before reaching 60 foot-candles (645.8 lux).

104. AREA SURROUNDING CATENARY SUPPORT STRUCTURES

The area in the immediate vicinity of the supporting structure's base should be clear of all items and/or objects of natural growth that could interfere with the line-of-sight between a pilot and the structure's lights.

105. THREE OR MORE CATENARY SUPPORT STRUCTURES

Where a catenary wire crossing requires three or more supporting structures, the inner structures should be equipped with enough light units per level to provide a full 360-degree coverage.

CHAPTER 11. MARKING AND LIGHTING MOORED BALLOONS AND KITES

110. PURPOSE

The purpose of marking and lighting moored balloons, kites, and their cables or mooring lines is to indicate the presence and general definition of these objects to pilots when converging from any normal angle of approach.

111. STANDARDS

These marking and lighting standards pertain to all moored balloons and kites that require marking and lighting under 14 CFR, part 101.

112. MARKING

Flag markers should be used on mooring lines to warn pilots of their presence during daylight hours.

a. ***Display.*** Markers should be displayed at no more than 50-foot (15m) intervals and should be visible for at least 1 statute mile.

b. ***Shape.*** Markers should be rectangular in shape and not less than 2 feet (0.6m) on a side. Stiffeners should be used in the borders so as to expose a large area, prevent drooping in calm wind, or wrapping around the cable.

c. ***Color Patterns***. One of the following color patterns should be used:

1. ***Solid Color***. Aviation orange.

2. ***Orange and White.*** Two triangular sections, one of aviation orange and the other white, combined to form a rectangle.

113. PURPOSE

Flashing obstruction lights should be used on moored balloons or kites and their mooring lines to warn pilots of their presence during the hours between sunset and sunrise and during periods of reduced visibility. These lights may be operated 24 hours a day.

a. ***Systems***. Flashing red (L-864) or white beacons (L-865) may be used to light moored balloons or kites. High intensity lights (L-856) are not recommended.

b. ***Display***. Flashing lights should be displayed on the top, nose section, tail section, and on the tether cable approximately 15 feet (4.6m) below the craft so as to define the extremes of size and shape. Additional lights should be equally spaced along the cable's overall length for each 350 feet (107m) or fraction thereof.

c. ***Exceptions.*** When the requirements of this paragraph cannot be met, floodlighting may be used.

114. OPERATIONAL CHARACTERISTICS

The light intensity is controlled by a device that changes the intensity when the ambient light changes. The system should automatically turn the lights on and change intensities as ambient light condition change. The reverse order should apply in changing from nighttime to daytime operation. The lights should flash simultaneously.

CHAPTER 12. MARKING AND LIGHTING EQUIPMENT AND INFORMATION

120. PURPOSE

This chapter lists documents relating to obstruction marking and lighting systems and where they may be obtained.

121. PAINT STANDARD

Paint and aviation colors/gloss, referred to in this publication should conform to Federal Standard FED-STD-595. Approved colors shall be formulated without the use of Lead, Zinc Chromate or other heavy metals to match International Orange, White and Yellow. All coatings shall be manufactured and labeled to meet Federal Environmental Protection Act Volatile Organic Compound(s) guidelines, including the National Volatile Organic Compound Emission Standards for architectural coatings.

a. **Exterior Acrylic Waterborne Paint.** Coating should be a ready mixed, 100% acrylic, exterior latex formulated for application directly to galvanized surfaces. Ferrous iron and steel or non-galvanized surfaces shall be primed with a manufacturer recommended primer compatible with the finish coat.

b. **Exterior Solventborne Alkyd Based Paint**. Coating should be ready mixed, alkyd-based, exterior enamel for application directly to non-galvanized surfaces such as ferrous iron and steel. Galvanized surfaces shall be primed with a manufacturer primer compatible with the finish coat.

Paint Standards Color Table

COLOR	NUMBER
Orange	12197
White	17875
Yellow	13538

TBL 3

Note-
1. Federal specification T1-P-59, aviation surface paint, ready mixed international orange.

2. Federal specification T1-102, aviation surface paint, oil titanium zinc.

3. Federal specification T1-102, aviation surface paint, oil, exterior, ready mixed, white and light tints.

122. AVAILABILITY OF SPECIFICATIONS

Federal specifications describing the technical characteristics of various paints and their application techniques may be obtained from:

GSA- Specification Branch
470 L'Enfant Plaza
Suite 8214
Washington, DC 20407
Telephone: (202) 619-8925

123. LIGHTS AND ASSOCIATED EQUIPMENT

The lighting equipment referred to in this publication should conform to the latest edition of one of the following specifications, as applicable:

a. ***Obstruction Lighting Equipment.***

1. AC 150/5345-43, FAA Specification for Obstruction Lighting Equipment.

2. Military Specifications MIL-L-6273, Light, Navigational, Beacon, Obstacle or Code, Type G-1.

3. Military Specifications MIL-L-7830, Light Assembly, Markers, Aircraft Obstruction.

b. ***Certified Equipment.***

1. AC 150/5345-53, Airport Lighting Certification Program, lists the manufacturers that have demonstrated compliance with the specification requirements of AC 150/5345-43.

2. Other manufacturers' equipment may be used provided that equipment meets the specification requirements of AC 150/5345-43.

c. ***Airport Lighting Installation and Maintenance.***

1. AC 150/5340-21, Airport Miscellaneous Lighting Visual Aids, provides guidance for the installation, maintenance, testing, and inspection of obstruction lighting for airport visual aids such as airport beacons, wind cones, etc.

2. AC 150/5340-26, Maintenance of Airport Visual Aid Facilities, provides guidance on the maintenance of airport visual aid facilities.

d. ***Vehicles.***

1. AC 150/5210-5, Painting, Marking, and Lighting of Vehicles Used on an Airport, contains provisions for marking vehicles principally used on airports.

2. FAA Facilities**.** Obstruction marking for FAA facilities shall conform to FAA Drawing Number D-5480, referenced in FAA Standard FAA-STD-003, Paint Systems for Structures.

CHAPTER 13. MARKING AND LIGHTING WIND TURBINE FARMS

130. PURPOSE

This chapter provides guidelines for the marking and lighting of wind turbine farms. For the purposes of this advisory circular, wind turbine farms are defined as a wind turbine development that contains more than three (3) turbines of heights over 200 feet above ground level. The recommended marking and lighting of these structures is intended to provide day and night conspicuity and to assist pilots in identifying and avoiding these obstacles.

131. GENERAL STANDARDS

The development of wind turbine farms is a very dynamic process, which constantly changes based on the differing terrain they are built on. Each wind turbine farm is unique; therefore it is important to work closely with the sponsor to determine a lighting scheme that provides for the safety of air traffic. The following are guidelines that are recommended for wind turbine farms. Consider the proximity to airports and VFR routes, extreme terrain where heights may widely vary, and local flight activity when making the recommendation.

a. Not all wind turbine units within an installation or farm need to be lighted. Definition of the periphery of the installation is essential; however, lighting of interior wind turbines is of lesser importance unless they are taller than the peripheral units.

b. Obstruction lights within a group of wind turbines should have unlighted separations or gaps of no more than ½ statute mile if the integrity of the group appearance is to be maintained. This is especially critical if the arrangement of objects is essentially linear.

c. Any array of flashing or pulsed obstruction lighting should be synchronized or flash simultaneously.

d. Nighttime wind turbine obstruction lighting should consist of the preferred FAA L-864 aviation red-colored flashing lights.

e. White strobe fixtures (FAA L-865) may be used in lieu of the preferred L-864 red flashing lights, but must be used alone without any red lights, and must be positioned in the same manner as the red flashing lights.

f. The white paint most often found on wind turbine units is the most effective daytime early warning device. Other colors, such as light gray or blue, appear to be significantly less effective in providing daytime warning. Daytime lighting of wind turbine farms is not required, as long as the turbine structures are painted in a bright white color or light off-white color most often found on wind turbines.

132. WIND TURBINE CONFIGURATIONS – Prior to recommending marking and lighting, determine the configuration and the terrain of the wind turbine farm. The following is a description of the most common configurations.

a. Linear – wind turbine farms in a line-like arrangement, often located along a ridge line, the face of a mountain or along borders of a mesa or field. The line may be ragged in shape or be periodically broke, and may vary in size from just a few turbines up to 20 miles long.

b. Cluster – turbine farms where the turbines are placed in circles like groups on top of a mesa, or within a large field. A cluster is typically characterized by having a pronounced perimeter, with various turbines placed inside the circle at various, erratic distances throughout the center of the circle.

c. Grid – turbine farms arranged in a geographical shape such as a square or a rectangle, where each turbine is set a consistent distance from each other in rows, giving the appearance that they are part of a square like pattern.

133. MARKING STANDARDS

The bright white or light off-white paint most often found on wind turbines has been shown to be most effective, and if used, no lights are required during the daytime. However, if darker paint is used, wind turbine marking should be supplemented with daytime lighting, as required.

134. LIGHTING STANDARDS

a. Flashing red (L864), or white (L-865) lights may be used to light wind turbines. Studies have shown that red lights are most effective, and should be the first consideration for lighting recommendations of wind turbines.

b. Obstruction lights should have unlighted separations or gaps of no more than ½ mile. Lights should flash simultaneously. Should the synchronization of the lighting system fail, a lighting outage report should be made in accordance with paragraph 23 of this advisory circular. Light fixtures should be placed as high as possible on the turbine nacelle, so as to be visible from 360 degrees.

c. Linear Turbine Configuration. Place a light on each turbine positioned at each end of the line or string of turbines. Lights should be no more than ½ statute mile, or 2640 feet from the last lit turbine. In the event the last segment is significantly short, push the lit turbines back towards the starting point to present a well balanced string of lights. High concentrations of lights should be avoided.

d. Cluster Turbine Configuration. Select a starting point among the outer perimeter of the cluster. This turbine should be lit, and a light should be placed on the next turbine so that no more than a ½ statute mile gap exists. Continue this pattern around the perimeter. If the distance across the cluster is greater than 1 mile, and/or the terrain varies by more than 100 feet, place one or more lit turbines at locations throughout the center of the cluster.

e. Grid Turbine Configuration. Select each of the defined corners of the layout to be lit, and then utilize the same concept of the cluster configuration as outlined in paragraph d.

f. Special Considerations. On occasion, one or two turbines may be located apart from the main grouping of turbines. If one or two turbines protrude from the general limits of the turbine farm, these turbines should be lit.

APPENDIX 1: Specifications for Obstruction Lighting Equipment Classification

APPENDIX

Type	Description
L-810	Steady-burning Red Obstruction Light
L-856	High Intensity Flashing White Obstruction Light (40 FPM)
L-857	High Intensity Flashing White Obstruction Light (60 FPM)
L-864	Flashing Red Obstruction Light (20-40 FPM)
L-865	Medium Intensity Flashing White Obstruction Light (40-FPM)
L-866	Medium Intensity Flashing White Obstruction Light (60-FPM)
L-864/L-865	Dual: Flashing Red Obstruction Light (20-40 FPM) and Medium Intensity Flashing White Obstruction Light (40 FPM)
L-885	Red Catenary 60 FPM
FPM = Flashes Per Minute

APPENDIX 2. Miscellaneous

1. RATIONALE FOR OBSTRUCTION LIGHT INTENSITIES.

Sections 91.117, 91.119 and 91.155 of the FAR Part 91, General Operating and Flight Rules, prescribe aircraft speed restrictions, minimum safe altitudes, and basic visual flight rules (VFR) weather minimums for governing the operation of aircraft, including helicopters, within the United States.

2. DISTANCE VERSUS INTENSITIES.

TBL 5 depicts the distance the various intensities can be seen under 1 and 3 statute miles meteorological visibilities:

Distance/Intensity Table

Time Period	*Meteorological Visibility Statute Miles*	*Distance Statute Miles*	*Intensity Candelas*
Night		**2.9 (4.7km)**	**1,500 (+/- 25%)**
	3 (4.8km)	**3.1 (4.9km)**	**2,000 (+/- 25%)**
		1.4 (2.2km)	**32**
Day		**1.5 (2.4km)**	**200,000**
	1 (1.6km)	**1.4 (2.2km)**	**100,000**
		1.0 (1.6km)	**20,000 (+/- 25%)**
Day		**3.0 (4.8km)**	**200,000**
	3 (4.8km)	**2.7 (4.3km)**	**100,000**
		1.8 (2.9km)	**20,000 (+/- 25%)**
Twilight	**1 (1.6km)**	**1.0 (1.6km) to 1.5 (2.4km)**	**20,000 (+/- 25%)**?
Twilight	**3 (4.8km)**	**1.8 (2.9km) to 4.2 (6.7km)**	**20,000 (+/- 25%)**?

Note-
1. DISTANCE CALCULATED FOR NORTH SKY ILLUMINANCE.

TBL 5

3. CONCLUSION.

Pilots of aircraft travelling at 165 knots (190 mph/306kph) or less should be able to see obstruction lights in sufficient time to avoid the structure by at least 2,000 feet (610m) horizontally under all conditions of operation, provided the pilot is operating in accordance with FAR Part 91. Pilots operating between 165 knots (190 mph/303 km/h) and 250 knots (288 mph/463 kph) should be able to see the obstruction lights unless the weather deteriorates to 3 statute miles (4.8 kilometers) visibility at night, during which time period 2,000 candelas would be required to see the lights at 1.2 statute miles (1.9km). A higher intensity, with 3 statute miles (4.8 kilometers) visibility at night, could generate a residential annoyance factor. In addition, aircraft in these speed ranges can normally be expected to operate under instrument flight rules (IFR) at night when the visibility is 1 statute mile (1.6 kilometers).

4. DEFINITIONS.

a. Flight Visibility. The average forward horizontal distance, from the cockpit of an aircraft in flight, at which prominent unlighted objects may be seen and identified by day and prominent lighted objects may be seen and identified by night.

Reference-
AIRMAN'S INFORMATION MANUAL
PILOT/CONTROLLER GLOSSARY.

b. Meteorological Visibility. A term that denotes the greatest distance, expressed in statute miles, that selected objects (visibility markers) or lights of moderate intensity (25 candelas) can be seen and identified under specified conditions of observation.

5. LIGHTING SYSTEM CONFIGURATION.

a. *Configuration A.* Red lighting system.

b. *Configuration B.* High Intensity White Obstruction Lights (including appurtenance lighting).

c. *Configuration C.* Dual Lighting System - High Intensity White & Red (including appurtenance lighting).

d. *Configuration D.* Medium Intensity White Lights (including appurtenance lighting).

e. *Configuration E.* Dual Lighting Systems - Medium Intensity White & Red (including appurtenance lighting).

Example-
''CONFIGURATION B 3'' DENOTES A HIGH INTENSITY LIGHTING SYSTEM WITH THREE LEVELS OF LIGHT.

APPENDIX L SPECIAL STATUS PLANT AND ANIMAL SPECIES AND SCIENTIFIC NAMES

State Listed *Special Status Species with Potential to Occur Under the Proposed Airspace and Their Counties of Occurrence (Page 1 of 9)

Common Name	Scientific Name	Project Area States and Counties				Protection Status	Habitat
		ND	SD	MT	WY		
Birds							
American bittern	*Botaurus lentiginosus*	All Counties		Carter	Crook	MT S3[1]	Seasonal or semi-permanent wetlands
American dipper	*Cinclus mexicanus*		Lawrence, Meade		Sheridan		Fast, clear, cold mountain streams
American white pelican	*Pelicanus erythrorhynchos*					MT S3[1]	Lakes, marshes, Rivers, reservoirs
Baird's sparrow	*Ammodramus bairdii*	Bowman			Campbell	MT S3[1], S[2]	Native mixed-grass prairie
Bald eagle	*Heliaetus leucocephalus*	All Counties (migrant)	Lawrence, Meade, Ziebach	All Counties (migrant)	Sheridan, Campbell	ND E[1], SD T[1]	Riparian and lacustrine
Black-backed woodpecker	*Picoides arcticus*			Powder River	Crook, Westin	MT S3[1], S[2], S[3]	Early successional burned forest of mixed conifer
Black-billed cuckoo	*Coccyzus erythropthalmus*	All Counties		Big Horn, Fallon	Crook, Campbell, Sheridan	MT S3[1]	Woodlands, thickets, prairie shrubs, wooded urban areas
Black tern	*Chlidonias niger*			Carter		MT S3[1], S[2]	Wetlands, marshes, small ponds
Burrowing owl	*Speotyto cunicularia*			All Counties	All Counties	MT S3[1], ND SOC[1] , S[2] S[3]	Open grasslands, associated with animal burrows
Common loon	*Gavia immer*				Crook, Sheridan	MT S3[1]	Clear, secluded mid-elevational lakes >4 acres

State Listed *Special Status Species with Potential to Occur Under the Proposed Airspace and Their Counties of Occurrence (Page 2 of 9)

Common Name	Scientific Name	Project Area States and Counties				Protection Status	Habitat
		ND	SD	MT	WY		
Ferruginous hawk	*Buteo regalis*	All Counties		Carter, Custer, Fallon, Powder River, Rosebud	All Counties	ND SOC[1], MT S3[1],S[2]	Native grasslands and shrublands
Grasshopper sparrow	*Ammodramus savannarum*		All Counties		All Counties	WY S3[1], SD S4[1]	Lightly-grazed mixed-grass prairie, meadows, hayfields
Horned grebe	*Podiceps auritus*			Passage migrant		MT S3[1]	large sized bodies of water, including rivers and small lakes
Lark bunting	*Calamospiza melanocorys*	All Counties				MT S4[1]	Sagebrush/sage prairie, secondary mixed-grass with dispersed shrubs
Long-billed curlew	*Numenius americanus*	Golden Valley, Bowman, Sioux, Slope		All Counties	Campbell, Crook, Sheridan, Westin	MT S3[1], S[2]	Short-grass prairie or grazed mixed-grass
Marbled godwit	*Limosa fedoa*	All Counties (migrant)				ND SOC[1]	Wetlands, streams, lakes, native prairie often heavily grazed
Mountain plover	*Charadrius montanus*			Big Horn, Treasure	Campbell, Crook, Westin	MT S3[1], S[2]	Prairie dog colonies, shortgrass prairies
Northern goshawk	*Accipiter gentilis*	All Counties (winter range)	Black Hills area	Carter, Powder River, Rosebud	Crook, Sheridan	ND SOC[1], MT S3[1], S[2]	Coniferous and aspen forests in mid-altitudes
Osprey	*Pandion haliaetus*		Lawrence		All Counties	SD T[1]	Near large rivers and lakes
Swainson's hawk	*Buteo swainsoni*	All Counties				ND SOC[1],SD SOC[1]	prairies

State Listed *Special Status Species with Potential to Occur Under the Proposed Airspace and Their Counties of Occurrence (Page 3 of 9)

Common Name	Scientific Name	Project Area States and Counties				Protection Status	Habitat

***Note**: Special Status Species are species that have some legal or policy protections in place (whether by state resource agencies or federal entities such as the BLM or USFS), but are not listed or proposed for protection under the Endangered Species Act.

C=candidate; D=delisted; E=endangered; PE = Proposed Endangered; HS=highly safeguarded; LE= listed endangered; LT= listed threatened; T=threatened; PT=proposed threatened; S=sensitive; SOC=species of concern; SR=salvage restricted; WSC=wildlife of special concern; XN= Experimental Nonessential population; M = Monitored

Values and their definitions:

State rank characterizes the relative rarity or endangerment within the state of Washington. Factors including, but not limited to, number of known occurrences are considered when assigning a rank. Two codes together represent an inexact range (e.g., S1S2) or different ranks for breeding and non-breeding populations (e.g., S1B, S3N).

S1 = Critically imperiled in the state because of extreme rarity or other factors making it especially vulnerable to extirpation from the state. (Typically 5 or fewer occurrences or very few remaining individuals or acres)

S2 = Imperiled in the state because of rarity or other factors making it very vulnerable to extirpation from the state. (Typically 6 to 20 occurrences or few remaining individuals or acres)

S3 = Rare or uncommon in the state. (Typically 21 to 100 occurrences)

S4 = Widespread, abundant, and apparently secure in state, with many occurrences, but the taxon is of long-term concern. (Usually more than 100 occurrences)

S5 = Demonstrably widespread, abundant, and secure in the state; believed to be ineradicable under present conditions.

SH = Historical occurrences only are known, perhaps not verified in the past 20 years, but the taxon is suspected to still exist in the state.

SP = Potential for occurrence of the taxon in the state but no occurrences have been reported.

SR = Reported in the state but without persuasive documentation which would provide a basis for either accepting or rejecting the report (e.g., misidentified specimen).

SRF = Reported falsely in the state but the error persists in the literature.

SU = Uncertain. Possibly in peril in the state, but status is uncertain. More information is need.

SX = Believed to be extirpated from the state with little likelihood that it will be rediscovered.

S? = Not yet ranked. Sufficient time and effort have not yet been devoted to ranking of this taxon.

APPENDIX M
LETTERS OF AGREEMENT

This page intentionally left blank.

Denver Air Route Traffic Control Center/Salt Lake City Air Route Traffic Control Center/ 28th Bomb Wing, Ellsworth AFB

LETTER OF AGREEMENT

Effective: December 10, 2006

SUBJECT: POWDER RIVER TRAINING COMPLEX AND CROSSBOW ATCAA

1. PURPOSE: This Letter of Agreement defines areas, responsibilities, and procedures for the Powder River "A" and "B" Military Operations Areas (MOA), the Powder River Air Traffic Control Assigned Airspace (ATCAA), the Gateway ATCAA, the Black Hills ATCAA, and the Crossbow ATCAA, among Denver Air Route Traffic Control Center (Center), Salt Lake City Air Route Traffic Control Center (Center), and the 28th Bomb Wing, Ellsworth Air Force Base, South Dakota.

2. BACKGROUND: The 28th Bomb Wing (28 BW) has the operational requirement to perform high and low altitude training with, and without, support from the Belle Fourche Electronic Scoring Site located within the Powder River Training (PRT) Complex. Composite and multi-force exercises are also performed in the PRT Complex. The Crossbow ATCAA airspace redesign was developed to allow training aircraft to use only a small block of airspace needed for the exercise. It is not intended for use of large altitude blocks.

3. CANCELLATION: This agreement cancels the Letter of Agreement (LOA) among Denver Center, Salt Lake City Center, and the 28th Bomb Wing, Powder River Training Complex and Crossbow ATCAA, dated June 12, 2005.

4. SCOPE:

a. The provisions of this agreement are applicable to Denver Center, Salt Lake City Center, and the 28 BW and are supplemental to FAA Order 7610.4, Special Military Operations, and FAA Order 7110.65, Air Traffic Control, and appropriate military regulations. The provisions of this agreement may be canceled or amended by any one signatory notifying the others through written coordination.

b. The MOAs and ATCAAs are depicted in Attachments 1 through 4. The altitudes designated are described as follows:

(1) Powder River “A” MOA – Surface up to, but not including, FL180.

(2) Powder River “B” MOA – 1,000 feet AGL up to, but not including, FL180.

(3) Powder River ATCAA – FL180 to FL260 inclusive, or as assigned.

(4) Gateway ATCAA – FL180 to FL260 inclusive, or as assigned.

(5) Black Hills ATCAA – FL200 to FL230 inclusive.

(6) Crossbow ATCAA – FL270 to FL450 inclusive, or as assigned. (See paragraph 6b(7) for non-usable times and intended use of airspace.)

c. The Powder River "A" MOA, Powder River "B" MOA, Powder River ATCAA, Gateway ATCAA, and Black Hills ATCAA are all parts of the PRT Complex. Reference to the PRT Complex may include any one area or combinations of areas. The Crossbow ATCAA is not part of the PRT Complex.

5. RESPONSIBILITIES:

a. The 28 BW shall:

(1) Be the scheduling agency.

(2) Be responsible for the overall airspace management of the airspace within the complex.

(3) Ensure that all participating aircrews are familiar with and adhere to the provisions of this agreement.

b. Salt Lake City Center is the controlling agency for the Powder River "A" MOA.

c. Denver Center is the controlling agency for:

(1) Powder River "B" MOA.

(2) Powder River ATCAA.

(3) Gateway ATCAA.

(4) Black Hills ATCAA.

(5) Crossbow ATCAA.

6. PROCEDURES: Unless otherwise coordinated:

a. Time Conversion. The symbol ‡ indicates that during periods of Daylight Savings Time, effective hours will be 1 hour earlier than shown.

b. Airspace Coordination.

(1) The 28 BW shall ensure that the Denver Center Military Coordinator (MC) and the Salt Lake City Center MC receive the daily schedule for the planned activity in the PRT Complex and/or the Crossbow ATCAA by 2200Z‡ (1500 local), the day prior, for the next 24-hour period that starts at 0700Z‡ (0000 local). All changes and/or modifications to the schedule shall be coordinated at least 2 hours in advance.

(2) Only the airspace, time period, and altitude blocks needed to accomplish the desired maneuvers shall be requested.

(3) When cleared to operate in the Crossbow ATCAA at and above FL270, aircrews shall maintain a listening watch on Denver Center frequency 133.67/322.5. Should it become necessary for Denver Center or Salt Lake City Center to recall the airspace at and above FL270, it is expected that the aircrews will be able to return the airspace within a maximum of 30 minutes.

NOTE: Salt Lake City Center should coordinate with Denver Center MC position for recall of airspace at and above FL270.

(4) The 28 BW airspace manager shall provide Denver Center and Salt Lake City Center a current telephone list of personnel to contact in the event either Center must recall or restrict the use of scheduled airspace. If either Center recalls or restricts the use of scheduled airspace, they shall inform the other Center as soon as practicable.

(5) The Powder River "A" and "B" MOAs shall be scheduled simultaneously, not separately.

(6) "Time of Use" for the Powder River "A" and "B" MOAs are "Intermittent by NOTAM."

(7) The Crossbow ATCAA is not usable at and above FL270 between 1500-1800Z‡ (0800-1100 local) and 2130-2330Z‡ (1430-1630 local) daily. The airspace will be given in block altitudes of 1000 feet per aircraft (i.e., A flight of two aircraft will generally be approved for a 2000 foot block). When a climb from lower altitude is required within the lateral confines of the ATCAA, an expanded block may be temporarily granted by the controller until the formation is established within the requested block.

(8) Scheduling of the Powder River MOAs are predicated on the procedures in paragraph 6b(1) and (4); however, the areas are not released to the user until the pilot(s) have received a clearance into the area by Denver Center or Salt Lake City Center.

NOTE: If an aircraft is scheduled to enter the Powder River MOAs via a Military Training Route (MTR), the pilot shall request clearance into the MTR and the Powder River MOA simultaneously. Entry into the Powder River MOA is not automatic with the MTR clearance.

(9) The Black Hills ATCAA will only be used for marshalling or aerial refueling for multi-force exercises, in conjunction with the remaining PRT Complex airspace, with at least 3 administrative working days notification to Denver Center.

(10) For aircraft other than on an MTR, each FAA facility is responsible for notifying the other facility whenever participating aircraft have requested entry into the PRT Complex or Crossbow ATCAA. This can be accomplished through the facilities' operations supervisors or from controller to controller.

(11) Denver Center:

For aircraft entering PRT Complex area(s) from RAP308069 (ARCOT) or from RAP326036:

(a) Sector 31 shall coordinate activation, changes of assigned altitude blocks, and deactivation of the PRT Complex area(s) with Salt Lake City Center Sector 17 and the adjacent Minneapolis Center Sector(s), and when appropriate, Sectors 22 and 32.

(b) Sector 32 shall coordinate activation, changes of assigned altitude blocks, and deactivation of the Crossbow ATCAA with Salt Lake City Center Sector 17 and the adjacent Minneapolis Center Sector(s).

(12) Salt Lake City Center:

For aircraft entering PRT Complex area(s) from MLS146037:

(a) Sector 17 shall coordinate activation, changes of assigned altitude blocks, and deactivation of the PRT Complex area(s) with Denver Center Sectors 22 and 31 and the adjacent Minneapolis Center Sector(s), and when appropriate, Denver Center Sector 32.

(b) Sector 17 shall coordinate with Denver Center Sectors 22 and 31 prior to approving altitude changes within the PRT Complex, and with Denver Center Sector 32 prior to approving altitude changes within the Crossbow ATCAA, and shall advise the adjacent Minneapolis Center sector(s) of any altitude changes.

(13) When Denver Center and or Salt Lake City Center grant approval for operations in the Powder River MOAs, air traffic control (ATC) responsibility does not include Class G airspace. The Aeronautical Information Manual, Chapter 3, Section 4, defines ATC and VFR/IFR pilot responsibilities within MOAs.

c. Flight Planning and En Route Procedures.

(1) Flights shall enter the MOAs at 16,000 feet MSL using the standard entry point (ARCOT) when utilizing only the MOAs or when entering below FL180. When entering at or above FL180, flights shall enter within the scheduled ATCAA altitude block.

(2) Two navigation fixes, MLS119074 (LIBON) and RAP301089 (PLAAT), are required as a minimum when flight planning into the PRT Complex and/or the Crossbow ATCAA so that Denver Center and Salt Lake City Center receive proper flight plan information. Two unnamed fix/radial distances and four named fixes have been associated with Fix/Radial/Distance to simplify internal flight planning (see Attachment 2, Powder River ATCAA and Attachment 3, Crossbow ATCAA). They are identified as:

(a) ARCOT	RAP308069	(44° 51.9' - 104° 01.8') – standard entry fix
(b) LIBON	MLS119074	(45° 31.1' - 104° 41.5') – navigation fix
(c) PLAAT	RAP301089	(44° 59.8' - 104° 31.0') – navigation fix
(d) DRAGG	RAP295077	(44° 45.5' - 104° 25.9') – standard exit fix
(e)	RAP326036	(44° 32.0' - 103° 19.0') – southeast entry/exit fix
(f)	MLS146037	(45° 48.0' - 105° 40.0') – northwest entry/exit fix

(3) The aircraft shall file using the following format at a minimum (entry to exit): ..ARCOT..LIBON..PLAAT/D(hr)+(min)..DRAGG.. Other entry and exit fixes may be used prior to and after this required format.

Example:
..MLS146037..ARCOT..LIBON..PLAAT/D(hr)+(min)..DRAGG..RAP326036..

(4) Flight plan "Remarks" should include the airspace, entry and exit times, and MARSA, if appropriate.

(5) It shall be the responsibility of each pilot cleared to operate in the addressed airspace to remain within the confines of the airspace and to remain on the assigned Denver Center or Salt Lake City Center frequency unless approved to change frequency for a specified period of time. Radio communications are severely reduced below 16,000 feet MSL in the Powder River area.

NOTE: See Attachment 5 for communications frequencies of interest for the PRT Complex and the Crossbow ATCAA.

(6) Military Authority Assumes Responsibility for Separation of Aircraft (MARSA) shall apply between participating aircraft while operating in the PRT Complex and the Crossbow ATCAA and aircraft operating on MTRs that traverse the MOAs.

(7) Pilots shall use the current Rapid City, South Dakota, altimeter setting while operating below FL180 and an altimeter setting of 29.92 while operating at and above FL180 within the MOAs/ATCAAs. The altimeter setting shall be issued to participating aircraft as part of the clearance into the Powder River MOAs.

(8) All aircraft proposing to use the defined airspace shall have an operating transponder. The lead aircraft of formation flights shall remain on the assigned discrete beacon code. While operating within the PRT Complex and the Crossbow ATCAA, wingmen not previously assigned a discrete beacon code shall squawk code 4000 after formation breakup. After the aircraft have joined up in formation, and prior to exiting the airspace, wingmen shall squawk standby.

(9) Unless otherwise coordinated, pilots shall operate into and out of the PRT Complex on an IFR flight plan. Aircraft requesting to depart the airspace VFR are responsible for notifying either Denver Center or Salt Lake City Center, as appropriate.

(10) Stereo flight routes are available for local sorties from Ellsworth AFB.

(a) PRT1: RCA..RAP110060..ARCOT..LIBON..PLAAT/D1+00..DRAGG..RCA

d. Exit Procedures.

(1) Aircraft on an MTR shall exit the Powder River area at the expiration of the filed delay time and at an altitude within the published vertical limits of the MTR.

(2) Aircrews should inform ATC of their exit time at least 10 minutes prior to exiting the airspace. All aircraft shall remain within the PRT Complex or the Crossbow ATCAA until an IFR clearance to exit the airspace has been issued by either Denver Center or Salt Lake City Center.

(3) Use of the standard exit point (DRAGG) at 17,000 MSL is expected for aircraft returning directly to Ellsworth AFB; however, the other entry/exit fixes may be used in Class A for flights with follow-on activities or desiring a high approach into Ellsworth.

(4) Pilots shall, when requesting to exit the Powder River MOAs/ATCAA, contact Denver Center on 127.95 or 338.2 MHz, at or below FL260. When exiting the Crossbow ATCAA at and above FL270, pilots shall contact Denver Center on 133.67 or 322.4 MHz. Pilots shall, when exiting the Powder River MOAs/ATCAA at the MLS146037 fix (northwest exit fix), contact Salt Lake City Center on 126.85 or 305.2 MHz.

(5) If there is no contact with Denver Center on frequency 127.95 or 338.2 MHz, attempt contact with Denver Center on 135.6 or 363.02 MHz or Salt Lake City Center on 364.8 MHz (Tactical).

(6) The PRT Complex and Crossbow ATCAA area airspaces are automatically released back to the controlling agencies when the last aircraft has exited the airspace.

7. LOST COMMUNICATIONS:

a. If radio failure occurs before a delay clearance in the PRT Complex or the Crossbow ATCAA is received, follow the procedures specified in CFR part 91.185 and the DOD Flight Information Handbook.

b. If radio failure occurs after the delay clearance has been issued, aircraft shall exit the airspace at the expiration of the delay time.

c. If recovering VFR to Ellsworth AFB, the aircraft shall climb or descend to 15,500 feet MSL prior to departing the area and proceed directly to the Initial Approach Fix for the runway of departure or active runway, if known, and execute the approach in accordance with the procedures specified in the DOD Flight Information Handbook.

d. If recovering IFR to Ellsworth AFB, the aircraft shall climb or descend to 17,000 feet MSL or the lowest altitude of the assigned block, whichever is highest, prior to departing the area and proceed directly to the Initial Approach Fix for the runway of departure or active runway, if known, and execute the approach in accordance with procedures specified in the DOD Flight Information Handbook.

e. If not recovering to Ellsworth AFB, follow the procedures specified in CFR part 91.185 and the DOD Flight Information Handbook.

8. ATTACHMENTS:

a. Attachment 1. Powder River "A" MOA and Powder River "B" MOA.
b. Attachment 2. Powder River ATCAA and Gateway ATCAA.
c. Attachment 3. Crossbow ATCAA.
d. Attachment 4. Black Hills ATCAA and PRT Complex.
e. Attachment 5. Communications Frequencies.

BLM-MOU- MT925- 1001

MEMORANDUM OF UNDERSTANDING

between
Department of the Interior,
Bureau of Land Management, Montana State Office
and
the United States Air Force 28th Operations Group
Ellsworth Air Force Base, South Dakota
concerning
Airspace Coordination of Powder River Military Operating Area

1. PURPOSE

To provide procedures and guidance for the coordination of aerial operations within Powder River A and B Military Operations Areas hereinafter referred to as PRMOA, between the 28th Operations Support Squadron, (28 0SS) of Ellsworth Air Force Base (AFB), South Dakota hereinafter referred to as 28th OSS, and the Bureau of Land Management (BLM), Miles City Dispatch Center (MCDC), Miles City, Montana hereinafter referred to as MCDC.

2. AUTHORITIES / REFERENCES

Title 14 CFR, Sections 91, 73,
Federal Aviation Administration (FAA) Order JO 7610.4M Special Operations Training Guide
Federal Aviation Order JO7110.65 Air Traffic Control
AFI 25-201, Support Agreements Procedures, 1 May 2005
AFI 10-802, Military Support to Civil Authorities, 19 April 2002
BLM Departmental Manual 9400
Interagency Airspace Coordination Guide
Taylor Grazing Act of June 28, 1924 (48 Stat. 1269; 43 U.S.C. 315)
Federal Land Policy and Management Act of 1976, Sec. 307 (b) (43 U.S.C. 1737)
Federal Wildland Fire Management Policy and Program Review, 1995, 2000

3. SCOPE

This MOU applies to PRMOA airspace managed and controlled by the 28th OSS for joint-use by military aircraft of all service branches.

The MCDC authorities are responsible for conducting and coordinating aerial operations within the PRMOA airspace. All aircraft under BLM operational control shall adhere to Title 14 CFR Parts 91, 133, 137 and this document.

4. ADMINISTRATION

Nothing in this MOU shall obligate the BLM or the United States Air Force to expend appropriations or to enter into any contract or other obligation. Specific work projects or activities that involve the transfer of funds, services, or property between the parties to this MOU will require the execution of separate agreements or contracts, contingent upon the availability of funds as appropriated by Congress. Each subsequent agreement or arrangement involving the transfer of funds, services, or property shall be made in writing and shall be independently authorized by appropriate statutory authority and regulations, including those applicable to procurement activities.

Any records or documents generated as a result of this MOU shall become part of the official BLM record maintained in accordance with applicable BLM Records Management policies. Any request for release of records associated with the implementation of this MOU to anyone outside the parties must be determine based on applicable laws, including the Freedom of Information Act and the Privacy Act. The BLM cannot agree to maintain the confidentiality of information received from the Cooperating Agency except to the extent that it is permitted under the Freedom of Information Act and the Privacy Act.

5. RESPONSIBILITIES

A. The BLM is responsible for the following:

a. MCDC services as the focal point and primary contact for the coordination of all BLM aerial operations to include the issuance and cancellation of Temporary Flight Restrictions (TFRs), Title 14 CFR Section91.193. The BLM shall also be responsible for informing 28th OSS of any TFR changes.

b. Contact 28th OSS, as appropriate, to obtain prior approval for aircraft having an operational need to operate during Wildland fire incidents or other emergency operations within the PRMOA using the National Firefighting transponder Code of 1255.

c. Provide the 28th OSS with the up-to-date information concerning BLM activity within the PRMOA when requested.

d. Initiate the notification process for BLM activities affecting PRMOA in accordance with Flight Information publication (FLIP) AP/1B.

e. The BLM Montana Dakotas State Aviation Manager or assigned agency airspace coordination specialist shall:

1. Be the focal point for resolving difficulties in in scheduling airspace with the 28th OSS.
2. Coordination with 28th OSS Airspace Manager on all conflicts or incidents occurring within PRMOA.
3. Service as the focal point for administrative change sor additiosn to the MOU.

B. The 28th Operations Support Squadron will be responsible for:

a. Ensure TFR information is distributed to all flying unties utilizing the PRMOA.

b. Coordinate routine requests from BLM dispatchers that need to conduct aviation operation within PRMOA with other affected agencies.

c. Provide BLM with the up-too-date schedule information concerning DOD activity within the PRMOA when requested.

d. The Airspace manager at Ellsworth AFB is the Military focal point for administrative changes or additions to this document.

e. Provide BLM with a current copy of the 28 BW "Mid-Air Collision Avoidance (MACA) Program Guide"

6. COORDINATION PROCIEDRUES FOR NON-FIRE OPERATIONS

A. BLM Requirements:
When BLM dispatchers or aviation managers become aware of situations that my necessitate flight within the PRMOA , they shall:

a. Coordinate all BLM aviation operations affecting PRMOA with 28th OSS in a timely manner.

b. A pre-flight briefing of BLM aircrews will include scheduled PRMOA activity.

c. Notify 28th OSS of the completion of all flight activity at the end of each day as appropriate.

B. The 28th OSS, upon notification of BLM proposed aerial operations within PRMOA will:

a. Update military units scheduled for PRMOA, of non-military aviation operations scheduled for simultaneous activity. This advisory will include times, altitudes, and locations of non-military operations as well as a de-confliction plan.

b. Coordinate the current airspace status with MCDC and any scheduled flights for the requested time period.

c. Advise MCDC of any changes in PRMOA status that will not be conducive to joint operations and provide an estimate when operations can begin, or be resumed.

7. COORDINATION PROCEDURES FOR FIRE RESPONSE WITH (TFR): The BLM shall:

a.) Check status of PRMOA airspace using the FAA Special Use Area (SUA) website and confirm with 28th OSS.

b.) Notify 28th OSS of a fire location or upon the request of a TFR within the PRMOA

c.) Request a TFR with the appropriate FAA Air Route Traffic Control Center (ARTCC).

d.) Advise 28th OSS of any modification, changes, or cancellation of the TFR.

8. CANCELLATION OF TFRs

The TFRs will be canceled by BLM through established procedures at the appropriate ARTCC. The MCDC will notify 28th OSS, as appropriate, when air operations for the TFT are complete.

9. INCIDENT /ACCIDENT

In the event of an airspace incident involving BLM and DOD aircraft, the BLM and 28th OSS will notify the other agency immediately.

The BLM and the 28th OSS will follow their standard incident/accident or hazard reporting procedures and coordinate appropriately as needed.

Incidents shall be cooperatively reviewed between the BLM and Ellsworth AFB and reported appropriately.

10. EDUCATION AND AWARENESS

Education and awareness is essential to the mutual efforts to enhance interagency flight safety. Meetings between BLM and USAF personnel are encouraged to foster open communication.

APPENDIX N
GOVERNMENT-TO-GOVERNMENT AND SECTION 106 CORRESPONDENCE

This page intentionally left blank.

SUMMARY OF FORMAL TRIBAL COMMUNICATIONS

Several laws and regulations address the requirement of federal agencies to notify or consult with American Indian tribes or otherwise consider their interests when planning and implementing federal undertakings. A series of letters, emails, and phone calls were made to the four American Indian Reservations partially or wholly located under the airspace—the Crow Indian Reservation, the Northern Cheyenne Indian Reservation, the Standing Rock Indian Reservation, and the Cheyenne River Reservation. Letters drafted by the Department of the Air Force were mailed to each Tribal Historic Preservation Office (THPO) and relevant Bureau of Indian Affairs offices in addition to tribal councils, tribal chairmen, and committees in order to inform of the proposed Powder River Training Complex (PRTC) airspace and inquire about the arrangement of government to government meetings, and ask how tribal lands might be affected by the project.

Table N-1 is a summary of all formal contact with the Crow, Northern Cheyenne, Standing Rock Sioux, and Cheyenne River Sioux Tribes. Next is a series of tables summarizing e-mails (Table N-2), and letters to other Tribes (Table N-3), as well as a list of formal Section 106 Consultation correspondence to public agencies (Table N-4).

DEPARTMENT OF THE AIR FORCE
HEADQUARTERS 28TH BOMB WING (ACC)
ELLSWORTH AIR FORCE BASE SOUTH DAKOTA

15 Feb 08

Colonel Scott A. Vander Hamm
Commander, 28th Bomb Wing
1958 Scott Drive, Ste 1
Ellsworth AFB SD 57706-4710

Rick Wolfname, President
Northern Cheyenne Tribal Council
P.O. Box 128
Lame Deer MT 59043

Dear President Wolfname

I respectfully request a Government-to-Government consultation to discuss a proposal to establish a Military Operations Area (MOA) (Atch 1), in an area that overlies the Northern Cheyenne Indian Reservation.

The 28th Bomb Wing would prefer to personally meet with you and discuss the proposed airspace modifications and alternatives to the proposal to meet training needs of B-1 pilots at Ellsworth AFB SD and B-52 pilots from Minot AFB ND prior to the Air Force publicly releasing a Notice of Intent to prepare an Environmental Impact Statement. Public notification is tentatively scheduled for spring of 2008 and numerous public scoping meetings are being planned shortly after in the affected areas of Montana, Wyoming, North Dakota, and South Dakota (list attached). The scoping meetings were chosen based on their location to the proposed action and in areas we feel would obtain the most comprehensive public outreach. If you would like the Air Force to hold a separate scoping meeting for members of the Northern Cheyenne Tribe, please let me know or have a representative contact Ms. Linda DeVine (Air Combat Command Project Manager) at 757-764-9434 by March 10, 2008 to discuss details.

The scoping meetings will be in held in an open-house format where Air Force representatives will describe the proposed action and alternatives, the National Environmental Policy Act process which we are undertaking, outline opportunities for public involvement, and answer questions the public might have on the proposal. Public notification and details of the scoping meetings will be published in the Federal Register and local papers in advance.

Please contact me at (605) 385-2801 or 1Lt Lauren Wright, public affairs, at (605) 385-5056.

Sincerely,

SCOTT A. VANDER HAMM, COLONEL, USAF

Global Power For America

DEPARTMENT OF THE AIR FORCE
HEADQUARTERS AIR COMBAT COMMAND
LANGLEY AIR FORCE BASE, VIRGINIA

JUN 12 2008

Ms. Kathleen Burrage
Crow Nation Office of Legal Counsel
Batcheeitche Avenue
PO Box 340
Crow Agency MT 59022

Dear Ms. Burrage

The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

As part of this Environmental Impact Analysis Process, and in continuance of Government-to-Government consultation initiated by Colonel Scott Vander Hamm, 28 BW/CC, Ellsworth AFB SD, we request your assistance in gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

Global Power For America

The Air Force is committed to community outreach and we appreciate the opportunity to hold a community meeting at the Apsaalooke Center in Crow Agency on Monday, June 23, 2008 from 9:30 – 11:30 a.m. Open communication of issues is a critical element of the EIS process, and we would appreciate your assistance in posting the attached meeting flyer (Atch 2) around the community and encouraging public participation. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP, 129 Andrews Street, Room 317, Langley AFB VA 23665-2769, not later than August 4, 2008. If you have any specific questions about this request, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. You may also obtain information including the two attachments to this letter, from our website at www.accplanning.org. Thank you in advance for your assistance in this matter.

Sincerely,

BRUCE W. MACDONALD, P.E.
Acting Chief, Programs Division

Global Power For America

DEPARTMENT OF THE AIR FORCE
HEADQUARTERS AIR COMBAT COMMAND
LANGLEY AIR FORCE BASE, VIRGINIA

JUN 12 2008

Ms. Clara Caufield
Northern Cheyenne Tribal Administration Offices
600 S. Cheyenne Ave.
Lame Deer, MT 59043

Dear Ms. Caufield,

The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

As part of this Environmental Impact Analysis Process, and in continuance of Government-to-Government consultation initiated by Colonel Scott Vander Hamm, 28 BW/CC, Ellsworth AFB SD, we request your assistance in gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

Global Power For America

The Air Force is committed to community outreach and we appreciate the opportunity to hold a community meeting at the Northern Cheyenne Tribal Administration Building Council Chambers on Tuesday, June 24, 2008 from 9:30 – 11:30 a.m. Open communication of issues is a critical element of the EIS process, and we would appreciate your assistance in posting the attached meeting flyers (Atch 2) around the community and encouraging public participation. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP, 129 Andrews Street, Rm 317, Langley AFB VA 23665-2769 not later than August 4, 2008. If you have any specific questions about this request, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. You may also obtain information including the two attachments to this letter, from our website at www.accplanning.org. Thank you in advance for your assistance in this matter.

Sincerely,

BRUCE W. MACDONALD, P.E.

Global Power For America

DEPARTMENT OF THE AIR FORCE
HEADQUARTERS AIR COMBAT COMMAND
LANGLEY AIR FORCE BASE, VIRGINIA

JUN 12 2008

Mr. Donald Red Thunder
Land Operations Office
Building 2001
Main Street
Eagle Butte SD 57625

Dear Mr. Red Thunder,

The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

As part of this Environmental Impact Analysis Process, and in continuance of Government-to-Government consultation initiated by Colonel Scott Vander Hamm, 28 BW/CC, Ellsworth AFB SD, we request your assistance in gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

Global Power For America

The Air Force is committed to community outreach and we appreciate the opportunity to hold a community meeting at the Multi-Purpose Building in Dupree on Wednesday, July 16, 2008 from 4:00 – 7:00 p.m. Open communication of issues is a critical element of the EIS process, and we would appreciate your assistance in posting the attached meeting flyers (Atch 2) around the community and encouraging public participation. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP, 129 Andrews Street, Room 317, Langley AFB VA 23665-2769 not later than August 4, 2008. If you have any specific questions about this request, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. You may also obtain information including the two attachments to this letter, from our website at www.accplanning.org. Thank you in advance for your assistance in this matter.

Sincerely,

BRUCE W. MACDONALD, P.E.
Acting Chief, Programs Division

MEMORANDUM FOR Bureau of Indian Affairs
Great Plains Regional Office
115 4th Ave. SE
Aberdeen, SD 57401

FROM: HQ ACC/A7P
129 Andrews Street
Langley AFB VA 23665-2769

SUBJECT: Powder River Training Complex, Environmental Impact Statement (EIS)

1. The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

2. The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

3. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

4. The Air Force is committed to community outreach. Recognizing that open communication of issues is a critical element of the EIS process, the Air Force will host public meetings in

Global Power For America

communities underlying and/or adjacent to the proposed airspace as identified in the meeting flyer at attachment 2. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. The 28 Bomb Wing Commander at Ellsworth AFB has initiated consultation with the tribal leaders of the Crow, Northern Cheyenne, Standing Rock and Cheyenne River Nations and community meetings are being coordinated on each Native American Reservation. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

5. To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP at the above address not later than August 4, 2008. If you have any specific questions about this proposal, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. You may also obtain information including the two attachments to this letter, from our website at www.accplanning.org. Thank you in advance for your assistance in this matter.

Dear Sir/Madam,

The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

As part of this Environmental Impact Analysis Process, the Air Force would like to consider your concerns and initiate Government-to-Government consultation regarding the proposed action. We are in the early stages of gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

The Air Force is committed to community outreach. Recognizing that open communication of issues is a critical element of the EIS process, the Air Force will host public

meetings in communities underlying and/or adjacent to the proposed airspace as identified in the meeting flyer at attachment 2. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP at the above address not later than August 4, 2008. If you have any specific questions about this proposal, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. Dear Sir/Madam,

The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

As part of this Environmental Impact Analysis Process, the Air Force would like to consider your concerns and initiate Government-to-Government consultation regarding the proposed action. We are in the early stages of gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

Global Power For America

The Air Force is committed to community outreach. Recognizing that open communication of issues is a critical element of the EIS process, the Air Force will host public meetings in communities underlying and/or adjacent to the proposed airspace as identified in the meeting flyer at attachment 2. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP at the above address not later than August 4, 2008. If you have any specific questions about this proposal, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. You may also obtain information including the two attachments to this letter, from our website at www.accplanning.org. Thank you in advance for your assistance in this matter.

Sincerely,

BRUCE W. MACDONALD, P.E.
Acting Chief, Programs Division

LANGLEY AIR FORCE BASE, VIRGINIA

JUN 3 2008

Three Affiliated Tribes Business Council
404 Frontage Road
New Town, ND 58763

Dear Sir/Madam,

The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

As part of this Environmental Impact Analysis Process, the Air Force would like to consider your concerns and initiate Government-to-Government consultation regarding the proposed action. We are in the early stages of gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. We are in the early stages of gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

Global Power For America

The Air Force is committed to community outreach. Recognizing that open communication of issues is a critical element of the EIS process, the Air Force will host public meetings in communities underlying and/or adjacent to the proposed airspace as identified in the meeting flyer at attachment 2. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP at the above address not later than August 4, 2008. If you have any specific questions about this proposal, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. You may also obtain information including the two attachments to this letter, from our website at www.accplanning.org. Thank you in advance for your assistance in this matter.

Sincerely,

BRUCE W. MACDONALD, P.E.
Acting Chief, Programs Division

Global Power For America

DEPARTMENT OF THE AIR FORCE
HEADQUARTERS AIR COMBAT COMMAND
LANGLEY AIR FORCE BASE, VIRGINIA

JUN 3 2008

Spirit Lake Sioux Tribal Council
PO Box 359
Fort Totten, ND 58335

Dear Sir/Madam,

The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1).

As part of this Environmental Impact Analysis Process, the Air Force would like to consider your concerns and initiate Government-to-Government consultation regarding the proposed action. We are in the early stages of gathering information concerning previous archaeological and historic studies for the areas under the affected region. We would appreciate any assistance you could provide in identifying and retrieving this important information, as well as concerns you may have about the potential effects of the proposal on significant cultural resources. All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

The Air Force is committed to community outreach. Recognizing that open communication of issues is a critical element of the EIS process, the Air Force will host public

Global Power For America

meetings in communities underlying and/or adjacent to the proposed airspace as identified in the meeting flyer at attachment 2. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the NHPA with public involvement in the EIS prepared under the Environmental Impact Analysis Process. Meetings with public, agency, and Native American stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues to be considered in the environmental impact analysis process.

To ensure the Air Force has sufficient time to consider your input in the preparation of the Draft EIS, please provide information and/or comments to Ms. Linda DeVine, HQ ACC/A7PP at the above address not later than August 4, 2008. If you have any specific questions about this proposal, please feel free to contact Ms. Linda DeVine at (757) 764-9434, or by electronic-mail at acc.prtc@langley.af.mil. DEPARTMENT OF THE AIR FORCE
HEADQUARTERS AIR COMBAT COMMAND
LANGLEY AIR FORCE BASE, VIRGINIA

JUN 3 2008

MEMORANDUM FOR DISTRIBUTION

FROM: HQ ACC/A7P
129 Andrews Street, Room 317
Langley AFB VA 23665-2769

SUBJECT: Powder River Training Complex, Environmental Impact Statement (EIS)

1. The United States Air Force (Air Force) is in the process of preparing an EIS to assess the potential environmental consequences of a proposal to expand and enhance the existing Powder River Complex (PRC) near Ellsworth Air Force Base (AFB) SD. The proposal would create the Powder River Training Complex (PRTC). The PRTC would more effectively use limited resources and finite flying hours by providing locally the realistic training needed by B-1 and B-52 aircrews flying from Ellsworth AFB SD and Minot AFB ND, respectively. This airspace proposal addresses the training and other limitations affecting the existing PRC training assets as they are currently configured.

2. The proposed action would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs). The PRTC proposal would establish two air refueling routes, create additional low altitude MOA (500 feet Above Ground Level [AGL] up to, but not including, 18,000 feet above Mean Sea Level [MSL]) and high-altitude ATCAA (18,000-60,000 MSL) combinations in portions of South Dakota, North Dakota, Wyoming and Montana. The proposal would support additional ground-based assets to simulate threats and an increase in aircraft training flights, permit the use of training chaff and flares, and authorize supersonic flight above 10,000 AGL. Three action alternatives and a no-action alternative have currently been identified for analyses and are discussed in the attached meeting brochure (Atch 1). All or portions of the following locations have the potential of being affected by the proposal's overhead training airspace due to one or more of the alternatives: ***Montana***—Crow and Northern Cheyenne Reservations and the counties of Big Horn, Carter, Custer, Fallon, Powder River, Rosebud, Treasure, and Yellowstone; ***North Dakota***—Standing Rock Reservation and Adams, Billings, Bowman, Golden Valley, Grant, Hettinger, Morton, Sioux, Slope, and Stark counties; ***South Dakota***—Standing Rock and Cheyenne River Reservations, and Butte, Corson, Harding, Lawrence, Meade, Pennington, Perkins, Ziebach counties; and ***Wyoming***: Campbell, Crook, Sheridan, and Weston counties.

3. Recognizing that open communication of issues is a critical element of the EIS process, the Air Force will host numerous public meetings in communities underlying and/or adjacent to the proposed action (Atch 2). The scoping meetings will be in held in an open-house format, where Air Force representatives will describe the proposed action and alternatives, the National Environmental Policy Act process which we are undertaking, outline opportunities for public involvement, and answer questions on the proposal. The meetings will last from 4:00 to 7:00 pm

Global Power For America

at all locations, and interested parties or citizens are welcome to come at any time since information will be provided throughout the duration of the open house.

4. Meetings with public and agency stakeholders during this scoping process will help identify the full range of reasonable alternatives, potential impacts, and key issues throughout the environmental impact analysis process. The Air Force intends to coordinate public involvement for the purpose of Section 106 review under the National Historic Preservation with public involvement in the EIS prepared under this Environmental Impact Analysis Process. The Federal Aviation Administration has accepted the Air Force's request to be a cooperating agency for this action and has appointed the Central Service Area as their office of primary responsibility for this EIS.

5. The Air Force will accept comments at any time during the environmental process and any information you feel would assist us in this process would be appreciated. To ensure the Air Force has sufficient time to consider public input in the preparation of the draft EIS, information and comments should be submitted to Ms. Linda DeVine, HQ ACC/A7PP, 129 Andrews Street, Room 317, Langley AFB VA 23665-2769 by August 4, 2008.

6. If you have any specific questions about this proposal, please feel free to contact Ms. DeVine at (757) 764-9434, by electronic-mail at acc.prtc@langley.af.mil or contact the public affairs office at Ellsworth AFB SD, 605-385-5056. You may also obtain information including the two attachments to this letter, from our website at www.accplanning.org. Thank you in advance for your assistance in this matter.

Linda DeVine, PRTC EIS Manager
129 Andrews St., Ste 102
Langley AFB, VA 23665-2769

Dear Ms. DeVine;

The Northern Cheyenne Tribe appreciates your efforts in assuring that all parties are included in the scoping process. We are currently conducting an internal analysis from tribal programs and departments for comments and concerns regarding the Powder River Training Complex (PRTC) and the long term effects on the Northern Cheyenne reservation.

We would like to set up a meeting during the month of August as part of the government to government consultation process with Indian tribes. Specifically, the Northern Cheyenne Tribe would like to meet with the United States Air Force and discuss the effects of the PRTC management plan within the Northern Cheyenne reservation and ancestral lands within the PRTC.

A tentative date during the week of the 11th of August has been suggested. If this date is suitable please let our office know so that we can schedule a meeting with the Northern Cheyenne Tribal Council.

We would also like to request that the comments gathered will be forwarded to your office two (2) weeks after the suggested meeting has occurred.

If you have any questions, please let my office know.

Sincerely,

Geri Small, President
Northern Cheyenne Tribe

LITTLE WOLF AND MORNING STAR - Out of defeat and exile they led us back to Montana and won our Cheyenne homeland that we will keep forever.

Ms. Linda DeVine
HQ ACC/A7PP
129 Andrews Street, Suite 317
Langley Air Force Base, Virginia 23665-2769

Dear Ms. DeVine:

The Department of the Interior (Department) has asked the National Park Service (NPS) to review and comment on the Notice of Intent to prepare an Environmental Impact Statement (EIS) for the Powder River Complex expansion located near Ellsworth Air Force Base, South Dakota. We offer the following comments for your consideration:

The proposed Powder River Complex expansion affects the northeast part of Wyoming, the southeast part of Montana, the southwest part of North Dakota, and the northwest part of South Dakota. National parks in the area include Theodore Roosevelt National Park, Mount Rushmore National Memorial, Devils Tower National Monument, Bighorn Canyon National Recreation Area, and Little Bighorn Battlefield, which are located within or very near the expansion area. The NPS is concerned about the potential of the proposed action to adversely affect the soundscapes of these parks.

The NPS evaluates Federal actions which may impact the human and natural environment within our parks with respect to our Organic Act mandates, including:

> ... to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such a manner and by such means as will leave them unimpaired for the enjoyment of future generations.

We are different from other Federal land management agencies in that, in addition to our national legislative mandates, each individual park is established under separate legislative authority which identifies specific purposes for the park and often includes the identification of key natural or cultural resources which define the integrity of the park.

Natural and cultural sounds are integral components of the suite of resources and values which NPS managers are charged with preserving and restoring. A soundscape refers to the total acoustic environment of an area. The soundscape (like air, water, scenery, or wildlife) of a national park is a valuable resource that can easily be degraded or destroyed by inappropriate sound levels and frequencies. An area's ability to transmit ecologically significant sounds is a function of the amount of extraneous noise intrusion.

We understand, at this stage in the process, the U.S. Air Force (USAF) would not include information in the Notice of Intent regarding how the environmental impact analysis would be

TAKE PRIDE® IN AMERICA

conducted. However, we are aware the USAF typically uses the day-night average sound level (DNL) metric in their environmental impact assessments. The DNL is an energy-based noise-averaging metric widely used by the Federal Aviation Administration (FAA) and the Department of Defense as the primary means for determining the cumulative noise energy exposure of individuals to noise resulting from aviation activities. Therefore, thresholds of significance that have been established by the FAA are based on community response. The FAA Order 1050.1E notes that special consideration needs to be given to the evaluation of the significance of noise impacts on noise sensitive areas within national parks. Since assumptions regarding the DNL levels are community-based in relation to airports, this metric is not adequate to assess impacts of noise to park resources, values, and visitor experience.

The NPS mission to conserve unimpaired park resources and values is a different standard than significance as defined by the FAA and other agencies. In recognition of the agencies' differences in mission and acknowledgement that special consideration needs to be given to the evaluation of noise impacts on noise-sensitive areas, it is imperative to provide information in the EIS for the NPS to be able to characterize the noise impacts from the proposed action and alternatives. Only then can Park Managers make decisions about impacts to park resources, values, and visitor experience. The NPS uses audibility-based, or "time above," metrics in order to express the time the sound level is above ambient. This takes into account the duration of aircraft noise events, the number of aircraft noise events, and the absolute sound level of events. "Time above" metrics correlate better with flight operations than the DNL metrics which obscure the dynamic range of acoustic events (www.fican.org/pdf/HanscomNoise.pdf). These supplemental metrics would also better satisfy the requirements under the National Environmental Policy Act (NEPA) to characterize impacts to the environment in terms of intensity, context, and duration (40 CFR 1508.27). The NPS Natural Sounds Program would be happy to discuss the inclusion of supplemental metrics in the EIS with the USAF.

We are concerned that the proposed expansion of existing military operations airspace would allow flights down to 500 feet above ground level as well as permitting supersonic flights within the proposed Powder River Complex expansion. The NPS would prefer no supersonic or low-level flights over park units. For example, the NPS worked with the FAA to establish a No-Fly Advisory Zone for the Devils Tower National Monument. The existing No-Fly Zone Advisory Bulletin between the Billings Area FAA and the Devils Tower National Monument is enclosed for your reference. Alternative B would appear to support our desire for no low-level flights over park units. We are also concerned about the use of chaff and flares in and near park units.

We seek mutually beneficial solutions related to impacts associated with the proposed project – solutions that articulate how natural and cultural values interrelate in healthy ecosystems/cultural landscapes, and how public enjoyment of these places as well as the need to ensure realistic training needed by the USAF can be part of a strategy for ensuring the resources are protected unimpaired for future generations. The NPS has worked with the USAF through the Regional Airspace/Range Council meetings regarding military overflight issues, and has found the USAF to be very receptive to the NPS concerns and willing to find mutually acceptable solutions. We have

every confidence that this proactive interagency relationship will continue throughout the NEPA process and we look forward to working with the USAF regarding the NPS concerns about the proposed Power River Complex expansion.

The Department has a continuing interest in working with the USAF to ensure impacts to resources of concern to the Department are adequately addressed. For matters related to these comments, please contact Regional Environmental Coordinator Nick Chevance, National Park Service, Midwest Regional Office, 601 Riverfront Drive, Omaha, Nebraska 68102-4226, telephone: 402-661-1844.

We appreciate the opportunity to provide these comments.

Sincerely,

Ernest Quintana
Regional Director

Devils Tower National Monument

No-Fly Advisory Zone

When the airport at Hulett, Wyoming (W43) was established, an agreement between the Federal Aviation Administration, Town of Hulett, Hulett Airport Advisory Board and Devils Tower National Monument created a "No-Fly Advisory Zone".

The No-Fly Advisory Zone recognizes the cultural significance of Devils Tower as a sacred site to over 20 American Indian Tribes, as well as the monument's purpose to preserve the lofty and isolated rock and surrounding public land as an object of historic and scientific interest for the enjoyment, education and inspiration of this and future generations.

The advisory is centered on Devils Tower, (Lat: 44°35'25.86"N, Long: 104°42'54.57"W) and extends for 2 nautical miles (NM) throughout the year, except for the month of June, when it extends for 3 nautical miles. The advisory includes no overflights of the Tower throughout the year. The Hulett (W43) airport is approximately 7.5 nautical miles northeast of Devils Tower. Pilots are advised to fly routes in northeasterly or southeasterly directions when using the airport for arrivals or departures to avoid the no-fly advisory zone.

Subject: Invitation ot Participate in Sec 106 Consultaion

Nancy,

The Air Force, and more specifically Air Combat Command (ACC) and Ellsworth AFB, proposes to expand its current Powder River Training Complex (PRTC) from a fly-over area of approximately 14,800 square miles to as much as 37,800 square miles. A Notice of Intent to prepare an Environmental Impact Statement for this proposal was published in the Federal Register on 29 May 2008.

The proposed expansion of the PRTC has the potential to directly impact four states (North Dakota, South Dakota, Montana, and Wyoming) and four Indian Reservations (the Cheyenne River in South Dakota, the Standing Rock in North and South Dakota, and the Northern Cheyenne and Crow in Montana). Other tribes not a part of these reservations may also attach religious and/or cultural significance to the areas affected and thus become consulting parties in the Section 106 process.

During June and July 2008, public scoping meetings were held at numerous locations affected by the proposed range expansion both on and off the reservations. Many written public comments were received that will be considered and addressed in the EIS.

Colonel Vander Hamm, Commander, 28th Bomb Wing, Ellsworth AFB, SD, has met on a government-to-government basis with leaders of the four primary tribes to explain the proposal and how they and their reservations may have the potential to be affected by training missions. These meetings were held prior to the public scoping meetings.

Pursuant to CFR 36 Part 800, I would like to take this opportunity to invite the ACHP to participate in further Section 106 consultation along with the appropriate SHPOs and/or THPOs affected by or having an interest in the PRTC expansion proposal. Thank you for your consideration and I look forward to your reply.

Sincerely,

John Morgenstern

REF: Proposed Expansion of the Powder River Training Complex

Dear Mr. Morgenstern:

On December 1, 2008, the Advisory Council on Historic Preservation (ACHP) received your notification for the referenced project which was submitted in accordance with Section 800.6(a)(1) of our regulations, "Protection of Historic Properties" (36 CFR Part 800). Unfortunately, the background documentation included with your submission does not meet the specifications listed in Section 800.11(e). We, therefore, are unable to determine whether Appendix A of the regulations, *Criteria for Council Involvement in Reviewing Individual Section 106 Cases*, applies to this undertaking. Accordingly, we request that you submit the following information so that we can determine whether our participation is warranted:

- A description of the undertaking, including photographs, maps, drawings, as necessary;
- A description of the steps to identify historic properties;
- A description of the affected historic properties;
- A description of the undertaking's effect on historic properties;
- An explanation of why the criteria of adverse effect were found applicable or inapplicable; and
- Copies or summaries of any views provided by consulting parties and the public, including
  comments from the Tribal Historic Preservation Officers, Indian tribes, and the appropriate State Historic Preservation Officers (SHPOs)

Upon receipt of the additional information, we will notify you within 15-days of our decision. Should you have any questions, feel free to contact Nancy Brown at 202-606-8582, or via email at nbrown@achp.gov.

Sincerely,

Raymond V. Wallace

Subject: Proposed Expansion of the Powder River Training Complex

Nancy,

I am writing to let you know I (we) have not forgotten or overlooked the ACHP letter dated December 3, 2008, (*REF: Proposed Expansion of the Powder River Training Complex*) requesting additional information/background documentation per 36 CRF Part 800, Section 800.11 (e). Most of the additional background documentation has been compiled; however, some significant details of the proposed undertaking are still being developed and coordinated between the Air Force and the FAA.

When details have been finalized, a description of the proposed undertaking along with the other background documentation will be forwarded to your office as requested.

Please feel free to contact me if you have questions or concerns.

Sincerely,

John Morgenstern

DEPARTMENT OF THE AIR FORCE
HEADQUARTERS 28TH BOMB WING (ACC)
ELLSWORTH AIR FORCE BASE SOUTH DAKOTA

AUG 0 5 2009

Colonel Jeffrey B. Taliaferro
Commander, 28th Bomb Wing
1958 Scott Drive, Ste 1
Ellsworth AFB SD 57706-4710

Mr. Leroy Spang, President
Northern Cheyenne Council
PO Box 128
Lame Deer MT 59043

Dear President Spang

Having recently assumed command of the 28th Bomb Wing, I am writing to introduce myself prior to the scheduled government-to-government consultation with the Northern Cheyenne Tribal Council on August 17.

I believe meeting will help us both better understand our unique perspectives and continue the meaningful dialogue initiated by Colonel Vander Hamm between the Northern Cheyenne Tribe and Team Ellsworth. Our discussions must be open and honest, respecting each other's cultures, and trusting of each other's desire to maintain a healthy relationship. My goal for this consultation is to get to know you and other members of the tribal council, and to help me better understand and address the concerns identified in President Small's letter to the Air Force on September 8, 2008 in response to the scoping process for the proposed Powder River Training Complex (PRTC). If you have other specific issues you'd like to discuss, please feel free to contact me prior to the scheduled meeting so I can arrive more prepared, and we can make the meeting more productive.

We also welcome you and other members of the tribal council to visit Ellsworth Air Force Base as it would give us an opportunity to familiarize you with our base and the B-1 bomber. I look forward to meeting you and learning more about the people of the Northern Cheyenne Tribe.

Please contact me at (605) 385-2801 if you have any questions. If it's helpful, please feel free to have someone contact Mr. John Morgenstern, my natural and cultural resources manager, at (605) 385-2690.

Sincerely

JEFFREY B. TALIAFERRO, Colonel, USAF

Global Power For America

PROGRAMMATIC AGREEMENT
AMONG
28th BOMB WING, ELLSWORTH AIR FORCE BASE,
THE STATE HISTORIC PRESERVATION OFFICES OF
MONTANA, NORTH DAKOTA, SOUTH DAKOTA AND WYOMING,
AND
THE ADVISORY COUNCIL ON HISTORIC PRESERVATION
REGARDING THE PROPOSED DEVELOPMENT, IMPLEMENTATION AND OPERATION
OF THE POWDER RIVER TRAINING COMPLEX

WHEREAS, the United States Air Force (AF), represented by the 28th Bomb Wing (hereafter "the 28 BW"), operates and maintains Ellsworth Air Force Base (EAFB), South Dakota, and

WHEREAS, the 28 BW is responsible for identifying and managing historic properties at EAFB and identifying and considering effects to historic properties in areas used by the base for training, pursuant to Section 106 of the National Historic Preservation Act (NHPA) (16 USC §470f) and its implementing regulation, 36 CFR Part 800 (hereafter jointly referred to as "Section 106"); and

WHEREAS, the 28 BW proposes to establish the Powder River Training Complex (PRTC) to provide suitable and realistic training for military aircrews of multiple B-1 and B-52 squadrons assigned primarily to EAFB and Minot AFB, North Dakota. It would restructure and reconfigure the existing Powder River Military Operations Areas (MOAs) and associated Air Traffic Control Assigned Airspaces (ATCAAs) and add airspaces to become the PRTC. The establishment, development, and operation of the PRTC (also referred to in this document as "the undertaking") would overlay about 35,000 square miles or 22.5 million acres in South Dakota, North Dakota, Montana, and Wyoming (Attachment 1), the lands beneath the PRTC airspace constituting the area of potential effect to historic properties; and

WHEREAS, the PRTC would designate the following training areas: Powder River (PR)-1A through 1D, PR-2, PR-3, PR-4 MOA/ATCAA; GAP A, B, and C MOA/ATCAA; and Gateway East and West MOA/ATCAA, as depicted in Attachments 1 and 2;and

WHEREAS, the PRTC would not require construction or other ground disturbance within the complex or at the using installations; supersonic flights for both fighter and bomber aircraft within the PRTC would occur only during Large Force Exercises (LFEs) which could be held quarterly but total no more than ten (10) days per year; an altitude of 10,000 feet above ground level (AGL) is proposed as the supersonic floor for all fighter aircraft during LFEs and 20,000 feet above mean sea level (MSL) is proposed as the floor for B-1 supersonic flight during LFEs; chaff bundles and flares would be employed throughout the PRTC airspace for countermeasures training with flares being used only at or above 2,000 feet AGL and only if conditions are suitable; and

WHEREAS, some 240 National Register of Historic Places (NRHP) listed properties are located beneath the PRTC airspace, including several National Historic Landmarks (NHLs) and Monuments (Attachment 3), as well as hundreds of recorded and unrecorded NRHP eligible archaeological sites, ghost towns, historic ranches, cultural landscapes, and places of traditional, religious, and cultural importance; and

WHEREAS, 28 BW has determined that the undertaking may have potential adverse effects that cannot be identified or anticipated today, that the potential exists for discovery of new historic properties in the PRTC and for changes in how such properties are understood and appreciated; and

WHEREAS, the AF and the Federal Aviation Administration (FAA) , Central Service Center agree that, pursuant to 36 CFR §800.2(a)(2), the AF is hereby designated as the lead federal agency for purposes of compliance with Section 106 for the PRTC undertaking and the FAA is an invited signatory to this programmatic agreement (hereafter "PA"); and

WHEREAS, the AF is the lead agency and the FAA is a cooperating agency under the National Environmental Policy Act (NEPA) for development of the Environmental Impact Statement (EIS) for the PRTC proposal; and

WHEREAS, pursuant to 36 CFR §800.10(b) and 36 CFR §800.6(a)(1)(iii), the 28 BW has requested and received the participation of the Advisory Council on Historic Preservation (ACHP) in consultations leading to the development of this PA and to become a signatory to this PA; and

WHEREAS, the 28 BW has consulted with the State Historic Preservation Officers (hereafter "SHPOs") of Montana, North Dakota, South Dakota, and Wyoming to identify historic properties on lands within said states under the PRTC, and to discuss potential adverse effects from the proposed undertaking, and

WHEREAS, the 28 BW has consulted with the National Park Service (NPS) to identify historic properties on lands managed by it under the PRTC, and to assess adverse effects from overflights associated with the undertaking; and

WHEREAS, the 28 BW recognizes the additional requirements, per 36 CFR §800.10, for NHLs and specifically for Bear Butte, Frawley Historic Ranch, Deadwood Historic District, Deer Medicine Rocks, Wolf Mountains Battlefield/Where Big Crow Walked Back and Forth NHL, and Rosebud Battlefield which are situated on lands under or immediately adjacent to the existing training airspace of PRTC, and that the 28 BW requested and confirmed participation of the NPS and the ACHP in this consultation; and

WHEREAS, the U.S. Air Force Air Combat Command in June 2008 contacted tribes outside the APE that may have traditional cultural and religious affiliations to lands under the PRTC, including Spirit Lake Sioux Tribal Council, the Fort Peck Tribal Executive Board, the Fort Belknap Community Council, the Confederated Salish and Kootenai Tribe, the Oglala Sioux Tribal Council, the Arapaho Business Council, the Rosebud Sioux Tribe, the Eastern Shoshone Tribal Council, the Three Affiliated Tribes Business Council, the Turtle Mountain Tribal Council, and the Chippewa-Cree Business Committee; and

WHEREAS, the 28 BW consulted on the PRTC proposal since 2008 with the Cheyenne River Sioux Tribe, the Crow Tribe, the Northern Cheyenne Tribe, and the Standing Rock Sioux Tribe (hereafter, "Tribes"), each of which have tribal lands underneath the PRTC where military overflights, but no ground activities, would occur and provided each Tribe opportunities to consult on the development of and to become invited signatories to this PA; and

WHEREAS, the 28 BW has provided the Tribes opportunities to identify historic properties of traditional religious and cultural importance under the PRTC airspace, and on which the 28 BW will continue to consult through its devised continual approach to identify and evaluate properties of religious and cultural significance to Indian tribes in conjunction with the operation of the PRTC; and

WHEREAS, 28 BW solicited the views of the public on the PRTC through public hearings and other means associated with NEPA, in accordance with 36 CFR §§800.2(d)(3) and 800.8(a); and

WHEREAS, the NPS, Intermountain Region, and the Little Bighorn Battlefield National Monument intend to undertake a multi-year acoustic monitoring program and a visitor use study that will survey visitors regarding sounds that a visitor would expect at a national battlefield and investigate particular military aircraft noises and associated annoyance levels as a result of the PRTC;

NOW, THEREFORE, the 28 BW, the FAA, the NPS, the SHPOs, and the ACHP agree that the undertaking shall be implemented in accordance with the following stipulations in order to take into account the effect of the undertaking on historic properties.

STIPULATIONS

I. Avoidance, Minimization, or Mitigation of Adverse Effects to Historic Properties under the PRTC

A. Great Sioux War Battlefields: Little Bighorn Battlefield National Monument (Monument), Montana

1. 28 BW shall:

a) Ensure that all military aircraft, when overflying the area of the Monument indicated on the map in Attachment 4 of this PA:

(1) Maintain an altitude of at least 5,000 feet AGL from one (1) hour before to one (1) hour after posted Hours of Operation of Little Bighorn Battlefield National Monument.

(2) Consider further restrictions of planned and potential PRTC activities during special events at the Monument.

b) Prohibit supersonic operation of aircraft when overflying the Little Bighorn Supersonic Avoidance Area above the area bounded by Powder River 1C, as indicated on the map in Attachment 4.

c) Coordinate on plans for multi-year acoustic monitoring in the Monument when requested by the NPS.

d) Coordinate on plans for a visitor use study when requested by the NPS.

2. NPS shall promptly inform the 28 BW of military aircraft overflights of the Monument that are contrary to the stipulations immediately above, within 24 hours of the overflight event.

B. Great Sioux War Battlefields historic properties in Montana, South Dakota, and North Dakota other than the Monument including, but not limited to, Deer Medicine Rocks and Wolf Mountains Battlefield/Where Big Crow Walked Back and Forth; and archaeological locations containing sensitive rock art throughout the area of potential effect, including the Tongue River Valley, Chalk Butte, and Slim Butte, Montana and North and South Cave Hills, South Dakota

1. 28 BW shall:

a) Work cooperatively with other federal and state agencies, tribal governments, and the public to minimize potential adverse effects to historic properties in the PRTC from routine operations or from LFEs.

b) Energetically comply with the procedures in Stipulations III through V. The effectiveness of these procedures depends in part on the actions of consulting parties and the public to inform the 28 BW of potential adverse effects from military operations or non-compliance with the requirements of this agreement; see Stipulation IX.B.

c) Consult with the relevant consulting parties on appropriate responses, if, as a result of notifications and follow on assessments by the 28 BW, further mitigating actions may be required.

II. Avoidance, Minimization, or Mitigation of Adverse Effects to Historic Properties, Religious Ceremonies, and Important Tribal Events under the PRTC

A. The 28 BW shall continue to consult with the Tribes on appropriate ways to avoid, minimize, or mitigate adverse effects to historic properties, religious ceremonies, and events important to the Tribes.

1. This includes 28 BW authorizing reasonable temporary or seasonal avoidance areas for training objectives during the following events after consulting with the appropriate Tribe:

a) the "Crow Fair" of the Crow Tribe (PR-1A and PR-1C)

b) the "4th of July Chiefs Powwow" of the Northern Cheyenne Tribe (PR-1D)

c) the "Porcupine Powwow" of the Standing Rock Sioux Tribe (PR-4)

d) the "Fair Rodeo and Labor Day Powwow" of the Cheyenne River Tribe (PR-4); or

e) other events, now and in the future as identified by 28 BW in consultation with the Tribes.

2. Within six (6) months of executing this PA, 28 BW shall appoint a a senior-level installation person as a Tribal Liaison to serve as the primary point of contact in facilitation of the government-to-government relationships with the Tribes, and coordinating and directing the 28 BW's participation in joint efforts.

a) Until such position is designated, the 28 BW Airspace Manager shall serve as the interim liaison.

b) The 28 BW will advise the Tribes within one (1) month of any changes to this liaison position.

3. 28 BW shall meet with Tribal leaders at least annually to review PRTC-related activities that may affect historic properties of traditional and religious importance to the Tribes.

B. A Tribe that is an invited signatory to this PA shall:

1. Designate a point of contact (POC) to act as liaison with the 28 BW Tribal Liaison to coordinate and direct tribal participation identified in this PA, and advise the 28 BW in a timely manner of any changes to this position.

2. Provide appropriate information to the 28 BW regarding historic properties, to include properties of traditional religious and cultural importance, which may be affected by military aircraft training that would occur in the PRTC and adjacent areas, when requested by the 28 BW.

3. Review and provide comments on draft Air Force plans, programs, and reports for PRTC training and operations, upon request by the 28 BW. Negative replies are requested if no comments will be forthcoming. Planning responsibilities often require 28 BW to set timelines for responses. The 28 BW leadership will consider all comments received within these timelines when making a decision. Responses received after a timeline expires will be considered if practicable.

III. Awareness Training for Military Trainers and Aircrews Operating in the PRTC

A. 28 BW shall:

1. Prepare, within three (3) months of executing this PA, a comprehensive in-brief presentation covering current operating procedures, to include cultural sensitivities and mitigation procedures for flying units preparing to train in the PRTC airspace prior to their training within the PRTC.

a) Ensure all military aircrews participating in the LFEs be certified by their Unit Commander that they have received this comprehensive in-brief.

b) Include a summary of all training provided in the annual report in accordance with Stipulation VII.

2. Host an annual Cultural Awareness class for military aircrews to ensure tribal, SHPO, and federal agency cultural concerns are communicated properly.

a) Invite each Tribe, SHPO, and federal agency that has signed this PA to produce and present at the Cultural Awareness classes and offer travel and per diem expenses.

b) Include summaries of recent classes in the annual and five year updates of the EAFB Integrated Cultural Resources Management Plan (ICRMP).

IV. Avoidance Protocol

A. Within six (6) months of executing this PA, 28 BW shall develop and implement a program to accept requests from consulting parties to avoid training in portions of the PRTC.

B. The 28 BW shall consider requests from consulting parties to avoid using portions of the PRTC, said requests to include dates and approximate locations, preferably with coordinates, that should be avoided, no later than seven (7) to ten (10) days prior to the date of avoidance being sought.

V. Supersonic/Large Force Exercise (LFE) Notification

The 28 BW shall notify consulting parties fifteen (15) days prior to the use of supersonic operations and an LFE. Supersonic operations will take place only during LFEs, which occur at a maximum of ten days a year.

VI. Integrated Cultural Resource Management Plan (ICRMP) Revision

The 28 BW shall incorporate the activities mandated by the stipulations of this agreement into the procedures, goals, and objectives of the base ICRMP, to be completed by the date of its next five year update, estimated to be 2016. The 28BW shall provide draft, updated versions of the ICRMP to the parties to this PA. These parties may review and comment on the ICRMP and/or provide additional relevant information relevant to PRTC operations and historic properties as they deem appropriate.

VII. Monitoring and Reporting

A. On March 1, starting in 2015, the 28 BW shall send a request to consulting parties, except the ACHP, for information pertaining to any additional historic properties or adverse effects identified during the previous operational year of the PRTC by that consulting party.

B. Each May 1, starting in 2015, the BW shall provide all consulting parties, except for the ACHP, a summary report detailing the following:

1) the number of training exercises completed;

2) any scheduling changes proposed for military training in the PRTC;

3) any problems encountered with implementing the terms of this agreement;

4) any disputes or objections received as appropriate;

5) a summary of newly identified properties;

6) a summary of newly identified adverse effects; and

7) a meeting date to discuss the contents of the summary report.

VIII. Confidentiality

A. Consistent with Section 304 of the NHPA, 36 CFR §800.11(c), the Archaeological Resources Protection Act (ARPA), and other applicable laws, 28 BW, after consultation with the Secretary of the Interior, shall withhold from public disclosure information about the location, character, or ownership of a historic property when disclosure may cause significant invasion of privacy, risk harm to a historic property, or impede the use of a traditional religious site by practitioners.

1. Access to sensitive data, as defined in Section 304 of the NHPA, will be limited within 28 BW to individuals designated by the Wing Commander.

2. Requests from parties external to this agreement for access to sensitive data on PRTC related historic and traditional properties held by the AF shall be considered jointly by 28 BW, SHPO/THPO, Tribes, and NPS as appropriate.

B. All parties shall attempt to resolve disputes regarding access to sensitive data in a timely manner, not to exceed sixty (60) days. If a dispute regarding access to sensitive data cannot be resolved, 28 BW shall defer to the facility manager of public buildings, the land manager on public lands, the tribe on tribal lands, or in the case of privately owned lands, to the SHPO.

IX. Air Force Claims Program/Post Review Discovery

A. The 28 BW, through its Public Affairs Office, shall, in the event of damages, injuries, or complaints associated with military operations in the PRTC, accept descriptive documentation and facilitate processing to the Air Force claims program. Contact the Public Affairs Office at (605) 385-5056 between 8:00 am and 5:00 pm, Monday through Friday, or via email at 28.bw.public.affairs@ellsworth.af.mil. The Public Affairs Office will immediately notify the Office of the Staff Judge Advocate of any potential claims. The Public Affairs Office shall maintain documentation of such reports and actions taken by the Air Force in response. This documentation will be summarized in a report and made available to the consulting parties annually, beginning one year after execution of this PA.

B. In the event of the 28 BW becoming aware of a discovery within the PRTC APE of damage to historic properties as a result of PRTC operations, the discovery of previously unidentified adverse effects, or of non-compliance with the terms of this agreement by any consulting party, the 28 BW shall notify the appropriate SHPO/Tribe within 72 hours, providing a brief but detailed report. The 28 BW, after consultation with the appropriate SHPO/Tribe, will determine the appropriate response to any such discovery.

X. Duration

A. This PA will be valid for five (5) years from the date of execution.

B. At the conclusion of five (5) years from the date of execution, the signatories and invited signatories to the PA may carry out a review of the PA in order to determine if revisions to the PA are needed and to determine if the PA may continue for an additional five (5) years. If the signatories and invited signatories agree to the extension, the agreement will be documented in an amendment to this PA which will be signed by the signatories and invited signatories in accordance with Stipulation XIII.

XI. Compliance with the Anti-Deficiency Act

Any requirement established by the PA for the expenditure of Department of the Air Force funds by the 28 BW shall be subject to the availability of appropriated funds, and no provision herein shall be interpreted to require obligation or payment of funds in violation of the Anti-Deficiency Act (31 USC 1341). In the event that the 28 BW is unable to carry out one or more terms of this agreement due to the provisions of the Anti-Deficiency Act, the 28 BW shall advise the parties to this PA, and shall otherwise comply with pertinent requirements of this PA as appropriate.

XII. Dispute Resolution

Should any signatory or invited signatory to this PA object at any time to any actions proposed or the manner in which the terms of this PA are implemented, the 28 BW shall consult with such party to resolve the objection. If the 28 BW determines that such objection cannot be resolved, the 28 BW will:

A. Forward all documentation relevant to the dispute, including the 28 BW's proposed resolution, to the ACHP. The ACHP shall provide the 28 BW with its advice on the resolution of the objection within thirty (30) calendar days of receiving adequate documentation. Prior to reaching a final decision on the dispute, the 28 BW shall prepare a written response that takes into account any timely advice or comments regarding the dispute from the ACHP, signatories and consulting parties, and provide them with a copy of this written response. The 28 BW will then proceed according to its final decision.

B. If the ACHP does not provide its advice regarding the dispute within the thirty (30) day time period, the 28 BW may make a final decision on the dispute and proceed accordingly. Prior to reaching such a final decision, the 28 BW shall prepare a written response that takes into account any timely comments regarding the dispute from the signatories and consulting parties to the PA, and provide them and the ACHP with a copy of such written response.

C. The 28 BW's responsibility to carry out all other actions subject to the terms of this PA that are not the subject of the dispute remain unchanged.

XIII. Amendments

A. Any signatory to this Agreement may request that it be amended or modified. Any resulting amendments or addenda shall be developed and executed in the same manner as this original PA.

B. The amendment or addenda will become effective on the date a copy is signed by all signatories and is filed with the ACHP.

XIV. Termination

A. If any signatory to this PA determines that its terms will not or cannot be carried out, that party shall immediately consult with the other parties to attempt to develop an amendment per Stipulation XIII above. If within (30) calendar days (or another time period agreed to by all signatories) an amendment cannot be reached, any signatory may withdraw from the PA upon written notification to the other signatories. Withdrawal by a SHPO or Tribe will terminate this PA only with respect to matters within the jurisdiction of that SHPO or Tribe.

B. If any signatory withdraws from this PA, the remaining signatories shall consult and determine whether the PA shall continue in force with respect to matters within their jurisdiction. If said parties determine that the PA shall be terminated, the 28 BW must, as soon as practicable, either (a) execute a Memorandum of Agreement pursuant to 36 CFR §800.6, (b) execute a revised PA pursuant to 36 CFR §800.14(b)(3), or (c) request, take into account, and respond to the comments of the ACHP under 36 CFR §800.7. The 28 BW shall notify the signatories as to the course of action it will pursue. The parties agree that all flying activities and measures in this PA to resolve adverse effects will continue in effect while 28 BW implements its decision.

XV. Signatories

A. This PA shall be executed in counterpart, with a separate page for each signatory and invited signatory, and when combined will constitute the whole agreement. 28 BW shall ensure that each party is provided with a fully executed copy. This PA will become effective regarding historic properties in Montana, North Dakota, South Dakota, and Wyoming on the date of the last signature by 28 BW, the SHPO for each of those states, and the ACHP.

B. Additional federal agencies may be included in this PA as an invited signatory without its amendment if 28 BW notifies the current signatories and invited signatories in writing of the proposal and there is no objection from the current signatories or invited signatories within thirty (30) days of 28 BW's written notice. If no response is received within thirty (30) days, 28 BW may assume concurrence with the addition of the federal agency to this PA. 28 BW shall ensure that each consulting party is provided with an updated copy of the PA.

C. If Cheyenne River Sioux Tribe, the Crow Tribe, the Northern Cheyenne Tribe, or the Standing Rock Sioux Tribe chose to sign this PA as an invited signatory after the execution of the PA, it may do so without an amendment to the PA if 28 BW notifies the current signatories and invited signatories in writing of the proposal. 28 BW shall ensure that each consulting party is provided with an updated copy of the PA.

EXECUTION of this PA and implementation of its terms evidence that the 28 BW has taken into account the effects of the PRTC undertaking on historic properties and afforded the ACHP an opportunity to comment.

A. Entirety of Agreement. This PA, consisting of thirty (30) pages, represents the entire and integrated agreement between the parties and supersedes all prior negotiations, representations and agreements, whether written or oral, regarding compliance with Section 106 of the National Historic Preservation Act for those aspects of the Proposed Development, Implementation and Operation of the Powder River Training Complex throughout the visual APE that will or may have adverse effects on the settings of historic properties.

B. Prior Approval. This PA shall not be binding upon any party unless this PA has been reduced to writing before performance begins as described under the terms of this PA, and unless the PA is approved as to form by the Attorney General or his representative.

C. Severability. Should any portion of this PA be judicially determined to be illegal or unenforceable, the remainder of the PA shall continue in full force and effect, and any party may renegotiate the terms affected by the severance.

D. Sovereign Immunity. The State of Wyoming and the WYSHPO do not waive their sovereign or governmental immunity by entering into this PA and each fully retains all immunities and defenses provided by law with respect to any action based on or occurring as a result of the PA.

LIST OF ATTACHMENTS

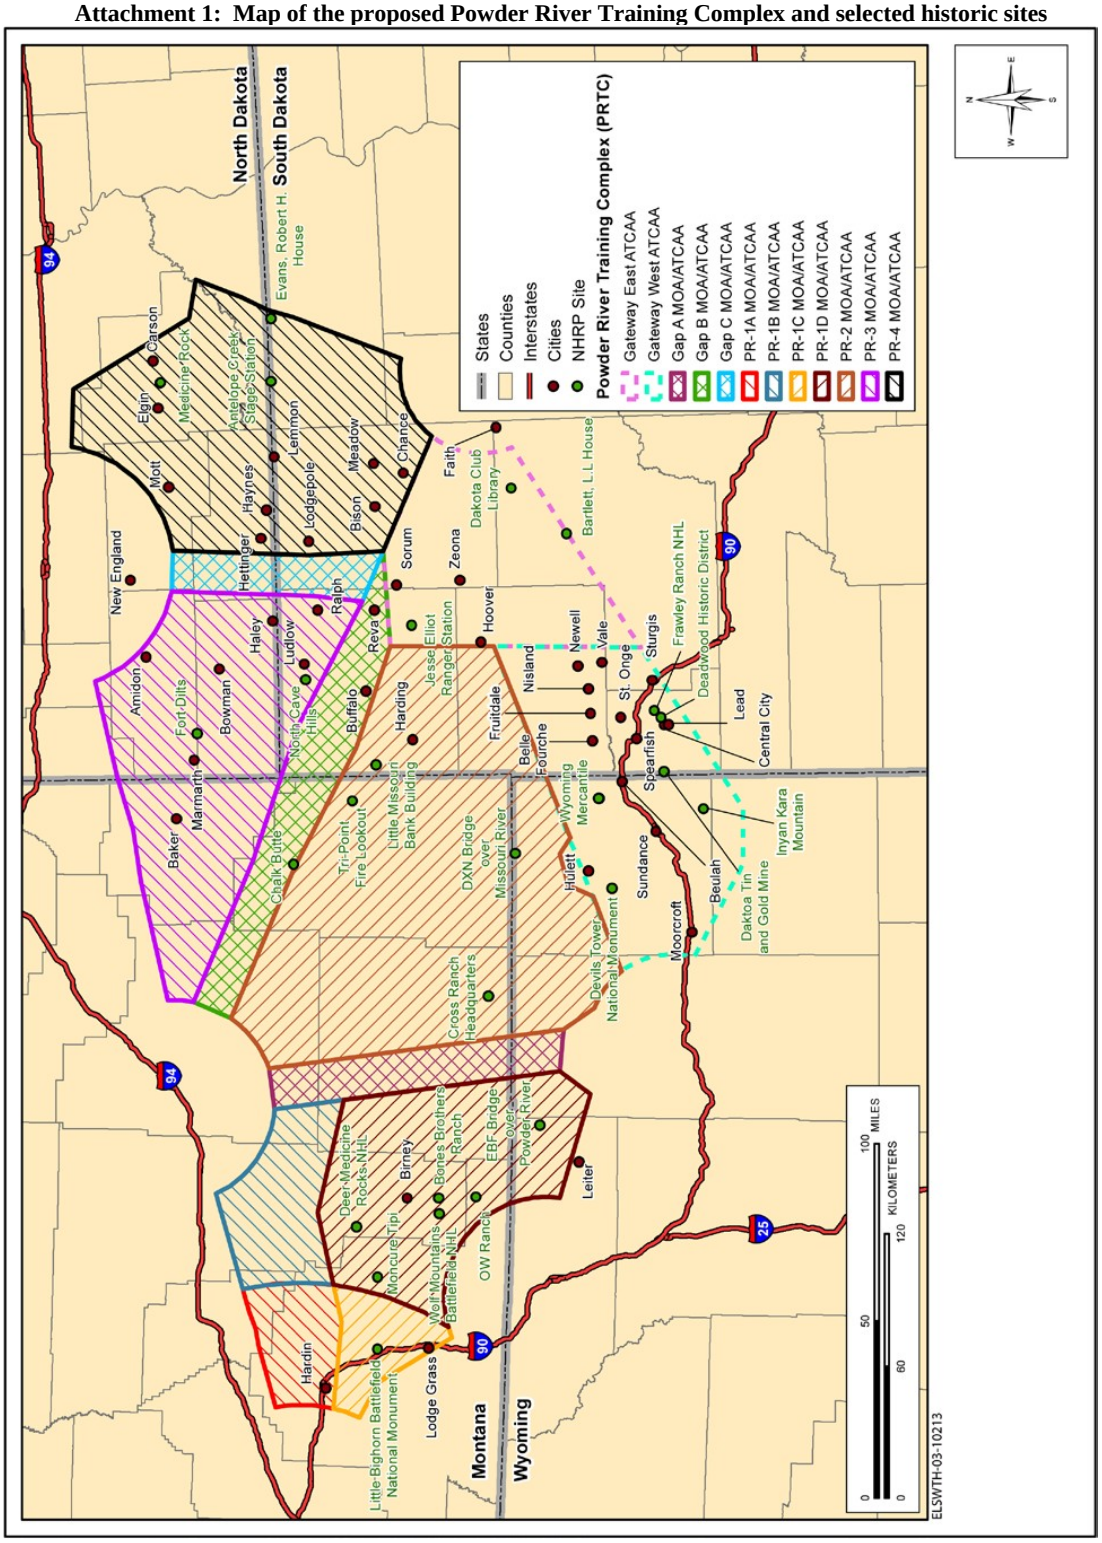
1. Map of the proposed Powder River Training Complex (PRTC) and selected historic sites

2. Proposed PRTC MOA/ATCAA Complexes

3. Table describing National Register of Historic Places listed properties beneath the PRTC airspace (in multiple sub-tables)

4. Map of the Little Bighorn National Battlefield Monument Area per Stipulation I.A.1.

Attachment 1: Map of the proposed Powder River Training Complex and selected historic sites



Attachment 2. Proposed PRTC MOA/ATCAA Complexes	
MOA	**Description**
Powder River 1 MOA complex (PR-1)	Consists of PR-1A, PR-1B, PR-1C, and PR-1D MOAs, each of which would be stratified vertically into a Low MOA, a High MOA, and an ATCAA.*
Powder River 2 MOA complex (PR-2)	Consists of the PR-2 MOAs, which would be stratified vertically into a Low MOA, a High MOA, and an ATCAA*
Powder River 3 MOA complex (PR-3)	Consists of the PR-3 MOAs, which would be stratified vertically into a Low MOA, a High MOA, and an ATCAA*
Powder River 4 MOA	Consists of the PR-4 MOAs, which would be stratified vertically into a High MOA, and an ATCAA*
GAP A MOA	Separate PR-1 and PR-2, would consist of a Low MOA, a High MOA, and an ATCAA*
GAP B MOA	Separate PR-2 and PR-3, would consist of a Low MOA, a High MOA, and an ATCAA*
GAP C MOA	Separate PR-3 and PR-4, would consist of a Low MOA, a High MOA, and an ATCAA*
Gateway ATCAA	Modified and expanded to create the Gateway West and Gateway East ATCAAs*

**Note:* For the purposes of the definitions above: Low MOA = altitudes from 500 feet AGL up to, but not including 12,000 feet MSL High MOA = altitudes from 12,000 feet MSL up to, but not including 18,000 feet MSL ATCAA = altitudes from 18,000 feet MSL up to 26,000 feet MSL

Attachment 3: Historic Properties in the PRTC APE (in multiple sub-tables)
